District 1.—In the Niagara district and the counties along Lake Erie there has been a very heavy bloom, and all varieties seem to have set well. There is little damage reported from frost in the Niagara district and in Norfolk county but there is some complaint of frost injury in the Essex peninsula.

District 2.—There has been a fine show of blossom throughout this district. It is impossible yet to estimate any damage that may have been done by the late frosts.

His Majesty King George V—Our New King.

District 3.—Pear trees have blossomed profusely in Prince Edward county and the counties along the north shore of Lake Ontario. A large crop is indicated.

There is a prospect also of a good crop in the Georgian Bay district.

District 6.—There has been a full bloom in Nova Scotia, but late frosts have made the prospects somewhat uncertain.

Districts 9 and 10.—Pears in British Columbia have set for an abundant crop.

PLUMS.

Plum trees generally have been heavily laden with bloom in the commercial plum sections of Ontario and in Nova Scotia.

The effects of the severe late frosts are not determined, though slight injury is reported to Japanese varieties in the Niagara district, and more serious injury to nearly all varieties in the Essex peninsula and Nova Scotia.

The prospects are good in British Columbia for plums and Italian prunes especially.

PEACHES.

The outlook is bright in the Niagara district. There was a splendid show of bloom. Although it was cold and wet during blossoming time, it is reported that the pollination was successful. Curl leaf is beginning to appear in some orchards on account of the wet weather early in May.

In the Essex peninsula it is reported that the peach blossoms were injured to quite an extent by late frosts. The trees, however, were so full of bloom that the prospects are still for a good crop.

The outlook for peaches and apricots in British Columbia is excellent.

CHERRIES.

Cherries blossomed well in all sections.

District 1.—In the Niagara district sweet cherries are now quite well advanced. Some damage is reported from frost, though not serious. Sour cherries have been exceptionally full of bloom, and promise a full crop. In Norfolk and Elgin counties the present outlook is for a good yield. In the Essex peninsula the bloom was heavy on both sweet and sour varieties, but damage from frost is reported in some localities, especially to sweet varieties.

Districts 9 and 10.—All varieties promise exceptionally well in British Columbia, though some damage from late frosts is reported in the interior valleys.

SMALL FRUITS.

Small fruits have come through the winter well, and have blossomed heavily.

Strawberries, raspberries, blackberries, currants and gooseberries are promising well in the Niagara district.

In the Essex peninsula and the counties bordering Lake Erie, strawberries are reported in some instances considerably injured by late frosts, particularly among the early varieties.

In Districts 2 and 3 a number of correspondents report that the first bloom of the early strawberries were blasted in the blow by frost. The later varieties are probably safe unless they should be caught by an unusually late frost.

In the Maritime Provinces, small fruits are looking well.

There has been a splendid show of blossom in British Columbia, and small fruits will be plentiful. The first consignment of local strawberries from the lower mainland were received on the Vancouver market May 21.

GRAPES.

Grapes wintered well in the Niagara district, and are looking very thrifty and vigorous. They were rather late in budding and are likely to escape serious damage by frost. All varieties are looking very promising.

TOMATOES.

Tomato plants are not so forward as usual on account of dark, cool weather. There has been considerable 'damping off' of plants on account of dull weather, and some reports of inability to fill orders.

A great many plants have been set out in the Niagara district, but some of the earliest were nipped by frost.

Heavier plantings for commercial purposes than in former seasons are reported around Leamington in the Essex peninsula.

INSECTS.

Insects are somewhat more numerous than last year at this time.

The Bud Moth is very much in evidence throughout all the fruit sections. very strong arsenical poisons will have to be used just as the buds are bursting to control the Bud Moth.

The Cigar Case Bearer has also been hard at work on apple foliage this spring. Spraying with arsenical poisons to control the Bud Moth will keep this insect in check.

The Oyster Shell Bark Louse is reported to be on the decrease where regular spraying is practiced, but decidedly on the increase where no spraying is done.

The Aphids are noticeable, but are not so prevalent as last season.

The San Jose Scale is increasing in southern Ontario, except on trees that have been kept well sprayed with lime and sulphur.

The Tent Caterpillars are very numerous in eastern Ontario, Quebec New Brunswick and British Columbia.

The Canker Worm is plentiful in Nova Scotia, but it is not so bad as last year.

A large number of nests of the Brown Tail Moth have been cut from the trees in Annapolis Valley and destroyed.

FUNGOUS DISEASES.

Peach Leaf Curl has appeared in the Niagara district, and is likely to be very bad in peach orchards not properly sprayed with lime and sulphur.

Pear Blight is showing already.

Black Rot Canker is prevalent in District 3.

The European Canker, which has become a serious menace to fruit trees in Nova Scotia, is said not to be increasing as rapidly as usual this season.

FOREIGN FRUIT CROP PROSPECTS.

Great Britain.—The season, on the whole, is earlier than usual in Great Britain. There has been an abundance of bloom on all varieties of fruit. The latest reports received indicate a prospect for at least an average fruit yield in England, though the weather was very cold during the latter part of April, and damaging May frosts are always probable.

United States.—In the Ben Davis group of states in the middle west, the apple crop will be very light on account of the severe frosts late in April. There has been also heavy damage to fruit in Michigan, Ohio and Colorado. It is asserted that sufficient bloom was left uoharmed to predict a fair crop, though considerably below the average.

The prospect for the apple crop in the New England states is very good. Late frosts did some damage to early varieties of apples, but the later varieties were not far enough advanced to be injured.

There was some injury in parts of New York State to pears, plums, cherries and early apples, but on the whole very little damage has resulted from frost in the states of New York and Pennsylvania. In the latter state indications for a good apple crop are reported.

The prospects in Oregon and Washington are reported promising for a crop above the average.

DIRECTIONS FOR SENDING SPECIMENS.

Orchardists are urged to examine their trees and plantations very closely for insect and fungous pests. Specimens of insects, if dead, should be wrapped in paper or cotton and inclosed in a pasteboard box. If the specimen is particularly soft it should be packed in cotton saturated in alcohol. Whenever possible grubs caterpillars and so forth should be packed alive in a box together with a supply of their food; air-holes are not necessary. Particulars as to where the insect was found and the nature of the damage which it is doing, whether to leaves, buds or stems, are frequently of very great importance. Send for information and identification of specimens to:—

Dr. C. Gordon Hewitt, Dominion Entomologist, Central Experimental Farm, Ottawa.

The Fruit Districts of Canada.

Those who would get full value from the Fruit Crop reports, would do well to study closely the nature of the crop in each of these districts.

District 1.—Grows a large quantity of apples of good size, fine color and excellent quality. Their one defect is that frequently even the winter varieties ripen so early in the fall that they deteriotate very materially before the cold weather of the early winter sets in and, therefore, unless they are placed in cold storage as soon as they are matured they are apt to show a large amount of waste if any attempt is made to keep them during the winter months. The apples, therfore, in this district must, for the most part be regarded as fall and early winter varieties unless cold storage facilities are provided to enable the holding of them for winter shipping stock. Consequently, if it should appear that there was a large crop in District No. 1, it would not materially affect the quantity of winter shipping apples, but would be counted in with the fall and early winter apples of the other districts. To this we might make the possible exception of such varieties as the Ben Davis, Stark and similar varieties that are very little grown in this district.

Her Majesty Queen Mary—Our New Queen.

District 2.—Grows excellent winter apples. It is far enough north, or the elevation above the sea level is such, that the winter varieties like the Greening, Baldwin, Spy and Russet, ripen just as the early winter sets in; consequently, these varieties may be picked and stored with advantage, as winter shipping apples in ordinary storage.

A very marked peculiarity of the district is that orchards, though numerous, are small. The district is a very large one and apples can be grown to perfection in any part of it; but the farmers are engaged, for the most part, in mixed farming. At three or four points selling associations have been formed, and wherever these have been organized apple growing is exceedingly profitable.

District 3.—Grows an equally good quality of winter apples; but the orchards are larger and the fruit-growers are taking better care of them. Pruning, spraying and cultivating are common. The varieties planted are fewer in number and confined almost exclusively to winter apples.

Another significant feature that must be taken into account in the future apple reports is that planting is being done quite freely in District No. 3. The number of young trees under ten years old probably exceeds the present plantings. Consequently, each succeeding year there will be a large addition to the aggregate of the crop coming from District No. 3 as the result of new orchards coming into bearing. There will be a tendency, therefore, to underestimate the crop from this district on this account.

District 4.—This district has a large quantity of apples of the Fameuse and Wealthy type. Te climate is too severe for the standard winter varieties grown in Ontario. The varieties, such as the McIntosh Red, Wealthy, Wolfe River and a number of other hardy varieties, are all fall and early winter apples. In estimating the apple crop, therefore, consideration must be given to this fact, that a large crop of apples in District No. 4 will materially affect the market only during the fall and early winter months, and even in such cases the apples grown in this district are more desirable for desert purposes than cooking purposes. They, therefore, occupy a special position in the market.

District 5 has comparatively few trees. The quantity of fruit raised here is not enough for home consumption, so that it need scarcely be taken into consideration in an estimate of the crop for commercial purposes. This district includes New Brunswick. The possibilities of orcharding in the St. John valley are so great that there is a probability in the future of having to make a separate division of this part of district 5 to secure greater accuracy in the estimate.

District 6 is an exceedingly important one in apple production. It includes the four counties of Hants, Kings, Annapolis and Digby in Nova Scotia. It would be quite possible, considering the high state of cultivation in which a large number of the orchards are kept, to have a surplus of five or six hundred thousand of barrels for export.

It will be readily seen that this is a very important fruit district in estimating the marketable crop for any particular year. The Gravenstein forms the largest bulk of their earliest shipments. This variety, however, is being less planted, and the district is becoming more and more confined to the winter shipping varieties. The Blenheim Orange type appears to flourish here better than the varieties so successful in districts 1, 2 and 3. These are extremely popular in the English market, and, therefore, are always likely to be in good demand.

District 7 embraces the rest of Nova Scotia not included in District No. 6. A few isolated and protected valleys, particularly in the counties of Lunenburg and Digby, are demonstrating their capacity for growing fruit in commercial quantities; but as a whole it may be said that there is not enough winter fruit grown for home consumption, nor is there sufficient quantity to affect appreciably any results obtained from the other divisions.

District 8 includes Prince Edward Island. There is a small quantity of early fruit grown here for export, which may increase somewhat in the near future, but it is not enough at present to appreciably affect the market. This district still imports winter fruit for home consumption.

District 9 includes the valley of the Fraser from Lytton southward, the lower coast line and the Island of Vancouver in British Columbia. This is a mild and moist climate. favorable to fruit growing which is carried on under very different conditions from those prevailing in District No. 10.

District 10 includes the interior valleys of British Columbia, which have a comparatively dry, warm climate. Irrigation is required in many of these valleys, and it is therefore desirable that they should be grouped together, inasmuch as though they differ among themselves slightly, yet for commercial purposes the fruit is similar.

Districts 9 and 10 are becoming much more important factors in estimating the total crop of the Dominion.

THE MARITMIE FARMER

And Co-operative Dairyman.

Semi-Monthly Journal devoted to the interests of the farmer of the Maritime Provinces.

Official Organ of The Farmers, and Dairymen's Association of New Brunswick; The Nova Scotia Farmers' Association The Nova Scotia and P. E. GOOD SCHOOLING IN THE COUNTRY.

This country is often advertised as a land of opportunity. And to a great many people, the majority in fact, it has been as good as its promise. But there is one class of its citizens to which, in one respect at least, the prophecy has scarcely been fulfilled. It can be honestly questioned if to the average country boy or girl of school age this has been a land of opportunity.

It is true that difficulties of education are inseparable from pioneer experience. We cannot expect to have all the advantages of higely organized society in a day. At the beginning, in any rural community, there are certain obstacles that must be faced. Farms are scattered, and many of them are occupied by men who have no children; roads are unimproved, and money to build school houses and pay for teaching is hard to raise.

But have not the difficulties of pioneering been frequently made an excuse for poor schooling advantages even after they have served their day as a real reason for lack of proper facilties? In other words, are there not many districts that might have much better schooling privileges than they have, if the residents only honestly faced the issue?

We think so. We believe that in many country places there is the need for an awakening all round on this question. It should begin with the parents. The fathers and mothers of the children of school age could have moderately fair school privileges in almost any district, if they went at it in earnest. Do they take a real interest in school affairs? Do they endeavor to inspire the teacher by manifesting enthusiasm over the way she is doing her work rather than depress her by criticism? Do they encourage the trustees in the feeling that any effort they may put forth is worth while? Do they try to make the school grounds and the school house commodious and attractive? Is the school well equipped? Is it the place where any capable teacher would delight to work; or is it unattractive and depressing? Some schools would give the blues to any teacher that had ambition.

It is not grumbling nor is it discussing an idle question to put forward these queries. It is the natural duty of every father and mother to give their children as good an education as is reasonably possible. Yet some people seem to carry their burden of responsibility on this question altogether too lightly. They keep a boy or girl out of school to work at home if they think that he or she can do twenty-five cents worth of labor. And it is not on the farms of poor parents alone that this is done. Put into plain English, these parents steal from their own children their natural birthright. The road to learning seems to inflect too heavy a charge. Yet it is true that ignorance demands a higher toll of any family than does education. Isn't this true?

We believe that a better day in rural education is at hand. We look forward to the time when there will be more consolidated schools, which will give a better service than most of our small country schools are now doing. Then, too, the teachers are being better trained. And gradually the standard of school equipment is being raised. There is going to be a more practical turn given to much of our highschool work.

This is all very encouraging, of course, but after all, it does not get rid of the stubborn fact that in many places farmers are not permitting their children properly to enjoy even what limited school advantages there are already in existance.

If there is to be any permanently better basis for agriculture, a large part of the more substantial work looking toward the improving of conditions must begin right here. If farmers as a class are to be leaders in legislation or in social or economic reform, their capacity for leadership must, as a general principle, be based upon fundamental intelligence. Any man can see that this holds true in connection with his own generation. Will it not, even to a greater extent, hold true in regard to the next generation as well?

BE SOMEBODY.

The world is wide. If you wish to be somebody "pitch in." The brave always have friends. Where others have gone you can go. If the old track doesn't suit you, make a new one; somebody will walk in it. Don't hurry too fast, especially till you know the road or become acquainted with your team. Mind your own business and look after it yourself. Don't stop to gossip. You may grow weary, but remember this is not a world of ease, and rest lies beyond.

Success is never obtained in a country like this without effort. If you fail once, try again. If you fall down, get up. If it is dark, strike a light. If in the shade, move around; if there is a shade on one side there is sure to be sunshine on the other. It takes longer to skin an elephant than a mouse, but the skin is worth something. Never be content with doing what another has done—excel him. A trade is a good thing to have; it is better than gold—brings a larger premium, but to make a premium, the trade must be perfect. Determine in your mind to be a good workman. Never slip your work. Every job you do is a sign. Poor signs are against success. People always speak well of a man who minds his own business, and who seems disposed to be somebody. This is a queer world; many people are watching us, and help often comes when and from whom we least expect. Confidence is the safe in which men often deposit rich treasures, and as you prove worthy so will your reward of success be.—Canadian Workman.

THE SUCCESSFUL FARMER.

Ever and anon we hear of the successful farmer and in imagination we wander away to broad-tilled acres, large red barns, large houses with beautiful lawns, fine stock, etc., etc., but we do not stop to consider the enormous amount of real hard work that was entailed in bring about this condition of things. There are no hard and fast rules whereby success can be assured in this great profession, but there are certain principles that make for success and to these the following bear loyal tribute :

I shall name a few elements which a farmer cannot well do without to be successful. Make arming a specialty. I have been farming for twenty years, and I never have found much time to devote to any other profession, I have stuck close to agriculture and stock raising, and I think I have been rewarded for it. I well remember when I was a small boy, of hearing the saying "Jack of all trades and master of none." Ever since I have kept that in my mind. I would rather be a special somebody than a general nobody. The different sciences are so deep and wide that one person cannot master them all, or even many of them.

A successful teacher makes teaching a specialty, a successful lawer makes the legal profession a specialty. I know there are some good farmers who are lawyers, good teachers who are farmers, and goood farmers who are doctors, but if you should ask them if they thought they would not be more succesful if they should make their chosen profession a specialty they will tell you yes. The most successful men we have today in any profession are specialists. This is an age of specialists.

Many times since I have been farming, other things have been presented to me with offers of good wages, but I could not spare the time off the farm, which needes my undivided attention. The right thing needed to be done right at the right time, which if I failed to do, and do well, my work was not satisfactory to myself. I believe the keynote to success in farming is to do the right thing at the right time. I have never well done anything but that I was rewarded, and well pleased with my work.

THE DEMAND FOR GOOD STOCK.

The demand for good stock is increasing, is the causal remark from the breeder, and the dealer and fancier. This, in a measure, can be substituted by the increased number of breeders of pure-bred stock.

There is merit in pure breeding, in pure-bred animals, and in the effort to build up and advance quality in these animals. It is being done each year, the standard is getting higher, with the really meritorious breeders. How is it with the cross-bred breeder; what has he to show? Where are his results? Has he got a fixed type of animal produced from his cross that is creditable or that he is proud to own, or has he been spending his time and efforts in producing a scrub?

When a breeder or fancier becomes an experimenter, gets a beef idea and a dairy idea into his head at the same time, and to such an extent that he is persuaded to cross a beef breed and a dairy breed of cattle in order to secure a better individual or a better combination, he is only lending himself and his efforts to the creation of scrubs.

It is not necessary that one have a scrub to produce a scrub. This can be done readily by using pure-breds of different breeds, and the greater the divergency in the type and character of the breeds used, the better and quicker the foundation is laid for scrub breeding. It is this cross-breeding experimentation that is responsible for the present day scrub and the holding back of a more rapid improvement in the general stock of the country.

THE FARM DIARY.

We know a young man, now engaged on his own account, who served some time as a pupil under a successful practitioner. When he started as a pupil he was advised to keep a diary of the various operations that were performed day by day, and being a careful lad he did. According to his own testimony, when the young man first started farming for himself there was no book in his whole library which he found as useful as the diary he had kept when a pupil, and we willingly accept the statement. In our opinion, not only is it advisable for pupils to keep diaries, but experienced farmers also, because it is always helpful to be able to turn up a record and see when certain operations were performed the previous year. It is impossible to keep the whole details of a farm in one's mind; but if one jots down the principal operations as they are performed there is always a record to refer to. A diary suitable for the purpose can be obtained for a few pence, and the making of the entries does not involve much time nor a great deal of trouble.

Percy Moore B. S. A..
Dairy Commissioner for British Columbia.

Nova Scotia Boy Dairy Commissioner for British Columbia'

The subject of the above sketch is Percy Moore, B. S. A., son of S. J. Moore, Truro, N. S., the popular Maritime representative of the Seed Division, Ottawa.

Percy Moore was born and brought up on a well equipped and successfully managed dairy farm at Shubenacadie, N.S. Quite early in life he took an active part, with his father, in the various phrases of work incidental to growing feed, feeding and caring for a pure bred herd of dairy cattle. He spent two years on the staff of the Travelling Dairy School in Nova Scotia where his practical demonstrations and suggestions were well received as coming from one who had done the practical work that links so well with thery.

He spent two years at the Nova Scotia Agricultural, College which is doing so much for our young men who remain at home and for those who go abroad. A certificate of graduation from the Nova Scotia Agricultural collegeis a recommendation for any young man who takes the proper care of himself and who is willing and anxious to advance and do what is right.

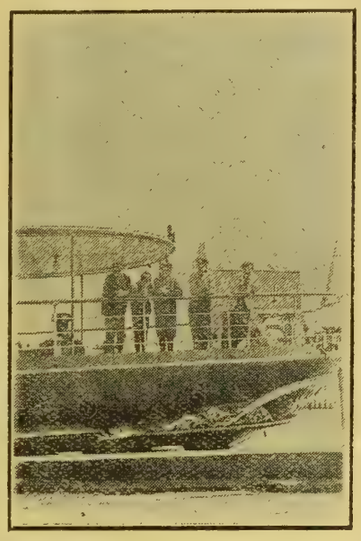
After completing the course at the Nova Scotia Agricultural College, Mr. Moore spent a summer as manager of the St. John branch of the Maritime Dairy Company, t after which he took a two year course at the Ontario Agricultural College, Guelph, from which he received the B. S. A. degree in 1909, after which he received an appointment on the Agronomy Staff of the South Dakota Agricultural College where he spent the past year and where the "Come up higher" ca l reached him from British Columbia, where he now holds the position of Dairy Commissioner. (A good example for other young men to follow). While we would like to see young men of Mr. Moore's calibre remaining in the Maritime Provinces we are glad, yea proud, to see our young men stepping forward. We congratulate Mr. Moore on his appointment and feel confident that his cheerful disposition, his practical experience and his college training will win many friends for him and make his work a success.

Blackleg of the Potato.

Professor W. J. Morse of the Experiment Station at Orono has published Bulletin No. 174 from the station, giving an account of a new disease which is appearing to a limited extent among potatoes grown in Maine. Prof. Morse gives the following summary of this disease in his bulletin which we re-publish in full.

"Blackleg is a bacterial disease of the stem and tuber of the potato. A similar appearing malady caused by bacteria has been reported from Canada, and another from England, Germany, France and other parts of Europe. Preliminary studies of the organisms associated with the disease indicate that they are closely related to those already described as a cause of similar troubles elsewhere, but whether they are identical with any of the described species of bacteria is not fully determined.

"The attacked plants are usually unthrifty, light green or even yellow, and undersized. The branches and leaves have a tendency to grow upward forming a rather compact top, often with the leaves curled and folded up along the mid-rib. The most characteristic thing about them is the inky-black discoloration of the stem, at or below the surface of the ground, but frequently running up the stem from one to several inches above ground. The seed-piece from which the attacked plants spring is invariably attacked with a soft-rot



Aboard the Northumberland.
One of the Charlottetown Steam Navigation Boats.

and the disease appears to start on the stem at its junction with the diseased seed tuber. The germs of the disease are capable of causing a rapid decay of the young tubers, and these are sometimes attacked also.

"The evidence thus far obtained indicates that blackleg is largely distributed by means of germs carried in wounds, cracks and decayed areas of seed tubers. On acconnt of the readiness with which the organisms are killed by drying there is little to fear from sound, smooth stock, but this should be treated with a disinfecting solution as a matter of precaution. There is some reason to think that blackleg was introduced into Canada from England and from there to the United States.

—"Blackleg is apparently becoming quite widely distributed throughout the eastern part of the United States. In most States it is not common enough to attract attention, and in no region has it done much damage, although it may become a serious pest in some sections. It is not believed that it is likely to do much damage in Maine, except in low, wet soils or during abnormally wet seasons. The similar appearing trouble caused by Bacllius solanisaprus Harrison is widely distributed in Canada and is there claimed to be of considerable economic importance as a cause of tuber decay.

"The propogation and spread of the disease probably can be controlled largely by tne selection of seed from fields free from the disease, the rejection of all seed tubers which have wounds, cracks or decayed areas and treating the remainder with corrosive sublimate or formaldehyde solutions, or with formaldehyde gas as is done for potato scab. It is not known whether or not the disease germs will remain alive in the soil to infect future crops of potatoes, but as a precautionary measure the land on which the disease occurs should be kept in grass, clover, cereals for as long a time as possible before planting it to potatoes again."

Swamp and Muck Soils.

Of late years cousiderable attention has been given to the study of swamp or muck soils, including the chemical compositing, manurial treatment, reclamation and permanent improvement. In the province of Ontario alone there are thousands of acres of such soils, many of them valueless and abandoned, others let unreclaimed, large areas under cultivation but yielding poor crops, whilst others again are some of the richest and most productive soils. The economic importance of this question, will, therefore, be clearly recognized when we remember that according to the report of the Ontario Agricultural Commission appointed in 1881 "to enquire into the Agricultural Resources of the province of Ontario, the progress and condition of agriculture therein and matters connected therewith," almost every township is reported to have some such land, the estimated acreage varying from a few hundred to 40,000 or more. In the aggregate, there must have been hundreds of thousands of those swamps.

Owners of such land will be interested in Bulletin 178 of the Ontario Agricultural College, since it deals with the "Character and Treatment of Swamps or Mucky soils." The bulletin is prepared by Prof. W. P. Gamble and A. E. Slater. A brief summary of the bulletin follows:—

I. As a whole, most swamp soils can be made to be some of our most fertile

I am a Prince Edward Islander
My dad is a Maritime Farmer Subscriber.

lands, if properly drained and cultivated.

2. That potash and phosphoric acid are usually more or less deficient, and that the soils readily respond to an application of commercial fertilizers.

3. All attempts at the cultivation of peaty soils begin with the drainage.

4. Certain crops are particularly well adapted for growing on these soils, while others do uot do so well.

The following suggestions may be of value as briefly summarizing much that has been dealt with in the bulletin:—

1. A deficiency of potash (K20) and of available phosphoric acid (P205). both of which frequently need to be applied in the form of commercial fertilizers.

2. An abundance of nitrifying germs which act on the inert nitrogen present in the organic matter and convert it into ditrates, a form readily assimilated by plants. The application of farmyard manure or garden loam is needed in this case, together with frequent cultivation,

3. A water-logged condition owing to the permanent water table being too near the surface, and thus checking root development, and preventing areation of the soil. Lower the water table by efficient drainage.

4. A dry loose condition of the soil which results in lack of moisture through inability to raise water by capillarity. This condition frequently results from too rapid drying out of deep areas of muck. Gradual draining is desirable.

5. The laying of tyle in the muck itself, which results in imperfect action of the drain, owing to the inability of the water to penetrate into the drain through the pores of the tile.

6. Acidity, owing to the presence of an excess of organic acids. This condition is not common with Ontario muck soils. Liming is the remedy.

7. The presence of injurious plant poisons in the soil, as the lower oxides of iron. Frequent cultivation and exposure of the material to the air results in oxidation and removes the evil.

8. An undecomposed condition of the soil and the presence of much woody fibre, and thus a general coarseness of the soil particles. Frequent cultivation and the applicatlon of farmyard manure has a beneficial action, hastening decomposition.

8. The lodging of grain and a light and poorly filled ear, due to the excess of nitrogen over mineral constituents. An application of potash and phosphoric acid is beneficial.

Scab. Early and Late Blight.

The early blight, late blight and the scab annually cause considerable loss to the potato growers of Maritime Canada, and hence it is very important that the treatment of seed potatoes previous to planting should be more generally understood.

POTATO SCAB.

The main source of this disease is generally scabby seed and like most fungus disease when once carried to the soil it spreads very rapidly. There is no doubt that many potatoes which leave the field quite free from the disease become infected in the place of storage by spores from tubers on which the disease had developed in the field. As potato scab spores will retain their vitality in the soil for as long as five or six years, it is not unusual to plant clean seed and still harvest a scabby crop.

TREATMENT OF SCAB INFECTED SOILS.

It is important to remember that the best results from the treatment of the seed cannot be expected unless reasonable precautions are taken to keep the soil clean. Bags, baskets, boxes, barrels, and implements that have been in contact with scabby seed or infected soil should be thoroughly disinfected

(Continued on page 573.)

A Couple of Prince Edward Island Braves.
Prince Edward Island Still has a few Scattered Colonies of Indians.

The Apple in Commerce.

In referring to the apple, or any other product of the country, as contributing to the credit of commerce, it would be well to give some consideration as to the vital importance of commerce in its ruling position in all public affairs. Its paramount issues cannot be overestimated. The life of the nation is nourished and sustained by wholesome fruits of the enterprise and industries emanating from commercial circles. The work of controlling the commerce of any country enlists aid from the strongest intellects and clearest mental perceptions associated with the highest order of executive abilities.

When apples were first grown in this country the idea of commercial orchards had bot been conceived. The fruit was grown, and then in very limited quantities, for fqmily use. If Johnny Appleseed, who travelled with his bag of seeds, which he scattered and planted years ago through the Middle West, could be made to realize the fruits of his humble endeavors he no doubt would be astounded at results.

We trace a similar course when following in the wake of the apple in commerce. Starting from smallest tiny seeds, which in many instances were dropped only by accident, slowly and surely came a forming and spreading of the roots obtaining firmest holds on the fertile soils; then came the rising of tender plants, swelling in strength of trees and in time spreading branches laden with fruit fit for the Gods.

While the advent of such advantages were warmly welcomed, the propagating of the trees at the start was only for the purpose of supplying family wants and luxuries. Gradually the sphere of services widened. Sufficient number of trees were planted to bring more or less of a revenue for farmers from neighboring markets. A steady demand for the fruit called for orcharding on larger scales and passing years have witnessed planting of large and countless commercial orchards in available apple belts all over the country. If the exact area covered by orchards in the United States could be given no doubt a great surprise at its extent would be witnessed. In order to furnish stock for new orchards a peremptory demand was made for nurseries, which are again occupying large tracts of the most fertile and arable. Taking the land for orchards, nurseries, homes for fruit growers, and for erection of the various and diversified buildings required by the apple industry in the country it would reach millions of acres.

It would not be possible to trace the tributaries of all currents through which millions flow like grains of sand as they come with sweeping force swelling the strong tide of the apple in commerce, flowing and spreading into every nook and corner of the country. It can be readily seen, however, that its powerful and increasing and voluminous force is boomed by billions of best American money.

In viewing the trial balance sheet of the apple in commerce for the past several years do we not see figures that are almost paralyzing in their effects? Turning back to 1896 figures show that the annual crop for United States for that year was 69,000,000 barrels. The largest annual crop since that date was in 1900, when 47,000,000 barrels were harvested. There has been a general failure of the crop in the aggregate in the passing years, and the closing year, 1909, shows 23,000,000 barrels the lowest degree reached by the descending mercury registering each annual public report.

What can be said about progress, development and advancement in the face of uncontrovertible figures? Probably there is fifty per cent. more capital invested in all courses of the apple in commerce now than in 1896 and then the approaching census will no doubt show that we have nearly 15,000,000 more to feed at home than in the year mentioned; added to this is the annually increasing foreign demand for American fruit, which steadily grows in favor on the other side of the ocean.

Bear in mind we are discussing the general output of the apple crop and not the result of intelligent and industrious individuals who stand and shine as beacon lights in all directions of this vitally important industry. We concede apparently overpowering obstacles have caused many defects. It can be truthfully said, however, that there is no royal road to success, neither in industrial pursuits nor professional careers of any character. In all strifes for existence we must either conquer or surrender.

It is not necessary to say that I have been referring to the annual apple products in the aggregate. We are not unmindful of the crowning success worthily won by the wisely directed efforts of a countless host of individuals. Without the rich rewarding of their earnest toil it would not have been possible for us to enjoy the magnificient pictures, grand results, placed in the most alluring light of all beauty and loveliness before our eyes to-day. But where are the thronging multitudes of failing orchardists who must go to the left, and to be generally left before the tribunal from which there is no appeal?

A conservative estimate would place about 75 per cent. of the American orchards as being too nearly barren to be profitable, and that means many millions of trees in different parts of the country existing only as cumberers of the ground. The owners of such orchards are rarely or never seen at a national, State or local horticultural meeting. They are somewhat like the sinners, who standing in the greatest need of salvation, are never seen inside of church doors. Those careless and indifferent fruit growers have no conceptions of the benefits and enjoyments conferred and enhanced around fires of enthusiasm that kindle and brightly burn at the national apple display we are witnessing. It is to be hoped that those present will return home bearing torches of enthusiasm, so well replenished with oil of hope and encouragement they will be able to throw clearest guiding lights for those groping and stumbling very far from paths of peace and safety.

Reflecting over consequences of the many dismal failures of apple culture years ago I suggested the importance of observing one day of the year as national apple day, making the date the third Tuesday in every October as that would be near the general average of time for harvesting the crops. The general recognition of the event has surpassed my most sanguine expectations. Nearly every national, State and district horticultural organization has cheerfully concurred and given the sanction of approval. During the short period of five years the observing of the annual anniversary, in some form or manner from the Atlantic to the Pacific, has been fruitful in results, although seeds dropped on different soils on that date may not have developed in wholesome vigor until months have passed. Such a state, however, should be commended. While we have Sunday set apart especially for religious teachings we should offer no objections whatever to the man who should happen to be moved by a good impulse, and should act in a becoming manner, though even for a while on one of the ordinary week days.

Future generations will be alert in applying far advancing methods in growing the great varieties of necessary and wholesome fruit. Then if perchance, the mines should be exhausted, a more concentrated attention will become fixed in developing fruit, the far greater wealth of the country and for which resources and opportunities are unlimited; then myriads of happy homes from which shall continually arise songs of contentment and blessing shall cover all present unoccupied districts, and in such centres will rise institutions establishing truth and justice, religion and piety, as crown jewels radiating all that sheds refining and elevating influences in the walks of life. Then the people will behold beautiful banners with the insignia of the apple blossom for our national flower, and exalted in foremost ranks, with brightly illuminated colors inspiring zeal, or highest aims and loftiest ambitions, will be delineated "apples of gold in pictures of silver."—An address to the Colorado National Apple Exposition by James Handly, Quincy, Illinois.

How a Michigan Orchardist Prunes Old Apple Trees.

The way not a few go at orchard pruning is enough to make a man cry out "don't." Singularly enough the branches that are most easily reached seem to be the ones on which the attack is made without much regard for the exigencies of the case or, apparently, a very clear idea of which ones should be taken. The effect of this general custom is to be seen in the greater part of the older apple orchards one sees, where the lower limbs are largely cut away and the tops of the trees are run up high in the air. Such trees are very difficult to reach with the sprays, and it is equally difficult and expensive to gather the fruit, if by chance any happens to mature.

These thoughts have been impressed upon the writer's mind by a thorough experience. An apple orchard recently came under his control that is probably fifty years old or more, and in which this same practice had been followed, so far as any pruning has been done. Fortunately, that work has been neglected, so there is now a better chance to bring the tops within a working distance from the ground. Last fall in gathering the apples it became necessary to lash two ladders together, one 24 feet long and the other 14, making a ladder probably 33 feet high. Two men were required to raise this into the trees, and then only a small number of apples could be reached before it became necessary to remove the ladder. And even this failed to reach the top of the trees in many cases. Only one man could work on it, but the time of both was required much of the time in order to move the ladder as needed. It cost 75 cents per barrel to put those apples up, whereas in other orchards where the trees were not so high the expense was only 40 cents. Those tall trees were partially beyond the reach of the spray pump as well, and the quality of the fruit suffered in consequence.

Now instead of following the common custom we are cutting away those upper branches and trying to bring those tops down where we can spray them and where the apples can be gathered at less expense. Of course, where the tops have become too thick, some of the lower branches that have been shaded are dead and must be cut away, but in the main there are enough thrifty limbs to make good tops lower down.

A thing that should be guarded against in these old orchards that have been neglected is excessive grafting when the branches were cut away to allow the scions to grow. I have seen pear trees killed after pruning. It is not the best policy to undertake to do all of the work that may be needed in a single year. Better take at least three years to bring the trees into proper shape. Some kinds of fruit trees, like peaches, seem to stand pruning, but not so with either apples or pears. I once saw a job of pruning done in an

Nitrate of Soda

The Modern High Grade Straight Fertilizer

Cheapest, Cleanest

Odorless

Can be used anywhere on any crop

Convenient for use

$3.00 worth of Nitrate on an acre of Grass has given an increased crop of 1000 lbs. of barn-cured Hay. Effective alone or as a supplement to other fertilizers.

Prime hay has sold for $25 per ton in New York this season.

Books on the crops which interest you will be sent free.

Thorough Spraying With "VANCO" Lead Arsenate

will hold in check the Codling Moths, the potato Bugs and all the other leaf-eating insects that take such heavy tolls on your crops.

"VANCO" Lead Arsenate is sure death to the bugs, and it sticks so well that one spraying will retain its effectiveness far longer than if Paris Green were used.

It is easy to spray thoroughly with "VANCO" Lead Arsenate because it does not settle quickly in the spray tank, does not clog the nozzles, and shows so plainly on the foliage that you can tell when you have covered the whole tree or plant.

Price 10c. per lb. according to quantity.

"VANCO" Spay Chemicals are High in Quality and Lowest in price. Made in Canada, by practical men, and offered on their record.

Club your orders and save on freight

"Acadia" Lime-Sulphur Solution

Manufactured right in the fruit growing district to supply the needs of this Valley. Although this is the first season "Acadia" brand has been on the market, it is being used exclusively by the best orchardists in Kings and Annapolis Counties. Write at once for price and full particulars to

T. L. HARVEY.
Wolfville, - - N. S.

apple orchard where the lower branches were severely cut away after the common practice, and an old fruit man who chanced to be passing remarked that those trees would stand a chance of being barren for three or four years. His prediction proved true. I once rented an apple orchard of 160 large trees. It was the bearing year, and as the pruning had been neglected I argued that a thorough pruning before blossoming would relieve the exhaustion incident to a heavy bloom, as well as helping the fruit generally, so we gave them a good clearing out. Those trees blossomed well and set a promising crop of apples, but they began to drop soon afterwards and a very light crop matured, not enough to pay expenses, and I lost money on the deal. Other trees that same year that had not been so severely pruned, though otherwise given practically the same care, bore a good crop. A person may, indeed, secure a good crop of apples following a heavy pruning, but he takes chances in doing so, and in general the trees seem to resent such severe treatment. So it is wise to be moderate in this work.

Besides cutting down the tops we are cutting back the side limbs and shortening them in. In order to be able to reach all parts of the trees and do a thorough job of spraying it is necessary to keep the trees within a reasonable compass. After studying this matter for some time I have concluded that an apple tree can be grown as large as can be well handled within a limit of two rods and leave room between the trees for driving around. So in planting out new orchards I am setting the trees two rods apart each way. Where land is valuable as orchard lands are in these parts it is not economical to set trees farther apart than is necessary.—Edward Hutchins, in Michigan Farmer.

Better Care of the Orchard

If one were to judge by the neglected state of most apple orchards, such as are to be found in almost all sections, where general farming is practised, he would think that apple growing was about the last proposition that one should enter into. And where orchards are looked after as is the usual practice, it is, to say the least, doubtful whether or not returns are secured from these sufficient to justify their existence. We know, however, from actual experience—and countless men in this country and in many others of the province have proved it to their satisfaction—that the apple is a money maker if given the care that its proper cultivation calls for.

There are few farmers but recognize the advantage of pruning. A lot of them, on the other hand, have yet to find out that it pays to spray. Even many of those who do spray go about the work in a shiftless sort of way, their main purpose seeming to be to empty the barrel rather than to spray the trees properly. The apple crop is proving to be a profit maker with many of our leading farmers. All can make this crop as profitable as those who by virtue of up-to-date methods have succeeded in making it a leader.

Any farmer located in a district suitable to the growth of the apple tree might do worse than to consider the advisability of planting out more land to orchard. Our constantly expanding markets for the right kind of apples bid fair to remunerate all those of sufficient foresight to see the ulimate harvest that may be reaped from a good orchard. It is useless to plant an orchard, or even to maintain the old one, unless we give it proper care, and above all spray.

The principle part of every meal should be good Homemade Bread — made of "Beaver" Flour

There is more health and strength—more energy—more real food value—in good homemade bread, than in any other one article of diet.

Bread is the only food that alone will support life for any length of time. Good Home-made bread—made of "Beaver" Flour is the least expensive food—is the only food you can relish and enjoy three times a day, year in and year out—the only food that agrees with everybody and does everybody good.

The more bread you eat, the less will be your cost of living, and the more you will live healthfully.

The whole problem of economical living is solved when you eat more bread—wholesome, nutritious, delicious bread—made of "Beaver" Flour. Your grocer will supply it.

Should Hide Their Heads.

Unscrupulous agents pretend that complicated cream separators can be washed by "sousing 40 to 60 disks as one piece." The April 13th issue of a leading dairy and creamery paper contains statements from prominent creamerymen who condemn "sousing." The following extracts from these statements should make unscrupulous agents hide their heads:

"Wash machines every time they are used and not use the 'sousing' method advised by agents of complicated machines—this method being very injurious to cream." David W. Hodges.

"I have seen cheap separators it was an impossibility to clean. The greatest trouble is caused by misrepresentation, regarding work necessary to keep machine clean, by agents whose sole purpose is a sale." Glen Overton.

"A dirty and unsanitary farm separator is the start of bacteria it is hard to overcome." J. M. Taff.

"It has been demonstrated by tests that it does not pay to have the separator partly clogged with filth." L. C. Shepard.

These statements should decide you to get the only simple, sanitary, easy to clean cream separator—the

LIVE STOCK.

Watering the Show Herd.

Frequently the successful fitter of show stock is lauded to the skies by both the press and the public for his successful manipulation of the feed pail. Perhaps the credit is due the water bucket rather than the feed pail, but always it is the feed pail that gets the credit. To understand the why of it, take the case of range cattle as an illustration. The grass for many miles about the water holes is eaten into the earth. They soon acquire the habit of coming to water but once in six or seven days. When once they do come to water they drink and drink till they have to stop from sheer misery. Then they retire to some near hillside where they rest and ruminate until they can return and drink again. They may lie about the water holes in this fashion and drink and rest and drink again for two days or even longer. When they trail out for the grazing grounds again their systems are so thoroughly saturated with water that they do not have to return again for three or four or even five days. Similarly in the fenced pastures of Texas, cattle will not visit the water tank oftener than once in two days even in mid-summer. This is true even though there is a water tank placed on every section.

It is the same thing that the fitter has to contend with in his show herd. If left to themselves his charges will usually drink once a day. There are a few that in summer will drink every twelve or eighteen hours, but there are others, not a few, that if allowed to take their fill will not drink oftener than from thirty-six to forty-eight hours. With range cattle or farm stockers this may be allowed, but not so with even steers in the feed-lot. But take the case of the show steer. Roots, bran and chaffed hay are added to his ration until it attains twice the bulk of that of the steer in the feed-lot. Then the show steer is fed three or four times daily and fed only what he will clean up, so his appetite is kept always at a keen edge. There is no room in him to hold a two days' supply of water, for no sooner is his punch emptied of one meal than it is filled with another. Take such a beast as this and allow him to tank up with about twenty gallons of water every day and the result is disastrous.

The trouble has two ways of manifesting itself. One result—and the least harmful—is scouring. The animal is thrown off feed for a few days and when a few days later he is ready to tank up with water again he is not so full of feed and so there is more room for water and less trouble follows. But scouring is followed with costiveness, and so the gain of a month is lost in a week.

The second result, more serious but less frequent, is founder; and "been feeding to heavy," or "too much corn" is the advice of your sympathizing neighbors. At the show the fitter says: "Oh, he was a poor feeder; wouldn't gain over thirty or fourty pounds a month," or "He took something like the rheumatism and I had to turn him out."

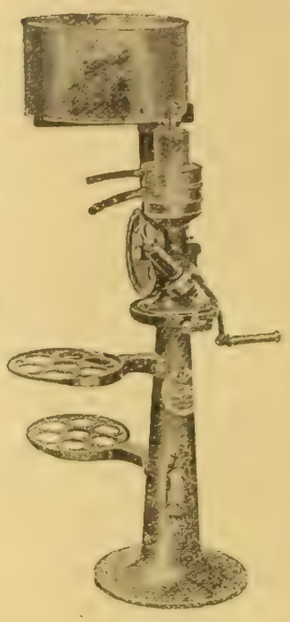
It is all sheer nonsense to say that a beast accustomed to all he will eat three or four times daily for months can be foundered by eating too much. More than nine times out of every ten when the show beast is scouring, off its feed, costive or has gone lame, the trouble is caused by over-drinking, not overfeeding. And with such a beast your success depends less on how and what you feed than on how you water him.

To water wisely, the first thing to do is to teach your charges to drink from a pail only. The lesson is a hard one. Some cattle will obstinately refuse to drink from the pail for three or four days where they have been accustomed to drink from the tank only. Surely no animals are greater slaves to habit than cattle. But there are sometimes no tanks on the fair grounds and it is a poor time to teach new habits when the show day is on. Besides they should drink from the pail at home. Then you are in a position to restrict the morning drink enough that they will drink again at noon. Do this with judgment; see to it daily; let nothing suffer for water but let nothing drink too much at once. Remember that on your skill with the water bucket depends your reputation as an adept at the feed pail. As to how often to water—it must be at least twice a day through early spring and autumn and three times daily through warm weather. In theory it would be best to water as often as you feed. But if you feed four times daily you will find it hard to make your cattle drink so often, especially in cool weather.

Last and least comes the question of when to water. With the horse, having but one stomach and a small one at that, it may not matter whether he be watered before or after eating. Even here, however, experiment stations have reported in favor of both plans, But while the horse has one small stomach, the ox has four large ones. The majority of fitters both advocate and practice watering before feeding, but that very astute stockman, Thomas Clark, of Illinois, has advocated that the show cow always be watered after feeding and he has given very good reasons for his theory. Personally I have tried both plans. If one plan was better than the other my observation was not acute enough to notice it. But a change from one to the other was usually marked by a slight disturbance in gains and appetite. The idea is to water wisely, water well, then you may hear of your skill with the feed. —Breeders' Gazette.

CAPACITY---DOLLARS!

A VITAL POINT FOR THE PROSPECTIVE BUYER.



To clearly illustrate this important question:—

To separate 100 lbs. milk (10 gals.) with a 350 lb. capacity separator, you must operate it about 20 minutes.

To do the same work on a 500 lb. capacity separateor it takes but 12 minutes.

You Save 8 Minutes

in time? Yes, but that's not all. In wear? THAT'S IT. Eight minutes in wear every time you separate 10 gallons of milk.

The Capital

is small in appearance alongside of other makes of EQUAL CAPACITY because of its simple yet strong construction and its "easy to wash" bowl, separating 500 lbs. of milk per hour. Weighs less than four lbs.

That's Why.

our competitors put in a machine of but 250 to 350 capacity for a few dollars less money and lead you to believe you are getting a cheaper machine.

Test the Capacity

The Original "HALLOCK" Weeder.

The object of a weeder is to keep down the weeds, therefore, it resolves itself into this one fact: that a weeder should be used early and often, so as not to give the weeds a chance to grow. You will not injure your crops by working the ground directly over the plant or grain, but will do much toward increasing the growth and yield.

You can work them in dry or wet weather, they will not cut the roots of the crop, but cultivate just deep enough to retain the moisture just where it is needed. But, do not forget the old rule—Use the WEEDER early and often, and when you are all through with all kinds of other cultivators, our weeder will finish your job in No. 1 shape. Thousands in use. Write for prices and terms.

Send in your order now for the "HALLOCK" Weeder. Goods are now in hand, all orders will receive prompt attention.

Some Suggestions on Out-Crosses and In-Breeding.

I do not deem an out-cross a violent one, even though not the most remote relationship exists, if only the out-crossing animal is identical in type, rendered so by some generations of ancestors of similar conformation and character. Such out-crosses are most desirous, and if the breeder could always obtain them there would be no necessity for in-breeding. On the other hand, any animal of the line, however near he may be related, if the type is wrong, the cross, with him, is more or less violent in degree, dependent upon the remoteness to the type he represents in his make-up.

Type to type, with an ever watchful and zealous effort to improve health, constitution, feeding qualities and character, is the motto that I would adopt, and let relationship take care of itself in the main; but, when possible, introduce unrelated animals to compromise with the project we all entertain, regarding near relationship, but never sacrifice one single iota of the original purpose of individual stamp for an out-cross that may do incalculable harm in the way of set-backs that will take years to correct.

I have been wholly unable to see how animals of perfect health, perfect digestion, perfect form, perfect disposition, perfect reproductive powers and prepotency, can deteriorate, however much they may be in-bred, if only all these attributes are kept intact by proper care and attention, always discarding those that are not so endowed, if by accident they happen to be produced from the breeding herd.

The most successful flock of Lincoln sheep I ever bred were lambs out of ewes with a common sire. I hazarded the risk because the ram was great in all essentials and very prepotent. These lambs were subsequently bred to unrelated sires and the best results followed, in that the most desirable attributes of the old sire were manifest in the out-crossed off-springs; and the flock has continued to this day to breed back his type, leaving out the individual make-up, in a great measure, the characteristics of the intervening sires, and I have recently made up my mind to cast about for a son of the old ram, in the hope that I may more securely fasten his good points onto the flock. It is needless to say that the son must possess unmistakable evidence of perfect health and vigor of constitution.

It is a dangerous thing to select sires haphazard, and I think I would advise, if I advise at all, that the breeder with ambition to be a leader should not go outside of his own herd to get them, but I would have him deliberately set about to breed them for his own use out of the best he has at hand from animals whose capabilities and breed qualities and prepotency are a part of his intimate and certain knowledge, based upon a close scrutiny for years together.—H. M. Brown in Indiana Farmer.

Trouble With Pigs.

It is drawing near the time when we may expect the annual lot of letters enquiring as to what to do with pigs when they are losing the use of their legs. It seems too bad that so many otherwise farmers do not learn that lack of experience is in most cases the reason for pigs losing the use of their limbs. Pigs cooped up in a little 7x9 pen, with not any too much litter for a bed; and where five or six are in a pen of this size it is impossible for them to get exercise unless they take to jumping over each other. The natural result is that they do not grow as they should and after a time begin to wabble on their legs.

There is not a better paying class of stock on the farm than the hog, when it is properly taken care of; but until the farmer himself will learn to handle his pigs right all the commissions to Denmark or elsewhere is just that much money wasted.

Sheep Notes.

Under average conditions sheep are more economical meat producers than steers.

The quality of mutton is more in the feed than in the breed.

If you desire the best returns for feeding, make your lots of fat sheep as evenly as possible.

Breed the ewes so as to have the lambs just as early as your circumstances for caring for them will permit.

The man with worn or thin lands to enrich can use sheep to better advantage than he can any other animal.

The Secret of Larger Yields.

The whole secret of larger yields of milk is that a cow is considered to make milk from her whole system, devoting all her energy to the work. She has, as it were, a storage battery storing up energy whilst dry, and strengthening her whole system. The feed fed whilst a cow is dry often has more effect on large production than that feed fed, at the time she is producing heavily. A cow's stomach can easily be overloaded. A cow that is fed too much and is bilious and sick is not likely to produce so well as if fed just enough to satisfy her.

Many cows are knocked out by over feeding. It is impossible to say how much a cow should have to produce the best as so many cows have to be fed and considered as individuals. A cow when she first freshens must be considered as an individual. Owing to the tax of motherhood her stomach will not be so strong and she must be fed very judiciously for a couple of weeks. Considering the demands of motherhood in itself no little tax upon the cow besides producing heavily, we see how absolutely essential it is to give a cow the very best care and feed at all times. It is necessary if we expect good work from the cows to fit them for the work.

TWO MONTHS REQUIRED TO RECUPERATE.

A cow should be dry two months or more yearly and whilst dry is the time to feed her for the next year's work, to strengthen her up. This is an essential point in managing dairy cows. But it is not followed. Not well enough understood what a tremendous tax it is upon a cow to produce milk yearly? If we want say 7,000 lbs. of milk from a cow consider that she is providing 2,800 quarts of milk equal in value to that many pounds of beef. How important it is to recuperate her system. Furnish her with energy for the next year's work whilst dry. Is this often done? On the contrary cows are dried up often not to feed them up and recuperate them but to save feed on them. The result is a poor cow, poor in energy, weak, when she should be strong. So long as the present system or lack of system prevails we cannot hope to get large yields.

A cow to give large yields must be bred with the inherent ability to devote her energy to milk production. The ability is of no use unless she has the energy. This can only be secured in a good measure whilst the cow is dry. It is well known cows do not give the same quantity of milk each year. It will depend upon what fettle she is in when freshening. Sometimes a cow will not get in as good condition as we would desire. It may be that the pasture has been poor and the cow has run herself down more than we made allowance for. She may have milked so heavily she has not recuperated properly. But the greatest cause of a poor condition is that no attempt has been made to put her into condition. Hence low production is sure to follow.

THIN COWS REQUIRE 2 YEARS TO GET INTO SHAPE.

It is well known by some dairymen who are considered good feeders, that it is necessary to feed a cow that has been in poor hands two years to get her system strengthened up so that she will be able to do her best work. She will likely give considerable more the first year of good feeding, but it takes two years to bring her to her maximum production. This shows that the milk does not come directly from the feed, but as the energy is built up in the cow she is stronger and is able to do greater work.

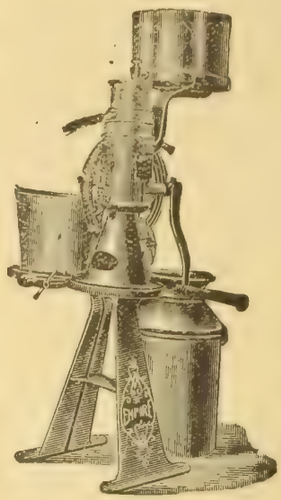
Of course it is important that a cow should be fed well when she is producing else she will draw more largely upon her bodily energy and when she has depleted her system she will have to shrink in her milk flow. However, it is always injurious to feed a cow too much or overload her stomach. We want cows that are constitutionally strong, and we must do all we can by judicious feeding, and care to keep the cow in as good fettle as possible.

But since with the very best care and feed we can give a good cow, will draw upon her system and deplete her energy, it is necessary to have her dry long enoygh to replace this energy. It is because this is not done and cows are fed so poorly whilst dry that we see such poor results. There is no use of a man asking for a ration when a cow is fresh. A man needs to know how to feed her whilst dry as well as all the year round. The best way to teach that is to show the tremendous energy that the milch cow expends in producing milk.

Effect of Food on Milk.

This perennial subject forms the basis of one of the best papers read at the B. D. F. A. Conference. Dr. Russell has focussed present knowledge on the theme in an admirable way, but at the same time there is still much to be learned. The burden of his paper was missed by most of the subsequent speakers. It was an appeal to the every-day farmer to come to the assistance of the scientific investigator, by furnishing a fuller area of facts than has yet been placed at his disposal. The broad facts disclosed in Dr. Rus-

Farmer Agents Wanted

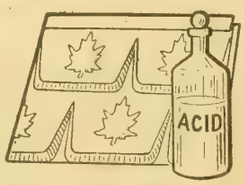


We want a farmer in every locality to act as our representative. No experience necessary. No financial obligations to be met before starting to draw your commission. All notes, etc., are looked after by us.

District representative will call and instruct. Every assistance given in making a sale. The **Empire Cream Separator** is the easiest to clean, easiest to turn, and easiest to sell of any separator on the market.

A card or letter written us today will be attended to at once. Just now, between planting and harvest, you will have a breathing spell—why not make a few dollars? No loss of time from your farm work, no investment, no travel, and no fault finding after machine has been placed. No better proposition has ever been offered you. Write today.

The Empire Cream Separator Company of Canada, Limited
SUSSEX, New Brunswick.



They Pass The Acid Test Easily

The sheet metal the British Government buys for public works must be able to pass an Acid Test more severe than twenty years of Canadian weather.

PRESTON Safe-Lock Shingles are the only shingles made and galvanized according to British Government Specifications. They easily pass this Acid Test. They are practically everlasting—the most durable roofing in the world.

PRESTON Shingles are the only shingles SAFE-LOCKED on all FOUR sides. They are proof against rain, snow, fire, lightning, and wind. Canada has not yet been visited with a gale strong enough to unroof a single building covered with PRESTON Safe-Lock Shingles.

So positive are we that PRESTON Shingles are lightning proof that we will give you a Lightning Guarantee Free of Charge. And with PRESTON Shingles you can reduce your fire insurance rate by about one-half.

While the first cost is about $1.00 more per 100 square feet, PRESTON Shingles are five times as durable as prepared roofing or wooden shingles. The cost per year of service of PRESTON Shingles is only one-fourth to one-third as much. PRESTON Shingles are the only roofing material good enough for that new barn of yours.

King Street Factory. Please send your booklet, "Truth About Roofing." I am interested in roofing and would like complete information about PRESTON Shingles.

sell's paper do not seem to us to modify the accepted views on the subject. What he calls the law of diminishing returns (unhappily, a law with which farmers are quite familiar!) explains a good deal. The cow can only take a certain amount of food. Consequently, if less be given less will be available for milk secretion, because the upkeep of the body must first be conserved. But just here a difficulty arises. All cows are not alike. The individuality of the cow comes into play, and some cows will continue to give milk even if they be starving and losing weight. Farmers could greatly assist the investigator by taking pains to observe and collect good rations, with their effects upon cows. In America much more has been done in this way than in this country, but even there the data is insufficient. The only thing that seems to be certainly demonstrated is that there is a point beyond which a cow cannot be fed so as to modify the quantity and the quality of her milk. If this were not so, there would be no milk standard difficulty. If the standard could be sustained by feeding there would be no defence for selling milk below 3 per cent.

As an historical review of the subject, Dr. Russell's paper is invaluable. His critical analysis of the successive experiments leaves little to be desired. This is true specially of the well-known Copenhagen experiments, which, confirmed in Germany, America, and England, formed the basis of the belief that the composition of the milk was independent of the ration, and that, no matter what food was given, it was impossible either to increase or to lower the percentage of fat. One defect in these experiments, however, was that they did not offer any ration which at all approached the heavy rations of watery material fed to cows in the ordinary course of farm practice. A farmer must feed his cows with what he has. He may know all about the albuminoid ratio, but his knowledge is of small use to him if his farm produces a vast amount of food which sets the albuminoid ratio at defiance. He must consume the food his farm grows, and he often cannot afford to purchase sufficient concentrated food so as to make his feeding scientifically accurate. It is undoubted that the quantity of milk can be affected by the character of the food. but it is not yet proved that the quality of the milk can be so affected. Of course, it stands to reason and common-sense that if the volume of milk yielded by a cow be increased by feeding, the percentage of fat and solids in her milk will be diminished; but it is not proved, and we suspect it cannot be proved, that the actual total of solids and fat can be affected one way or other.

The experiments conducted by Dr. Van Rijn, gave a result which he did not anticipate, but they proved that the most influential factor affecting the milk supply was the individuality of the cow. He wanted to discover whether the milk supply would be affected by the change of habitat of the feeding cow from the byre to the meadow. He turned two of his three groups of cows, after a lengthened test in the stalls, out to the meadows, and then found that it was not the milk of the cows whose diet had been changed, but the milk of the cows whose diet had not been changed, that underwent the change. The nervous condition of the cows which remained in the barn injuriously affected their yield of milk, while the change of food in the case of the others had no effect. Surely this is proof that the individuality of the cow has more to do with the quality of the milk than her food. Everybody knows that a milking animal is a peculiarly sensitive piece of machinery—that it is the easiest thing possible both to lower the quantity and to disturb the balance in the quality of the milk by disturbing the cows, or putting them into unfamiliar situations or surroundings. Old-fashioned dairy folks, whose scientific knowledge was very limited, were familiar with that fact, and acted accordingly.

It Satisfies

A paint that looks and wears well is bound to attract the attention and favorable comments of your next door neighbor —just as paint that fades, peels, and chalks off in a few months is bound to attract their attention and condemnation as well.

Martin-Senour Paint 100% Pure

Meets every requirement of a *good paint*—it shows its quality in the can and as it flows from the brush, and months afterward *there it shines*—a testimonial to the honesty and skill of its makers.

The luckless house owner who depends on the fickle protection afforded his property, through the use of a cheap adulterated paint, will soon find himself bluffed and vanquished.

A house protected by *Martin-Senour Paint* can enjoy the thousand shrieking voices of the wind, while you listen from the vantage ground of your well shielded home.

A *Good Pure Paint*, while defending your home, renders you far greater service -it adds greater comfort, health, protection, cleanliness; besides it saves your buildings from emptiness and decay.

If your dealer cannot supply you, notify us and we will gladly direct you to where our paints are to be had.

How Tuberculosis is Introduced Among Cows.

A Wisconsin dairy herd of forty-six head, all appearing healthy were sold to divide the interests of landlord and tenant, says Dr. H. L. Russell, Dean Wisconsin College of Agriculture the former retaining eighteen head of what he thought the most valuable animals and then buying three. The herd was dispersed to twelve persons, eleven of whom thus introduced tuberculosis into their herds, for thirty-two of these cows were found to be infested the tuberculin tests being given by State Veterinarian, E. D. Roberts. None of these animals showed any outward appearance of the disease and no one suspected its presence at the time of the sale. The post-mortem examinations showed it had made only slight headway. However, it had begun to spread in the five months following the sale. Its accidental discovery was most timely, to prevent the spread of infection from the twelve centres.

And this is the story of how it happens right along. We didn't have tuberculosis a generation ago because we were not buying from the outside. We have been seeding the disease by the interchange of stock. In the early stages it was spread by the pure-bred stuff. The speaker knew one such herd which had spread tuberculosis to sixteen other herds in four states. One man lost $3,000. The public auction has been a still more potent factor than private sales in thus spreading death and destruction, until now our grade herds are in worse condition than pure-bred cattle.

Out of 363 diseased herds found in Wisconsin tests, 263 herds, or more than 72 per cent. had acquired the disease by purchase. What more positive proof could one want of the spread of tuberculosis through the interchange of animals from herd to herd?

When a man buys a tuberculous animal he could better afford to take it out and knock it on the head than to take it into his herd and let it spread the disease.

The practical lesson growing out of this knowledge is, never buy cattle to take into a herd unless they are subjected to the tuberculin test.

Clover makes the cows give milk. See that you have a supply on hand for next winter.

Dairy Notes.

A few roots or a little extra oil meal will aid cows in shedding old hair.

Feed the lice coal tar dips rather than allow them to feed upon calves.

A little bone meal added to the salt will keep cattle from gnawing the mangers and fences.

Weigh and test the milk of your cows and see which are filling your pocketbook.

Among the chief grafters of the times are round, fat cows, that eat, but pay not.

Each cow should have her regular milker.

The grass looks green long before the cow can get a mouthful.

Winter fat prices are what make you smile.

The poor milker eats nearly as much as a good one.

Sit on the stool, don't pound the cow with it.

The wild cow is almost invariably a small milker.

The calf pail should be kept as cleanly as your own cup.

Frequent changing of breeds is inviting the weak points in each.

There is as much need of a balanced man to feed the ration as there is of a balanced ration.

The more sheep you can keep and keep right the less per sheep will the cost of keeping be.

Rightly managed the ewe from a good sheep will pay all expenses of keep and leave a profit besides.

THE HORSE.

Clipping Horses.

It is very commonly found advantageous to clip horses partially only, instead of having the whole of their coat removed. This plan is very usually adopted with heavy cart-horses used for town or road work, as well as with many horses of the light draft horse class, such as vanners, contractors' horses, 'bussers, etc., which perform their work at a slow trotting pace, while tradesmen's cobs and ponies are also frequently clipped in this fashion. In the case of horses and ponies which are kept standing about in the open a great deal in the course of their work, and which in consequence are much exposed to cold and yet, partial clipping certainly proves most useful, and may, therefore, be recommended. The advantage which such partial clipping possesses in these circumstances over the usual method of clipping the whole of the body consists in the fact that the horse continues to enjoy a certain measure of the natural protection against the cold and rain which the winter coat affords, while at the same time it also to some extent experiences the benefit and relief which clipping confers. It will, of course, be readily recognized that a partial removal of the coat does not afford the same full measure of relief to the horse as is secured by clipping it all over. Considerable diversity of practice prevails in regard to the manner in which partial clipping is carried out. In some cases a larger area of the horse's body is clipped than is done in others. No hard and fast rule can be laid down on this point, as it to some extent depends upon circumstances how much or how little of the coat should be removed. Very usually, when partial clipping is adopted, the horse is clipped "trace-high," as it is termed—that is to say, the lower part of the body is clipped from below an imaginary line drawn along where the traces will come when the animal is harnessed to a vehicle, while the coat above that line is left untouched, the unclipped parts thus including the upper portion of the shoulders, ribs, flanks, and quarters, the back, the loins, the croup, and the neck. The legs are, as a rule, left unclipped in partially clipping a horse, and rightly so. The ideas of horse-owners do not, however, always fully coincide on the question as to what exactly constitutes "trace-high" clipping, and in having their horses done in this fashion some prefer that the dividing line between the unclipped and clipped portions should be rather high up, while others like it to be low down. This "trace-high" style of partial clipping is a most suitable one to adopt in the case of heavy and light draft horses which are worked wither at a walk or at a slow trotting pace and perform an average amount of work, inasmuch as the clipping of the coat on the belly and lower parts of the body will afford them sufficient easement and prevent them from being inconvenienced by the coat's weight, while the upper portion of their body will be fully protected against the inclemencies of the weather. But in partially clipping horses of the heavy or light draft types whose work is of a particularly exacting nature, or such as have to go at a fairly fast trotting pace, hardly sufficient relief will be afforded them if clipped merely trace-high, and in these circumstances it will probably be desirable to clip a large area of the body. One must take into consideration the nature of a horse's work, and also the pace at which it is worked, in deciding how much of its coat shall be removed. The more exacting the work is, especially in regard to pace, the larger a portion of the coat should be clipped, so as to give the animal an adequate degree of relief from its weight. Only very little real benefit accrues from partial clipping if an unduly large proportion of the coat is left unclipped.

The parts of the body which stand most in need of protection against cold and wet in horses are the back and the loins. The latter in particular are a sensitive region, and more susceptible to being chilled than any other portion of the horse's anatomy Hence, when the practice of partially clipping a horse's coat is resorted to, one should, at any rate, always leave the back and loins unclipped, and considering the exposed position of these parts, and the peculiar susceptibility of the lumbar region to chill, it will readily be apparent that there is considerable advantage in allowing them to retain their full natural protection against cold and rain in the cases of horses and ponies which are kept at work for long hours and have to stand about a great deal in all sorts of weather in the course of their work. With horses that are worked mainly at a medium trotting pace, an excellent mode of clipping them partially is to leave only the back and loins unclipped, while removing the coat from the rest of the body, including neck and head, but excepting the legs. To clip the coat off the upper portion of a horse's body and leave the lower part unclipped, as is sometimes done, is foolish, such a style of partial clipping being opposed to all common sense. Rather than do this, it is better not to clip the horse at all, or else to remove the whole of its coat. The real essence of the system of partial clipping is to leave the most exposed and sensitive parts of the body—i. e., the back and lumbar region—unclipped, so that they may enjoy full natural protection, however much or little of the coat on the other parts of the horse's body is removed.

The Well-Matched Farm Team.

An impressive fact is the scarcity of well matched farm teams. There is a very strong demand for such teams and one who possesses one usually has several standing offers for them either from neighbors or city buyers. A few men appreciate the value of a well matched team, but as a rule the average farmer pays slight attention to the proper matching of his horses.

Many a team is considered well matched which, in reality, is not so. The work of putting together two horses that are enough alike in all characteristics to work in harmony is an ist not to be despised. There must be a similarity in style, action, general conformation, appearance and color to produce the well matched pair. The best results are usually obtained when horses are paired soon after being broken. There will then be more of a tendency to grow alike in action and less danger of developing irritable dispositions. Habits in horses as in men become more fixed with age.

Considering that all other points are medium in perfection there is no quality which adds or detracts so much from the value and appearance of a team as action. If they move with snap and vigor, are stylish, steady, straight and balanced there is no feature so attractive to the buyer or so pleasing to the driver. It matters little how well the team meets the other requirements if the action is unlike, one horse up on the bit and the other with the single tree rubbing the tire. The annoyance is so constant that it demands an extraordinary control of the driver's temper.

Strength and conformation are points next in value. Some teams will start out well matched but after working a short time one will lag far behind. Strength is indicated by a short, deep middle, close coupled and well muscled over the loin. Loose joints and flabby muscles never indicate staying power. Disposition often influences a horse's ability to do work. A nervy, high strung horse will often keep up on the bit after he has become tired.

Size is important, though it can be sacrificed when other points correspond. A difference of a hundred pounds in weight does not materially detract from the value and appearance of a team. A difference in regard to color is the least objectionable feature in a team.

A well matched team is a pleasure to handle and creates pride in the farm and brings respect from all who see them. It will sell for a good price and advertises the farm in a desirable manner. The effort required to obtain a well matched team will be well paid for.MA. J. Bredvold, in Farm, Stock and Home.

Colt Following Mare.

Under almost all circumstances it is better not to allow the colts to follow the mares. Colts suffer an undoubted injury from following doggedly along mile after mile with their dams in the field or on the road. Everyone who has allowed colts to follow is familiar with the tired lifeless habit they develop. A stiff spiritless gait, an unshapely, thin body and stunted growth are common faults of such colts. They have literally been put to work practically from birth and their constitutions are not equal to the strain. A colt cannot work and grow as he should all at the same time. The exercise he would naturally take in a day is only a small fraction of the amount he takes in following the mare. Then, too, the work of following along at a walk in the fields does not bring all his muscles into play as does a jumping, tearing, romp with his body twisted and squirmed into a hundred contortions. Moreover, a colt is a great hindrance in the field; he gets lost or follows some other team away on the road. When the team is doing light work that does not tire the colt he is continually into mischief and is liable to get hurt. Again at the most inconvenient

POULTRY.

Scrofulous Poultry.

Scrofula is really a form of tuberculosis, and, indeed, it may be said that the only difference between the two is that the former shows itself in eruptions and sore places externally, whilst tuberculosis lurks in the lungs and other internal organs, and its presence is not generally recognized until it has taken a fatal hold of its victim. Scrofula usually appears as a running sore, which may be on the breastbone or on the joints of the wings or on the leg, but wherever it appears it is always difficult to cure; and it is this difficulty in getting it to heal up that shows a wound to be of scrofulous tendency. In the first place it is quite certain that a bird which is suffering from anything of this kind is not fit to be used as a stock bird. It is curious to notice that birds which have been bred from when suffering from scrofula have been known to produce chickens which have died off of tuberculosis in the lungs, and this shows the intimate connection that I have already referred to between scrofula and tuberculosis. Some breeds of poultry are much more subject to the complaint than others; the explanation of this is that of late years, with the increase of poultry exhibitions and of competitions to win prizes thereat, there has been a disposition to indulge in what is called in-breeding, the object of which has been to fix certain exhibition points. This is a practice which is, of course, altogether destructive of health, and the poultry farmer who is anxious to promote what is called utility qualities in his stock should be very careful to avoid purchasing any which come from a strain in which anything of the kind has taken place Many breeds of poultry have been absolutely ruined for utility purposes by this breeding for exhibitions, and there is no better example to be found than that of the old black Spanish, which at one time had the reputation of being the most productive of all breeds, but which to-day has altogether gone out of fashion, its place having been taken by modern varieties.

Now as to dealing with a case of scrofula when it occurs. The first essential is to keep it perfectly clean. To this end it should be bathed twice a day at least with warm water containing a small quantity of permanganate of potassium, which is antiseptic in its nature and will thoroughly cleanse the wound or sore. This having been done, apply a small quantity of carbolised vaseline, and apply a pad or bandage so that the bird cannot interfere with the place, and do not allow it to perch, but make it rest on straw. Some internal medicine should be given at the same time, nothing being better than an occasional dose of Epsom salts, which can be dissolved in a little warm water and poured down the throat, and at the same time the bird should have a little Parrish's chemical food in the drinking water, which acts as a nutritive to the bird and tends to discourage any scrofulous tendency.—By "Mid-England" in Feathered Life.

Charcoal for Fattening Poultry.

In a recent issue of the Journal of the Irish Board of Agriculture, it is stated that the Board have been furnished by Mr. H. de Courcy with an account of some experiments carried out by him for the purpose of deciding the exact value of charcoal as a means of keeping birds that are closely confined in good health during the period of fattening. Eighteen large, healthy Aylesbury ducklings were selected from a large flock, and divided into three pens, each pen containing six ducklings of as uniform weight as possible. Each batch of six ducklings weighed fifteen pounds, or an average of two and a half pounds per head. Throughout the experiments the ducklings were fed upon foods which previous experiments had shown to be profitable and ecomomical—namely, boiled potatoes, barley meals, ground oats, skim milk, and tallow greaves. The method of preparing the food was to boil, strain, and pound up the potatoes, which before boiling would constitute about ane-third by weights of the mash. Barley meal and ground oats were then mixed in equal parts and mixed with the potatoes. Skim milk was added to form a rather wet mash. This was fed to the ducklings from the end of the fifth to the beginning of the ninth week. During the last two weeks of fattening, animal food in the form of rough fat or tallow greaves was added to the mash, the allowance being about two ounces per day to each duck. Grit and water for drinking were liberally supplied. Apart from the charcoal the food received by all the ducklings was the same.

Tables were given as to the results of the trials, which show that charcoal in one form or another is essential in the profitable fattening of ducks. It appeared to keep the ducklings healthy, and enabled fattening to be continued with profit for a much longer period than when charcoal was not allowed.

The experiments with geese were conducted on similar lines, and gave almost identical results. The breed was the Embden-Toulouse. The foods fed to the geese were the same as those fed to the ducks, except that they got steeped oats instead of mash for the evening meal, mash being fed in the morning. The charcoal fed to both ducks and geese was burnt wood, broken fine.—Irish Homestead.

Killing Poultry.

Of the many methods of killing poultry that of bleeding the bird has come to be considered the most satisfactory. It has the advantage of removing all the blood from the body without leaving any unsightly wound. If the operation is properly performed all the blood is drained from the body, leaving the flesh of a white color.

The birds should be fasted for 24 hours before killing. Several hours after the last feed allow the birds all the water they can drink. They should then have a complete fast until they are killed.

To kill the birds by bleeding secure a stout cord to the ceiling of the killing room and attach to the end, which should extend down as low as the operator's shoulder, a piece of iron, preferably a large burr. When ready for killing, the birds may be suspended on this cord by simply giving the cord one wrap around the legs, pass it over itself and allow the burr to drop. Hung in this way it is impossible for the bird to become detached, and it can be more readily bled while suspended.

Te bleed, place the left arm over the bird, grasp the bird by the neck near the head, with the thumb on the throat. By a gentle pressure of the thumb force the mouth open exposing the arteries on each side of the mouth. With the right hand insert the knife so as to sever first one of the arteries, then the other. Next pierce the brain by passing the knife through the roof of the mouth towards the top of the head and give it half a turn. Both arteries must be severed in order to insure complete bleeding, and complete bleeding is the only means to prevent the flesh from turning red. The successful piercing of the brain is characterized by a peculiar flutter throughout the body. The plucking is much more easily done if the killing has been properly performed.

To catch the blood and save the annoyance of its being scattered about, attach a small vessel such as a tomato can or a small lard pail to the mouth. To do this stretch a wire tightly across the top of the can and to the middle of it attach a two-inch wire hook which is to be hooked into the mouth of the bird, allowing the pail to be thus suspended below the head.

Proper Lubrication

For Steam Traction Engines and Steam Plants

Capitol Cylinder Oil

Delivers more power, and makes the engine run better and longer with less wear and tear, because its friction-reducing properties are exactly fitted to the requirements of steam traction engines and steam plants.

Traction Engines, Wagons, Etc.

Mica Axle Grease

makes the wheel as nearly frictionless as possible and reduces the wear on axle and box. It ends axle troubles, saves energy in the horse, and when used on axles of traction engines economizes fuel and power.

Plows, Harrows, Drills

Granite Harvester Oil

insures better work from the new machine and lengthens the life of the old. Wherever bearings are loose or boxes worn it takes up the play and acts like a cushion. Changes of weather do not affect it.

Gasolene and Kerosene Engines

Standard Gas Engine Oil

is the only oil you need. It provides perfect lubrication under high temperatures without appreciable carbon deposits on rings or cylinders, and is equally good for the external bearings.

Every dealer everywhere. If not at yours, write for descriptive circulars to

This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

Jacassa's Journal.

By Mary W. Janvrin.

(Continued from last issue.)

What need to enlarge here? Reader—ah, there comes in "the smell of the shop" again—if you be a woman who has survived the age when every school-girl fancy looms up a mirage—la grande passion—you must have recorded on your brain-tablet similar experiences of your own; and, if you have not, please take my word—Jacassa Selina Bowen, spinster's—for it, that you must be "the exception to the rule," the "one out of the hundred" who have escaped them. I smile now when I think how, as time passed, I loved the author of that little pink, scented note, for I did love him with all the strength of a first sentiment. I suppose it was because of the intensity of my nature. I never do anything by halves; I either love or dislike strongly, unless by chance I sometimes get into that negative state, indifference. But I will record what a devotion I cherished for Montague Livingstone Wentworth, and how, after our correspondence progressed till three score or more of notes had passed between us, and the congenial Elsie Amantha had accompanied me home, and the poet-brother came down to pass a leisure week with his divinity at Aunt Selina's, one day, in the little arbor of Aunt Selina's "back garden," he got down on his knees, and, with his hand on the right side of his white Warseilles vest, vowed eternal fealty to "his peerless, genius-dowried Jacassa.'-

Well, Elsie went back to school, to send me little sisterly notes weekly; I remained with dear old Aunt Selina, who was getting feeble, and "the twin of my soul," who had, meantime, weaned himself from his Alma Mater, though professing his intention some time to write a book of poems "that would startle the world," returned to his native town, content meanwhile to step into his father's shoes and country practice as a more sure foothold in this matter-of-fact world than an uncertain ride on Pegasus's slippery back, varying the employment of mixing pills by inditing sonnets "To Jacassa's Eyebrow!" and letters teeming with protestations of never-dying affection and anticipations of that time "in the bliss-fraught future" which "should bring him happiness and Jacassa."

And this was why—because of the jockey-club scented notes, and the flattery, and the protestations, and sort of shy, silent bliss of reveries and dreams—because of the lock of oiled hair I kept in my writing-desk, and the ring, deviced by two hearts transfixed by one arrow, I wore on the "engagement finger" of my left hand—because of that very natural feeling, common to all hearts, which makes us all want somebody too love and to love us, till sometimes the glamor so blinds our eyes that we mistake the dross for the fine gold—because of all this, for one twelvemonth of my life I walked in a blissful dream along a path of roses.

But the awakening came. The roses turned to commonest flowers—primroses or "old maid's pinks," at that! The day came when—but the tears attest my jesting mood as I write now, and I am saddened, for with that sorrow began the first real experiences of my life—the day came when dear old Aunt Selina died. I loved her; I had brightened some years of her quiet, lonely life; and of late I had strengthened the feeble, groping steps which, day by day—though I did not know it then—were drawing nearer heaven. I felt a strange, sad loneliness when they pressed the sod over her coffin in the little village graveyard. Were my feelings prophetic? Eighteen, and kinless! But when a letter came from Montague, expressive of love and sympathy, I could but strive to banish my sadness, and though tenderly cherishing my kind old aunt's memory, imagine that the world held some brightness after all.

After that, there were strange revelations. Everybody at Eastlake thought Aunt Selina in "comfortable" circumstances; and though I had known that the keen-eyed, ferret-nosed lawyer, Esquire Lynx, had "let" my aunt some moneys, which she had expended in repairs on the place, giving notes for the same, yet from my soul I could not believe but those were fraudulent ones he brought in against the estate at the executors' settlement, covering, as they did, nearly the whole property. Yet there was Aunt Selina's signature, in her cramped, old-fashioned hand. Surmises, if indulged by others, were withheld from me; so, when affairs were settled, it was found that Esquire Lynx's claims covered the whole home-place, and the bequest of 'Selina Bowen, spinster," of her whole property to "her beloved niece, Jacassa Selina Bowen," resolved into my receiving but the paltry sum of a few hundred dollars, as residue of the sale of said "property," "when outstanding debts were paid."

To say that I was surprised at this state of affairs and my sense of utter dependence would hardly express my feelings; I was confused, blinded, not knowing whither to turn. From having never known a want, from being the petted child of Aunt Selina's adoption, who, certainly, if in the straitened circumstances the settlement of her estate showed, was never parsimonious towards me in the matter of money—from this to being thrown, as it were, on myself for a time completely unnerved me. It was weeks before I could fully comprehend my position. Meantime, as the executors' sale had taken place, and the homestead had been bid off at public auction, I had gone to board in the family of the village minister, a worthy man, whose wife had been a firm friend of Aunt Selina's. The venerable man only sighed and shook his head, when the place was sold to the highest bidder; but good Mrs. Dean said, in her cheery, comforting way- "Never mind, my dear, don't cry. It won't be long before you'll have a house and home of your own, and what is better, somebody to love you, if all we hear of that fine young gentleman who used to come to see you is true. So keep up a good heart, Jacassa! Trials are sent us by One who 'doeth all things well.' " I did not betray my feelings in the kind-hearted woman's presence, but when alone I could not restrain the heart-sick tears, for I had received no letter from Montague for a long time. Had he gone, too, with the rest—Aunt Selina, home and fortune? But, afterwards, these salt tears left me calmer. There came a mood of searching thought; something of the old spirit that made me, in childhood, seek out on the map for the spot where my father's dead body went down into the deep, sent my mental vision searching the great unknown ocean of the future to lay my finger on the spot where corpse of a head love should be buried. Was my gaze prophetic then? I think so; for, when days and weeks went by, bringing me no word of affection, no visit from one who, in the past, had asked permission to guide and share my future—when the "congenial" Elsie (who, in the days of my reputed heiress-ship, has scarce allowed a week to pass without some dainty note, commencing "pet" or "darling," found its way to Eastlake) also placed the antipodes of silence between us—then I felt a fine scorn rise up in my heart against these summer friends of fortune, who "stood afar off" when the rough hand of adversity swept over my head. So, one day, with the stregth that surprised myself, I enveloped the pink, scented love-notes, the ambrosial lock of hair, the deviced ring, and returned them all to Montague Livingstone Wentworth. I hope I gave him no more pain in the receiving than it did me in the sending. After that, I settled down for a season into a quiet sort of life. I suppose my heart wasn't dead, only benumbed, for I felt its presence yet in the gratitude I had towards kind Mr. and Mrs. Dean, who, when I told them what I had done, said: "Never think of him again, dear he is not worthy of you. You are our child now." But I think such an experience as I underwent in that time—the suddenly waking from the love-life to find one's self walking henceforth alone, bearing the memory of "not a broken heart, but a broken dream"—tends to make one distrustful, reserved, old before their time, I know it was so with me. I felt little interest in anything or any one outside the home of my kind friends; I shunned society, and, when Frank Dean began to solicit my company to the village lectures, and to manifest a growing sentiment warmer than friendship, I knew that the refusal I felt compelled to give him came from a heart which would not soon again listen to man's love. And then my pride and natural independence of character took alarm; I must not stay in that home to pain these good people by refusing their son's affection; I must go away at once—but whither? I began to cast about for some means of support, for I wished to leave intact the few hundreds, my all, which good Mr. Dean had placed in trust for me. Could I teach? I thought strongly of this plan at first; then another idea occurred. I should have written that, in the year that intervened between my leaving school and Aunt Selina-s death, I had followed my penchant for literary pursuits by the writing and sending some tales and poems to popular periodicals, for which the honor of "seeing my name in print" had been considered ample compensation; and now, bethinking of the many who follow the pen for a livelihood, I enclosed to a publisher my first aeticle for which I asked an equivalent in money. It was returned to me. "It possessed considerable merit, but, owing to the press of matter, obliged to decline. Very sorry not to be able to use," etc. etc. So ran the accompanying note from the publisher. I was disappointed, but not crushed. I do not think I am egotistical by nature but I knew the article was not devoid of merit, and I re-enveloped it to another publisher of whom I had herad favorably as an encourager of young authors. I waited days, poised between hope and fear. If Mr. G—— decided against me, I should grow despairing. But he did not; he remitted me a liberal price for my manuscript; he also sent a kind, encouraging letter— "he would be pleased to hear from me often in the future." I read that letter with tears in my eyes. I felt that my path was marked out for me; literature should be my profession and the means of my livelihood. Another piece of good fortune came. The editor of a ladies' magazine published in a metropolitan city for which I had often contributed during that year of leisure, addressed me, stating that he had need of an assistant lady editor. "Pleased with my sprightly, piquant style, could I be engaged to edit a certain department and contribute a certain amount at a stipulated price?" This, in no wise conflicting with my desire to contribute to Mr. GH's publication, as it left my evenings at my disposal, I hailed as a perfect God-send. I dispatched an affirmative answer; I would be in the city by a given date. Now, indeed, I was comparatively independentf I bade my kind friends goodbye I returned the honest shake of Frank Dean's hand, and promised to remember him with sisterly affection; I went to the scene of my labors.

That was six years ago. I have found friends—some few valued ones, foremost among whom are the kind editor and his gentle lady wife; but I do not go much into society. I write constantly; not so much from the love of the calling, or its reward—though there is rare joy in meeting face to face your own brain-children coming out from their birth-realm, Fairy-land; rare fasination in weaving now a sunny, now a sombre tissue, warp and woof at Imagination's loom!—not so much for these, as to banish, in the busy present, memories of the clouded past. And there is satisfaction in being constantly employed. No idle hours of lady-like ennui, no wearisome moments hanging on my hands! I thank God that He gave me this intense brain, this working nature!

Sometimes there comes visions of another life—a blessed home-life—where some strong arm holds me, and stems back the heavy tide of circumstances that press hard against me; where some strong, true heart shelters me and will not let the storm beat on my naked head. I hear a deep-toned voice say, tenderly, "My own, my wife!" I feel the clasping arms and dewy lips of little children climbing on my knees; I see a home made beautiful by all the garnitures which refinement can gather around me; but that mood is resolutely crushed back, and I am again alone, writing, writing, in my little boarding-house room, with the saddened heart and weary brain—alone, alone!

And yet, why sigh as I write these words? I should be content; my lot is far happier than many—the wretched, the sin-stricken. I do not envy the finest pallid lady to whom satins and velvets, and liveried equipages cannot bring freshness and happiness for the world-weary heart throbbing listlessly under her silken bodice. I am young and healthy, and I am happy. The long autumns and winters in the close city are more compensated by these country sojournings, upon which I enter in the spring-time. I was at Eastlake, last year; the Deans were glad to have me there. Frank met me with kindly heart and hand, and introduced me, with a conscious pride, to his wife and the toddling Frank at her knee. But I do not think it is good to stop always in one place, so this season brought me to quiet, country, yet sea-side, Ryefield. I

Was All Run Down.

Weighed 125 Lbs. Now Weighs 185.

Mrs. M. McGann, Debec Junction, N.B., rites:—"I wish to tell you what Mil-urn's Heart and Nerve Pills have done or me. Three years ago I was so run own I could not do my own work. I ent to a doctor, and he told me I had eart trouble and that my nerves were all nstrung. I took his medicine, as he rdered me to do, but it did me no good. then started to take Milburn's Heart nd Nerve Pills, and had only taken one ox before I started to feel better, so I ontinued their use until I had taken everal boxes, and I am now strong and ell, and able to do my own work When commenced taking your pills I weighed 25 pounds, and now weigh 185 and have iven birth to a lovely young daughter, hich was a happy thing in the family. When I commenced taking Milburn's eart and Nerve Pills, I could not go pstairs without resting before I got to ie top. I can now go up without any ouble."

The price of Milburn's Heart and Nerve ills is 50 cents per box, or 3 boxes for 1.25 at all dealers or mailed direct on eceipt of price by The T. Milburn Co., imited, Toronto, Ont.

9 Water Street,

St. John, N. B.

am quite at home here, with good Mrs. Hull and the kind-hearted farmer. I am glad there is little so-called "society" here. There are two or three hotels down at the shore, but I have no friends there; and I am glad, for they might think it necessary to draw out the literary lady from her self-imposed chrysalis state, and I would not like to be lionized, even in a small way.

By the way, I have omitted to write that I read, a year or two since, the marriage of Montague Livingstone Wentworth. I liked to have forgotten it. His bride's cognomen was Nancy Maria Hopvins. I remember her—she was at the Seminary—the daughter of a wealthy retired tallow-chandler. The saucy younger scholars used to speak of her as "gawky." She had red hair and a nez retrousse, and had a habit of putting her finger in her mouth when she missed her recitation. I wonder if Montague Livingstone Wentworth dowried her with the lock of Macassar-oiled hair and the deviced ring?—I am doubtful concerning the poetical love-notes, for I remember that, at "par's request," "Nancy Mariar" was excused from "composition" at the Seminary—I suppose he did—as he did also with himself—for Nancy Maria's father is dead, and she inherits fifty thousand dollars won in the tallow business.

July 25th, 10 o'clock, p. m.

"'Lisha has come!"

Mrs. Hull came into my chamber this morning, her face aglow with pleasure. If I had been writing a story, and desired to describe her broad, beaming, motherly face as the personification of pleased surprise, I could have filled a paragraph with such description. But I was not thus engaged; instead, I was roused by her voice from the doze into which I had fallen in the cool cane rocker I had drawn up at the window—where the hot sunbeams were tempered among the flickering shadows of the great elm branches—to sit and think, or enjoy a dip into the pages of Mrs. Browning, so I only replied—

"Has? And how pleased you look, my dear Mrs. Hull!"

"And I am pleased—jest as pleased as I can be!" she replied, sitting down a moment near the window, and wiping her perspiring forehead. "And to think that he should 'a up and come home without sendin' a letter, so't I could 'a got fixed up for him! It's jest his way, though. 'Don't want any fixin's on my account, aunty,' he always says. And the beater was, I never heard the stage stop, nor nothin'. You see, Miss Jacassy, I was in the back buttery, whippin' up eggs for my custards, and what should I hear but a man's step on the sittin'-room floor and along through the kitchen, till I looked up and see 'Lisha standin' in the buttery door, and he a-laughin', and sayin' 'Good-mornin' Aunt Sarah!' and a-takin' the egg-dish right out of my hand to kiss me! I thought I should 'a fainted! I sot right down and cried, it come so sudden-like. But tears didn't last long." And her beaming countenance vertified her assertion. "I jest made him go right up to his room—I allers call the west chamber 'Lisha's room'—to get the dust off; and I come in to see if, bimeby, you wouldn't come down stairs to talk with him till father comes, while I get dinner on the table. 'Lisha'll enjoy your company, and your books and po'try; and I'm glad he's come, for 'twon't be so lonely for you now. You'll come down, jest to obleege me, won't you, Miss Jacassy?"

A sudden whim seized me. "Certainly," I answered; "but, 'just to oblige me,'" I added, detaining her, "don't tell Mr. Meredith anything about my being a writer. I have enough of that in the city; here, let me escape it. Now, promise me you won't speak of it, you nor you husband either, dear Mrs. Hull."

She laughed at my earnestness. "La, child, as if you need to go to bein' ashamed of any of them beautiful stories you make up! But sart'inly, I'll do any way to please you. You'll come right down? But,

NEW SCALE WILLIAMS

The Peerless Sembrich

—who received $60,000. a year in New York alone—who was the "star" of all the stars of the Metropolitan Grand Opera Co.—and who has just retired at the pinnacle of her artistic career—selected THE NEW SCALE WILLIAMS PIANO for her Canadian tour.

Madame Sembrich, of course, had her choice of the world's finest instruments. The fact that her preference was the NEW SCALE WILLIAMS shows the esteem in which this marvellous piano is held by the premier artists.

The beautiful tone — which blends so exquisitely with the singing voice—is equally delightful in the home as well as on the concert stage.

TORONTO, Can., Nov. 4, 1909.

"I wish to thank you for the New Scale Williams Concert Grand Pianos which you are furnishing for my concerts in Canada.

"It gives me pleasure to tell you that I find the tone beautiful and of splendid power and carrying quality".

Sincerely yours,

MARCELLA SEMBRICH.

The New Scale Williams is made both in the Grand and Upright styles — in many superb designs.

Our catalogue shows them. Write for a copy.

PURIFIED HIS BLOOD

Dr. Morse's Indian Root Pills Healed Mr. Wilson's Sores

When the sewers of the body—bowels, kidneys and skin ducts—get clogged up, the blood quickly becomes impure and frequently sores break out over the body. The way to heal them, as Mr. Richard Wilson, who lives near London, Ont., found, is to purify the blood. He writes:

"For some time I had been in a low, depressed condition. My appetite left me and I soon began to suffer from indigestion. Quite a number of small sores and blotches formed all over my skin. I tried medicine for the blood and used many kinds of ointments, but without satisfactory results. What was wanted was a thorough cleansing of the blood, and I looked about in vain for some medicine that would accomplish this.

At last Dr. Morse's Indian Root Pills were brought to my notice, and they are one of the most wonderful medicines I have ever known. My blood was purified in a very short time, sores healed up, my indigestion vanished. They always have a place in my home and are looked upon as the family remedy."

Dr. Morse's Indian Root Pills cleanse the system thoroughly. Sold by all dealers at 25c a box. 6

dear sakes, them custards won't get made, if I stand a-loiterin' !"

In passing out, Mrs. Hull left my chamber door slightly ajar; and presently, while from the parlor below came the sound of unclosing shutters and raised windows, I heard the opening of the "west chamber" door across the staircase entry from mine, the sound of slippered feet through the entry and down the stairs, then a manly, pleasant-toned voice saying, "Aunt Sarah, why will you insist upon making a stranger of me and putting me into that close parlor?" Then, from the sitting-room, the same voice said: "Aha! what have we here? Wild flowers, fancy work, and a straw hat! You surely have a lady visitor in the house, Aunt Sarah."

(Continued.)

The Cheaper Cut of Meat.

The wide-spread agitation in regard to prices of food, and especially of meat, which has existed during the last few months, should lead to reforms in many directions. There are so many sides to the matter of food economy that it is small wonder if some important points are lost sight of in the rush of everyday living. For instance, the market price is not the final price of the food. The amount of waste that is paid for before meat is delivered to the cook increases its cost and there is an appalling waste in the trimmings and bones of the more expensive cuts of meat. This is not alone a question of loss of weight, but of nutriment, too. There is a choice in so simple a matter as buying stew meats, although one does not expect waste in cheaper cuts. A bit of fat does not harm, but pieces of meat containing much white skin are largely waste and this means something, even at 8 cents a lb.

The question of how much is thrown away in the kitchen also regulates the final cost. If food is attractively cooked it will be eaten without waste. The size of the portions or the frequency with which certain foods are served are also factors in the final cost. As a rule, people eat more than they need. An expensive nutritive food can be furnished in proper amount for a moderate sum, provided, the palate is satisfied with a good soup for instance, which is nicely flavored and made from the bones and scraps. The soup has no nutritive value but satisfies the appetite in a degree and prevents over-eating.

Aside from these questions is the one of actual first cost of various cuts of meat. Pound for pound, the cheaper cuts contain more nutriment than the dearer ones. By skilful cooking they can be made as acceptable to the palate. Generally speaking, we like the taste of meat that is browned by roasting or frying better than boiled or stewed meat. It is possible to prepare the cheaper cuts with this browned taste.

A roast quite good enough for any table can be prepared from what is known as the "plate piece.'. It is a strip cut from the end of the ribs and contains their cartilaginous ends with a small amount of fat. This piece may be boiled until almost done and then put into a pan for roasting. Sprinkle with salt and pepper, dredge with flour and pour some of the liquid used in boiling into the pan. Baste carefully and brown nicely. Pare some white potatoes and put into the pan with the meat. They will brown nicely. If any of the meat is left, it can be cut in thin slices when cold and served with horse radish or other sauce.

Another cheap cut is the flank steak. The steak has absolutely no waste and in cold weather can be

As handsome as the best iron fence at less than the cost of cheap wood

Here's a neat, strong, durable fence that will add to the appearance of the handsomest city lawn and is cheap enough, close enough and strong enough for the farm. The

Feel Young Forever.

Let Me Put Vitality Into Your Blood, Nerves and Body. Follow Me to Health and Manhood. I Can Show You What Others Have Done to Change Debility, Weakness and Despondency Into Health, Strength, Vigor.

Vitality is the measure of the man in this day of big deeds and monster achievement. He who has great vital strength cannot grow old. Years count for nothing if you have the vitality in your blood and nerves. My Health Belt with suspensory attachment is the FOUNTAIN OF PERPETUAL YOUTH. It pours quantities of electro-vital force into your weakened system. It works quietly, mildly, continually hour after hour while you are sleeping. It is your opportunity as it has been the opportunity of tens of thousands before you; it supplies you with that vitality upon which health and courage depend. It is a power and strength giver of the highest order. No drugs, nothing to take internally, no dieting, no hardships of any kind. Simply use the Health Belt nights until you are restored to vigor. It never ceases until you have as much courage and self-reliance as the biggest, fullest blooded man you know. Your eyes will have the sparkle of full health, you will have the vigor of a strong, healthy man. Henry Eggman, Norwich, Ont., writes: "Thanks to the use of your Health Belt I am young again. It restored me after all else failed. Use my testimonial as you see fit." This is but one of thousands. Get the free books and read of others.

Special rheumatism attachments to my Health Belt carry the Electro-Vilality to any part of the body, the neck, back, arms, legs, feet. It finds and drives away all pains and aches; it has often completely cured weak back in one night so that it never returned again. It is a wonder remedy for chronic ailments of the nerves, blood and muscles.

FREE UNTIL CURED.

Call or write to me and I will at once arrange to let you have the Belt on trial, not to be paid for until cured. No deposit or advance payment. Send it back if it doesn't do the work. Liberal discount for cash if you prefer to deal that way.

These Books Sent Free

Let me send you these Books. They contain much valuable Health information, are fully illustrated, describe my Health Belt. Fill in coupon or send your name and address on a postal card, or if possible call at office and see Belt. Office hours: 9 to 6; Saturdays until 9 p. m.

DR. M. F. SANDEN CO.
140 Yonge St., Toronto, Ont.
Dear Sirs—Please forward me your book, as advertised.

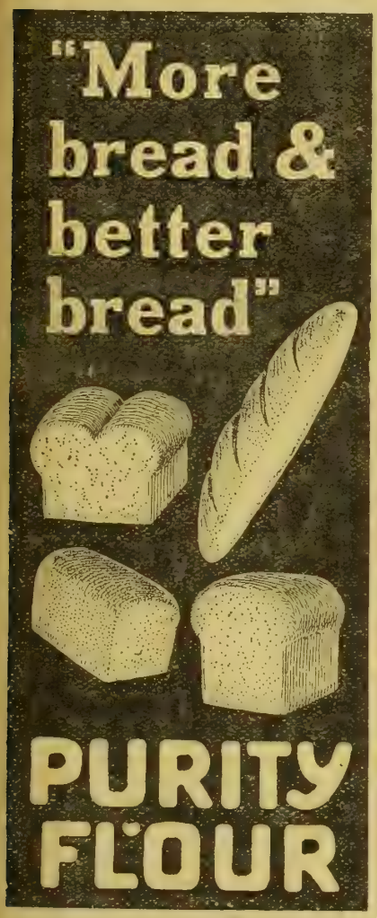
NAME .....

ADDRESS .....

Consumption Book FREE

This valuable medical book tells in plain, simple language how Consumption can be cured in your own home. If you know of any one suffering from Consumption, Catarrh, Bronchitis, Asthma or any throat or lung trouble, or are yourself afflicted, this book will help you to a cure. Even if you are in the advanced stage of the disease and feel there is no hope, this book will show you how others have cured themselves after all remedies they had tried failed, and they believed their case hopeless.

Write at once to the Yonkerman Consumption Remedy Co., 1574 Rose Street, Kalamazoo, Mich., and they will send you from their Canadian Depot the book and a generous supply of the New Treatment, absolutely free, for they want every sufferer to have this wonderful cure before it is too late. Don't wait — write today. It may mean the saving of your life.



BETTER THAN SPANKING.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

MUMFORD BROS.

kept a week without harm. The thick end can be baked. Working from the cut end of the thick portion split the steak in such a way as to make a pocket, keeping the end and sides uncut. Fill this pocket with a good dressing. Put into a pan, season with salt, pepper, dredge with flour and drop a bit of beef drippings here and there. Baste frequently and brown nicely. Any part of this that is left can be cut in neat pieces and used as a stew with a nice brown gravy and a few carrots, an onion and the flavoring used for stews. A few pieces cut from the thin end of the steak can be put in without browning or after being browned. If preferred the thin end can be cut into strips as wide as the steak is thick. Put into the frying pan. When almost done take from the pan, season with salt and pepper, dredge with flour and return to the pan in which the drippings have been heated. Finish cooking. Make a nice brown gravy to serve with this.

Another way of serving this same cut is as a stew. Brown the slices as before an when almost done roll each slice around mixed vegetables which have been cut into strips and partly cooked in salted water. Carrots, celery and onions are a good combination.

The cuts referred to are tender, but even so, they should have slow cooking. After the surface is seared the heat should be reduced in all meat cooking. It is absolutely impossible to cook any of the cheaper cuts and have them good, if there is a fierce fire. On the other hand, it is possible to have them delicious if cooked slowly.

The neck and round are two other cuts furnishing much nutriment, there is no waste and they cost but little. Stews are usually made of the poorer cuts of meat, and hamburger steak is another familiar form of serving.

A round beef is good spiced. Rub the meat first with sugar and let stand three to twelve hours according to the size. Then rub with a mixture of all seasonings used for meat, including the various spices and a bit of saltpetre. Allow to stand as before and then rub well several days. Soak for a short time in cold water then simmer slowly till tender. Put in the cooking water the usual onion, carrot, parsley, etc.

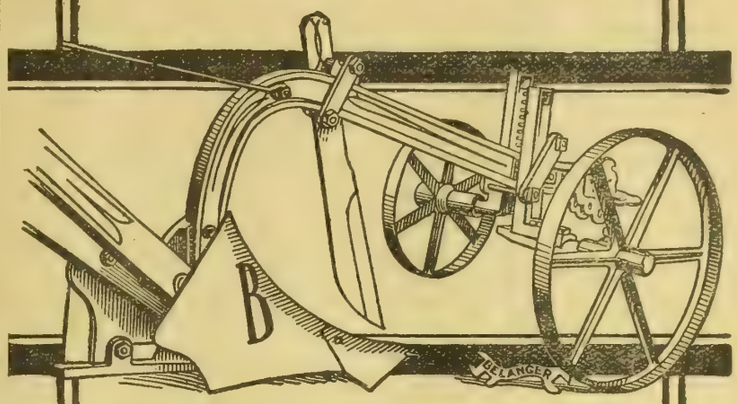
At certain seasons of the year veal is cheap. Cutlets are most indigestible as usually prepared. Trim and season and put into a pan containing quite a good deal of fat. Cook till almost done, then dredge with flour or dip in egg and crumbs and finish cooking.—Farm and Dairy.

Growing Nasturtiums.

Of nasturiums there are dwarf and climbing varieties to suit all situations, with flowers practically alike. Any ordinary well-drained soil will support them perfectly, even though it is decidedly thin. In fact, they blossom better in such earth than in very rich, for in the latter they run to leaf and are apt to rot off in wet weather, in their own dense shade, especially if at all crowded.

Sow as early as the ground is ready. The dwarf or Tom Thumb division will be in bloom in two months, insects will leave them aloneWaphids colonize unpleasantly on the climbers sometimes—and they will still be blossoming when frost comes if picked freely. This is true of most annuals in fact; liberal picking induces generous flowering, for they go on, industriously bent on producing seed, until allowed to do so.—Grace Tabor in Woman's Home Companion.

YOU DON'T NEED A SULKY PLOW—GET THIS TRUCK.



THIS truck under the beam makes an ordinary plow as solid as a sulky—takes the strain off the plowman's arms—makes it almost unnecessary to hold the handles—keeps the plow working at an even depth—makes the draught easier and more regular on the horses—makes it possible for a boy to plow as well as a man could. Anyone can put this truck on ANY plow in 5 minutes—you don't need to have one of our celebrated "B" plows to work it. The large 18-inch wheel runs in the furrow, regulating the furrow thickness and width; the small 12-inch wheel supports the plow when the plowing is too deep and the plow has a tendency to overthrow.

Remember, $5.00 will put this truck on YOUR plow—isn't that cheaper than a sulky? What's more, that price includes free delivery anywhere in Ontario, Quebec or the Maritime Provinces. Write to us for Catalogue No. 000. 5

Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309, Windsor, Ont.

Queen Alexandra.

Editor Maritime Farmer:—

Just now when the nation is mourning a King, perhaps a short article on the late Queen would be interesting to some of our readers.

In old St. George's Chapel, about forty seven years ago, a Danish princess was married to an English prince. Royal etiquette is very exacting, and demanded that the ceremony take place on English soil. Therefore, Princess Alexandra, accompanied by her Royal relatives and guests, crossed the sea to become the wife of Edward, Prince of Wales, who was later to succeed his mother as King.

She was young and beautiful, very gentle and modest, winning at once the hearts of her British subjects. At the time of her coming, Tennyson, poet laureate of England, wrote a famous ode in which he declares, "We each are all Danes, in our welcome of thee," and for nearly half a century this sentiment has remained unchanged and the hearts of her subjects beat as true, to the sea-king's daughter to-day, as when she stood a blushing bride enveloped in bridal veil and orange blossoms.

The late Queen of Denmark was a sensible mother, very domestic in her habits, and made sure that her daughters understood all the details of household management. So this good woman, who has fulfilled the duties of Queen, wife and mother so admirably, came from a home where she had been reared in democratic simplicity. One of her girlish characteristics was the love for simple occupations and amusements, and in her life at Sardingham, was intensely interested in the affairs of the garden and dairy. The model dairy on the estate was her especial pride and her visits to it, more than occasions of formal interest.

Denmark is noted all over the world for its agricultural study and development, so it is only natural that a loyal subject should display such domestic tastes. Danish butter ranks among the best in the world, and Queen Alexandra comes honestly by her pride in farm products. She has done much in her short reign to encourage the tiller of the soil, and many a story is told of her kindly encouragement to the working and poorer classes.

Her presence at the Agricultural Fairs, her interest in the horses, cows, and dairy, was evident that she was an eminently practical woman, as well as a wise Queen.

Together with languages, music, poetry and books, she brought up her children to sew and mend, take care of their clothes and look after their wardrobe. Nor were other duties ignored, cooking and economics in the kitchen were instilled into their minds; also the care of a house and the management of servants, with fairness to all. In the best classes of European society to-day, it is well understood that a girl cannot be brought up in indolent indulgence.

Some years ago, during an exhibition of Colonial products, Queen Alexandra noticed a Canadian cheese marked with the label "The best Cheese in the world." This little phrase slightly pricked the heart still loyal to the fatherland, and as she stood by the mammoth article remarked—"I thought Denmark furnished the best cheese in the world." "No, your Majesty," replied the quick-witted Canadian, "Canada gives the world the best cheese, and Denmark the best Queen." The Queen smiled very benignly and extended her hand to the gallant boy, saying that in the future she would remember not to make such a mistake again.

AUNT BETTY.

Amatite ROOFING

A Frank Statement

HOW many manufacturers of ready roofing will tell you frankly how their goods are made?

Mighty few.

They will talk about "secret formulas," "special waterproofing compounds" etc.—ALL NONSENSE.

They don't tell you what the goods are made of because they don't dare

From the start we have never hesitated to tell the buying public just what Amatite is made of and just what it will do.

How Amatite is Made.

Amatite is made of two layers of COAL TAR PITCH—THE GREATEST WATERPROOFING MATERIAL KNOWN.

Alternating with these two layers of pitch are two layers of coal-tar-saturated WOOL FELT to give it tensile strength

On top of these four layers is a REAL MINERAL SURFACE—five layers of protection.

The mineral surface is permanent, fireproof, and ABSOLUTELY REQUIRES NO PAINTING.

It Needs no Painting.

Roofings that require PAINTING are a worry and an expense. Every year or two you have to climb up and give them a coating with some special compound sold by the manufacturers, or you are pretty sure to have a leaky roof

Amatite is Making Good

We are constantly receiving letters from customers telling us how satisfied they are with Amatite—how much better it is than the old fashioned roofing.

Year after year, in all weather, Amatite will give perfect service without any painting or attention of any kind

Surely this is the kind of service that wins and keeps customers.

Free Sample.

Before you go to your dealer and buy roofing, we should be very glad to send you a sample, so that you can see for yourself just what we are talking about—what a solid substantial reliable roofing we are offering to the public.

Something Back of it.

Remember, in this connection, that Amatite is made by the LARGEST MANUFACTURERS OF ROOFING MATERIALS in the world and that when you buy this roofing there is something behind it. We stand back of every roll. We know we are offering the best and the most economical ready roofing on the market.

For the sample and booklet address our nearest office

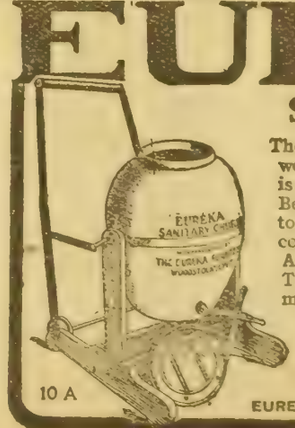
EUREKA
SANITARY CHURN



There's no comparison between the ordinary wooden churn and the "EUREKA". Barrel is stoneware—top is clear glass.
Besides being absolutely sanitary, the glass top enables you to see how the churning is coming along without opening the churn.
Also made with Aluminum top.
The "EUREKA" is the easiest churn on the market to operate. By tilting back the frame until the weight rests on the wheels, the churn can be quickly and easily moved—while the barrel remain upright.
If your dealer does not handle the "EUREKA," do not take a substitute but write us for catalogue.

LONG STANDING SCIATICA

Completely Cured by One Box of Father Morriscy's No. 7 Tablets.

Sciatica is hard enough to endure, and harder still to cure, in many cases, with ordinary remedies. Caused, like rheumatism, by impurities in the blood, which in this case set up an irritation of the sciatic nerve, it is so difficult to get at with external applications that many sufferers try in vain to get relief.

Mr. Charles McEachern, of Summerville, P.E.I., was in just that position until he started to take Father Morriscy's "No. 7." He writes:

"After trying several doctors and spending large sums of money without avail, I was completely cured of Sciatica of long standing after using one package of your Medicine (No. 7 for Rheumatism.)"

No matter how long you have suffered from Sciatica or Rheumatism of joints or muscles—no matter how much medicine or liniment you have used without result—try Father Morriscy's No. 7 before you give up. It has restored health to many who were almost hopeless.

50c. a box at your dealer's or from Father Morriscy Medicine Co., Ltd., Chatham, N.B. 85

A Farmer's Wife

"A farmer's wife!" Can anything be finer or more beautiful than the picture these words bring to view? Who can be prettier in a calico dress doing her daily work or looking over matters in general during the long winter evenings when the profits of the previous season are figured up and estimates drawn for the coming summer? Who can be so proud as the possessor of such a helpmate, especially if he realizes her worth? Sure no millionaire with his transitory mate can know anything about the joy of living in an atmosphere of love and practical housekeeping, where the interest of one is the common thought of both, where one takes pleasure of depriving himself of a luxury that the other may have some labor-saving convenience, as can a farmer in his comfortable home with a wife who will stay with him through success and failure until the end of things earthly. No other business in life offers the inducements to "love in a cottage" and a mutual interest as does farming; in no other walk in life may a woman be of so much assistance or hindrance to her husband as on that nearest to nature and all that is good—a farm home. There her brains shine out through the appearance of her home, her children and her husband, especially if he is wise enough to take her advice; many a farmer who has risen to prominence in his native town and State owes it all to his wife's keeping his accounts straight whereby he gained a reputation for square dealing and promptness in meeting his obligations.

In city or town the disposition and character of woman may be hidden like her face in a powder of artificiality, but on a farm she must show as she is—a worker or a drone—sweet-tempered or a scold, for she has much to try her patience and her atmosphere prevades the household, for it is her domain—not given over to hirelings nor left for the summer, but attended to daily and ruled not with a rod but by her own sweet personality. Wadsworth must have had a farmer's wife in mind when he said:

"I saw her upon nearer view,
A spirit, yet a woman too,
A countenance in which did meet
Sweet records, promises as sweet;
A creature not too bright and good
For human nature's daily food—
For transient sorrows, simple wiles
Praise, blame, love, kisses, tears, and smiles,
The reason firm, the temperate will,
Endurance, foresight, strength and skill.
A perfect woman, nobly planned
To warn, to comfort and command.
And yet a spirit still, and bright,
With something of angelic light."

The farm may not possess the perfect woman, but it shows every woman to her best advantage for every farm has in its history, success, happiness, adversity and sorrow, and these together with the richness of nature show every virtue flaw.—One of Her Admirers, in Maine Farmer.

Cement for Iron Pots.

I enclose you an item of a handy cement to mend iron pots and pans, as I have used it myself and found satisfactory.

The cement is as follows: Take two parts of sulphur and one part by weight of fine black lead; put the sulphur in an old iron pan, holding it over the fire until it begins to melt, then add the lead, stir it well until all is mixed and melted, then

The electrically-welded, solid-piece frame gives strength and stiffness to

Peerless Farm and Ornamental Gates

We build Peerless Gates to last a lifetime—handy, convenient and attractive. They remain staunch and rigid through all kinds of rough usage. The frame is made of heavy steel tubing electrically welded into one solid piece. The Peerless Gate, like the Peerless Fence, saves expense because it never needs repairs. We also make poultry, lawn and farm fences of exceptional strength. Write for free book.

Buy Hosiery Made by the Largest Mills on a 2-for-1 Guarantee

We guarantee the following lines of Pen-Angle Hosiery to fit you perfectly, not to shrink or stretch and the dyes to be absolutely fast. We guarantee them to wear longer than any other cashmere or cotton hosiery sold at the same prices. If, after wearing Pen-Angle Guaranteed Hosiery any length of time, you should ever find a pair that fails to fulfill this guarantee in any particular, return the same to us and we will replace them with TWO new pairs free of charge.

That 2 for 1 guarantee—the most liberal given anywhere—is backed up by the largest hosiery mills in Canada. You can depend upon the guarantee being fulfilled to the last letter.

Buying hosiery on this plan you make doubly sure of satisfaction, for if the hosiery does not fulfill the guarantee the makers have to pay a double penalty.

But after you've worn a pair of Pen-Angle Hosiery you'll understand why we give this 2 for 1 guarantee, for you will have discovered your ideal hosiery—form-knitted, seamless, longest-wearing.

The reason for Pen-Angle superiority is due to the exceptional quality of the cashmere and cotton yarns we use. And because we knit them on Penmans' exclusive machines. We have the sole rights to use these machines in Canada.

Seamless Hosiery

These machines form-knit the hosiery to fit the form of the leg, ankle and foot perfectly, without a single seam anywhere to irritate the feet or rip apart.

They reinforce the feet, heels and toes—the places that get the hardest usage—without you ever being aware of any extra thickness.

Don't be content another day with hosiery which has those horrid seams up the leg and across the foot—with hosiery less serviceable—but get Pen-Angle 2 for 1 guaranteed hosiery

For Ladies

No. 1760.—"Lady Fair" Black Cashmere hose. Medium weight. Made of fine, soft cashmere yarns, 2-ply leg. 5-ply foot, heel, toe and high splice, giving them strength where strength is needed. Box of 3 pairs, $1.50; 6 pairs, $3.00.

No. 1020.—Same quality as 1760, but heavier weight. Black only. Box of 3 pairs, $1.50; 6 pairs, $3.00.

No. 1150.—Very fine Cashmere hose. Medium weight. 2-ply leg. 4-ply foot, heel and toe. Black, light and dark tan, leather, champagne, myrtle, pearl gray, oxblood, helio, cardinal. Box of 3 pairs, $1.50; 6 pairs, $3.00.

No. 1720.—Fine quality Cotton hose. Made of 2-ply Egyptian yarn, with 3-ply heels and toes. Black, light and dark tan, champagne, myrtle, pearl gray, oxblood, helio, sky, pink, bisque. Box of 4 pairs, $1.00; 6 pairs, $1.50.

No. 1175.—Mercerized. Same colors as 1720. Box of 3 pairs, $1.00; 6 pairs, $2.00.

For Men

No. 2404.—Medium weight Cashmere half-hose. Made of 2-ply Botany yarn with our special "Everlast" heels and toes, which add to its wearing qualities, while the hosiery still remains soft and comfortable. Black, light and dark tan, leather, champagne, navy, myrtle, pearl gray, slate, oxblood, helio, cadet blue and bisque. Box of 3 pairs, $1.50; 6 pairs, $3.00.

No. 500.—"Black Knight." Winter weight black Cashmere half-hose. 5-ply body, spun from pure Australian wool. 9-ply silk splicing in heels and toes. Soft, comfortable, and a wonder to resist wear. Box of 3 pairs, $1.50; 6 pairs, $3.00.

No. 1090.—Cashmere half-hose. Same quality as 500, but lighter weight. Black only. Box of 3 pairs, $1.00; 6 pairs, $2.00.

No. 330. — "Everlast" Cotton Socks. Medium weight. Made from four-ply long staple combed Egyptian cotton yarn, with six-ply heels and toes. Soft in finish and very comfortable to the feet. A winner. Black, light and dark tan. Put up in boxes. Box of 3 pairs, $1.00; 6 pairs, $2.00.

Instructions

If your dealer cannot supply you, state number, size and color of hosiery desired, and enclose price, and we will fill your order postpaid. If not sure of size of hosiery, send size of shoe worn. Remember, we will fill no order for less than one box and only one size in a box.

Catalog Free

If you want something different than the styles and shades listed, send for handsome free catalog which shows an extensive line in colors. 45

pour it out on an old iron plate or stone. When cool break into small pieces. A sufficient quantity of this compound being placed upon the crack of the iron pot to be mended can be soldered by a hot iron in the same way as a tinsmith solders his sheets. If there is a small hole in it the pot, drive a copper rivet in it and then solder over with cement.

HETHER BELL.

The Summer Care of Furs.

One is often at a loss to know just how to best care for furs during the summer season when moths, etc., are so liable to attack them. I have frequently wondered how the large furriers ensure themselves against loss from insects on the stock that they carry between seasons. Many receipts are advanced for the purpose of protecting furs from moths. While in Toronto recently I decided to find out at least one up-to-date practice in this particular. I was in Dineen's fur store and on enquiry learned that their practice was to store their furs in ordinary tar building paper.

For a fur-lined coat, for instance, strips of paper were cut off the roll and one shoved down each sleeve of the coat. A larger sheet was placed over the main part of the lining, then the whole thing was packed away.

There is no reason why anyone may not store furs in this manner. Tar building paper is very cheap, and there is usually some on hand on the average farm.

House Plant Helps.

Red spider on house plants: Pick off the worst leaves. Lay the plants on their sides and hose or syringe them thoroughly; then take soapy water and a sponge and handwash every leaf and while they are yet wet dust the under sides of the foliage with powdered sulphur.

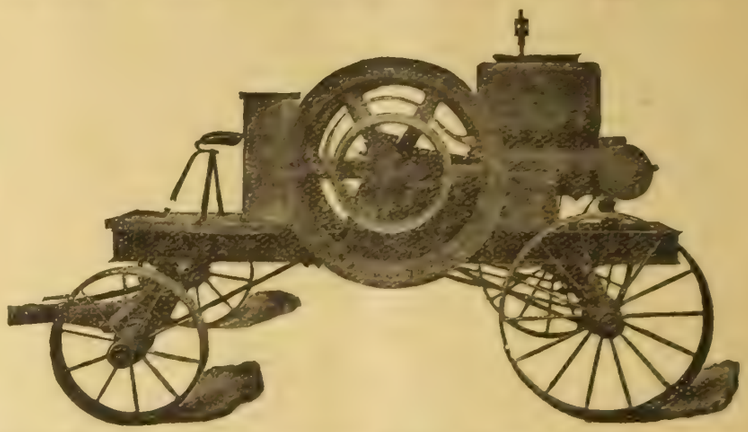
When plants have been in the indoor window-box sufficiently long to fill it with roots, fertilizer must be applied either in the form of bone-meal or rotted manure, or preferably, by the addition of weak liquid manure. This should only be applied when the plants indicate their need by a check in growth. Such a plan should afford satisfaction.

To grow fine calla lilies, put a thick layer of charcoal in the bottom of a box fifteen inches square and fill with leaf mold and a little sand. Plant a calla in each corner, and in the centre sink a six-inch flower-pot with the drainage hole stuffed with moss, and with a layer of charcoal above the moss. Water carefully till growth is well started, then fill the six-inch pot once a day with water. If the lilies drink so quickly that the pot is empty before night, refill. Wash and shower the leaves weekly.

Receipts.

Rice Croquettes.—Take a teacup of hot well-boiled rice and a teaspoon each of sugar and butter, with half that quantity of salt, and to them add one beaten egg and sufficient milk to bring all the consistency of a firm paste after thoroughly beating and mixing. Shape into oval balls and dip in beaten egg followed by a dipping in bread crumbs. Fry in sweet, hot lard, turning with care, and when done to a nice brown put into a heated colander. These are very nice to have a well-plumped rasin or candied cherry pushed into the centre befor frying and served with maple sauce.

THE GILSON
"Goes Like Sixty."
Gas and Gasoline Engine.



All Sizes Stationary and Portable.
Has a World Wide Reputation as
THE STANDARD ENGINE.

THE GILSON ENGINE is the highest development of gas engine construction. It is the result of tireless INVENTIVE INGENUITY, RIPE EXPERIENCE, and a fixed purpose to produce the BEST THAT IS MADE.

THE GILSON ENGINE incorporates the best features of all foreign and domestic engines, and besides possesses distinguishing features not found in others.

THE GILSON ENGINE is noted for Reliability, Power and Durability. It will last indefinitely with ordinary care and be a constant source of satisfaction.

THE GILSON ENGINE is most ATTRACTIVE in APPEARANCE, EASY to OPERATE and VERY ECONOMICAL.

Our reputation for producing the highest grade engines, for fair dealing and liberal, courteous treatment and Low Prices, is one of our most valued assets.

Ask for our large Catalogue; get our prices; compare Engines and Prices and you will decide in favor of the Gilson Engine, because it is the BEST and CHEAPEST as well.

Do not allow a dealer or agent to sell you another make that is "Just as Good" as a "GILSON." Insist on having a "GILSON" and you will never regret it. Your dealer or agent makes more money by selling you an inferior machine, but what he makes, you loose.

Remember we absolutely guarantee every engine we produce.

Scab. Early and Late Blight.

(Continued from page 557.)

with the formalin solution. Avoid planting mangels, beets, turnips, potatoes, etc,, on infected land. A long rotation of hoed crops, grain and grasses is advisable as the turning under of green and other crops tends to produce a condition of the land unfavorable to the disease. Avoid as far as possible the use of fresh manures, ashes and lime, as these produce a condition favorable to the spread of the disease. Burn or feed all parings from scabby potatoes.

EARLY AND LATE BLIGHTS.

For a long time it was generally conceded that practically no infection of blight or disease occurred from the spores of the fungus wintering over in the tubers in some form or other. In fact the general idea has been that practically all the infection was due both to the presence of spores in the soil on certain nearby hot plants, which spores only awaited favorable germination conditions to infect the crop. Working on this theory, growers and experiment station investigators have assumed that repeated sprayings with Bordeaux Mixture would completely controll the disease. This assumption, however, has not in all cases proved true and recent experiments conducted at the Royal Botanical Gardens, Kew, England, indicate that a large amount of potato disease of early and late blight is produced from latent myclelium, that is a spore producing body remaining inactive in the tuber in winter, and which is consequently present in the sets when planted.

Now that the one-time suspicion that tubers carried disease over winter in this fashion has become an established fact, the great importance of preventing disease by treatment before planting is readily understood.

PREVENTATIVE MEASURES.

The presence of this latent myceluim in a potato is easily detected by removing a slice from the heel end, when it will be visable as so many thin, reddish-brown threads or streaks. All such potatoes should be destroyed by burning or feeding to the pigs. As removing a portion from the heel of a potato is more beneficial than injurious, there is no excuse for planting uncut any potatoes we may suspect of infection.

Such potatoes may first be treated with the formalin solution to destroy the scab spores and any blight spores that may be on the skin and then cut as above, and all infected or suspicious looking tubers should not only be discarded but effectually destroyed.

Never leave the old seed tubers in the ground but carefully collect and burn them. On no account plough in a field of potatoes rendered worthless by disease, as by so doiog you will infect the soil for years to come. Gather everything up and burn as completely as possible.

After taking tbe above precautions at planting, keep all the vines of the potato plant coated with Bordeaux mixture and loss from rot will be reduced to a minimum. Do not stop spraying until the veins stop growing there will always be new leaves that may be attacked by the blight spores.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Wharf at Sackville, N. B.," will be received at this office until 4.00 P. M., on Monday, July 4 1910, for the construction of a Wharf at Sackville, Westmorland County. N B

Plnas, specification and form of contract can be seen and forms of tender obtained at this Department, at the offices of E. T. P. Shewen, Esq., District Engineer, St John, N B; Geoffrey Stead, Esq., District Engineer, Chatham, N. B., and on applicatson to the Postmaster at Sackville, N. B.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures, stating their occupations and places of residences. In the case of firms, the actual signature, the nature of the occupation and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, made payable to the order of the Honourable the Minister of Public Works, for two thousand seven hundred dollars ($2,700.00,) which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By Order,
NAPOLEON TESSIER,
Department of Public Works,
Ottawa, June 2, 1910.

Newspapers will not be paid for this advertisement if they insert it without authority from the Department.

FOR SALE.

100,000 apple trees, 75,000 Pears Plums, Cherries. Complete assortment of other stock. Guaranteed first grade and TRUE TO NAME. Agents wanted on vacant territory, selling for fall and spring 1911 delivery.

THOS. W. BOWMAN & SON Co. Ltd.
Ridgeville Ontario,

Pleasant View Farm For Sale.

Farm in best fruit section of Annapolis Valley containing 115 acres land. About 40 acres orchard, 2000 trees mostly apples, but includes pears, plums, etc., 1¼ acres raspberries Good pasture and plenty of wood, fine place for dairying. 3½ miles from Middleton and Wilmot, 1½ mile from church, ½ mile from school, daily mail. 8 room house, barn room for 10 head cattle and horses, barb wire fencing, soil varies from sandy loam to clay loam with clay subsoil. Reason for selling, owner engaged in other business which requires all of his attention. For price and terms apply to the owner.

Feeeing Potatoes to Live Stock.

Owing to unsatisfactory prices received for potatoes, many farmers are feeding them to stock, especially swine. A Vermont farmer in the vicinity of Montpelier is reported as having 1000 bushels in his cellar, and is boiling them at the rate of 25 bushels daily and feeding them to cattle and hogs. In that vicinity potatoes are retailing at 40 cents a bushel, but farmers are receiving only 20 to 30 cents. Some argue that potatoes are worth 30 to 35 cents a bushel for feed, considering the high price of grain. However, it is doubtful if the farmer can get that much value from his tubers, even though they are cooked for the stock.

In this connection it is interesting to note some of the experiments at different agricultural colleges. At the Wisconsin station hogs ate cooked potatoes better than uncocked, and 445 pounds cooked potatoes were equal to 100 pounds corn meal for feeding value. One pound dry matter of corn meal is superior to one pound dry matter of potatoes for making gains with pigs. In France, Girard fed 55 to 66 pounds cooked potatoes per day to fattening steers and 4 1-2 to 6 1-2 pounds to sheep. for milch cows 25 pounds daily per 1000 pounds live weight is the limit. For yearling ewes and wether sheep 25 pounds of potatoes daily to 1000 pounds live weight is advised. Stock should not be watered soon after eating potatoes but preferably about a half hour before eating.

The Vermont station states that butter from cows fed potatoes is inclined to be salvy and keep poorly. It is stated that potatoes at a higher price than 15 cents a bushel is more costly feed than is corn silage. In Michigan potatoes lessened digestibility of other parts of the ration, although the same experiment showed no particular ill effect upon the milk or butter. The Ottawa station in Canada reports that potatoes either raw or cooked were unsatisfactory rations for hogs. Even when I fed with skim milk grain had to be added. It is recommended that the tubers be cooked for hogs and fed with grain.

Relative to feeding raw or cooked, there are varying opinions. The Wisconsin station believes potatoes should be cooked, especially for swine. The Minnesota station found that potatoes were no more digestible when cooked than when fed raw to swine, but that pigs ate more when cooked.

Summer Orchard Meetings.

To give practical demonstrations of pruning, grafting and spraying work the following list of meetings will be held to which everybody interested is invited. The addresses and demonstrations will be given by S. L. Peters, the well-known Queens County fruit-grower, and A. G. Turney, Provincial Horticulturist, in an orchard at or near the places named:

Tuesday, June 21, 9 a. m., St. Leonards, Madawaska Co.

Wednesday, June 22, 9 a. m., New Denmark, Victoria Co.

Thursday, June 23, 1.30 p. m., Upper Woodstock, Carleton Co.

Friday, June 24, 2 p. m., Keswick, York Co.

Saturday, June 25, 10 a. m., Maugerville, Sunbury Co.

Monday, June 27, 2 p. m., Mouth Jemseg, Queens Co.

Tuesday, June 28, 2 p. m., Hampstead, Queens Co.

Wednesday, June 29, 2 p. m., Hampton, Kings Co.

Thursday, June 30, 2 p. m., Salisbury, Westmorland Co.

Friday, July 1, 2 p. m., Dalhousie, Restigouche Co.

Saturday, July 2, 10 a. m., New Brandon, Gloucester Co.

Monday, July 4, 2 p. m., Black River, Northumberland Co.

Tuesday, July 5, 2 p. m., Bass River, Kent Co.

Wednesday, July 6, 2 p. m., St. Marys, Kent Co.

Friday, July 7, 2 p. m., Shediac, Westmorland Co.

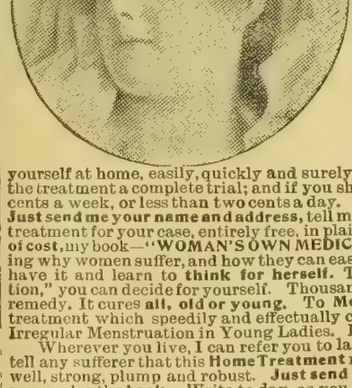
Colt Followiug Mare.

(Continued from page 564.)

times he takes a few swallows from the maternal fount. Taking all these hindrances together, much time is lost. While the colts are very young it is better for them if the mares can be driven to the barn in the middle of each half day so the youngsters can suck, and this ordinarily takes less time than the colts would waste in the field. It is not safe to take the colts to the field and tie them up. When left in this way they can find more ways of tangling themselves up than you would believe possible. Many colts have been chocked to death in this way. A tight box stall with a little oats and hay to nibble is the best place for colts in the day time until they have become accustomed to being separated from their dams. After they have become reconciled to this they can be turned into the pasture when the mares are taken out to work and will soon learn to be on hand at the gate at noon and night, ready for refreshments.

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.



I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, **free** of any charge, my **home treatment** with full instructions to any sufferer from women's ailments. I want to tell **all** women about this cure—**you**, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourself at home without the help of a doctor. Men **cannot** understand women's sufferings. What we women know **from experience**, we know better than any doctor. **I know** that my home treatment is a safe and sure cure for **Leucorrhœa** or **Whitish discharge, Ulceration, Displacement** or **Falling** of the **Womb, Profuse, Scanty** or **Painful Periods, Uterine** or **Ovarian Tumors** or **Growths**, also **pains in the head, back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weakness peculiar to our sex.**

I want to send you a **complete 10 days' treatment entirely free** to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that **it will cost you nothing** to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week, or less than two cents a day. It will not interfere with your work or occupation. **Just send me your name and address**, tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you **free of cost**, my book—"**WOMAN'S OWN MEDICAL ADVISER**" with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it and learn to **think for herself.** Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures **all, old or young.** To **Mothers** of **Daughters**, I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness, and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this **Home Treatment** really **cures** all women's diseases and makes women well, strong, plump and robust. **Just send me your address**, and the free ten days' treatment is yours, also the **book.** Write to-day, as you may not see this offer again. Address:

MRS. M. SUMMERS, Box H 309 - WINDSOR, ONT.

HEADACHE

AND

Burdock Blood Bitters.

The presence of headache nearly always tells us that there is another disease which, although we may not be aware of it, is still exerting its baneful influence, and perhaps awaiting an opportunity to assert itself plainly.

Burdock Blood Bitters has, for years, been curing all kinds of headaches, and if you will only give it a trial we are sure it will do for you what it has done for thousands of others.

Headache and Constipation Cured.

Mrs. John Connors, Burlington, N.S., writes:—"I have been troubled with headache and constipation for a long time. After trying different doctors' medicine a friend asked me to try Burdock Blood Bitters. I find I am completely cured after having taken three bottles. I can safely recommend it to all."

For sale by all dealers.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

Underdrainage in Nova Scotia.

The officials of the Nova Scotia Agricultural College are endeavoring to launch a scheme to encourage the more extensive under drainage of the farms of that province. Many of the best farms are already well underdrained and many other farms do not require an artificial system of drainage, but the vast majority of the arable lands of the province are sadly in need of systematic underdrainage. Climatically Nova Scotia is splendidly adapted to a high type of agriculture and the soils are suited to almost all crops that will grow in any other part of Canada. The one draw back is that, owing to the cold winds which blow in from the Gulf of St. Lawrence to the north in the early spring, seeding is delayed some two or three weeks later than, for example, in the province of Ontario, and while this is partly off-set by the more humid conditions of the summer and a long fall season, yet on wet, heavy lands, it makes the growing season too short for the best development of crops. The need of underdrainage, it will, therefore, appear, is even more urgent than in the inland provinces.

At the 1910 session of the Legislative Assembly in Halifax, an Act entitled "The Tile, Timber and Drainage Act" was passed similar to the like Act in the province of Ontario. According to this Act, Municipalities are empowered to borrow money and to advance it to farmers who purpose under-draining land on a basis of between 7 per cent. and 8 per cent. per annum, which includes interest and sinking fund which will redeem the debt in a period of 20 years. This means that for an expenditure of $8.00 per year for a period of 20 years, farmers can have $100 worth of drainage on their farms. Those who have had even a very little experience will appreciate the percentage return which may be had from this comparatively small investment. For with $100 worth of drainage, it is easily possible to increase the crop producing power of the land on a given farm anywhere from $25.00 to $100.00 or more dollars per year. According to the Act, this interest and sinking fund is to be collected along with the ordinary taxes. The Act is a good one, but we doubt if at present there is sufficient public sentiment to urge the Municipal Councils to move in the matter. It is hoped, however, that as public sentiment grows, this objection will be off-set.

As another means to encourage underdrainage, the College has advertised the fact that they will send men to make drainage surveys of farms it is purposed to under-drain. All that is required of farmers who wish such survey made, is that they pay the travelling expenses and entertain the men while they are engaged in the work.

What is at present, however, proving the most effective means of encouraging under-drainage, is the purchase by the College of a Buckeye Traction Ditcher, which has now been in operation some two weeks and is giving excellent satisfaction. The College is taking contracts to dig drains with this machine at about one-half the cost of doing the same by hand, with the added advantage of the work being accomplished with quick dispatch. The machine is under the management of Mr. F. F. Fuller, Superintendent of Agricultural Societies. During the past two weeks this ditcher has been operating in the vicinity of the College, but in a few days it will move to the Stewiacke Valley, where a number of farmers have given contracts for the draining of their land. For the present year, at least, the price of drainage with this machine is made so low that the College will lose money. But in classic phrase "What is our loss is the country's gain." The main idea in view is to get as much land under-drained as possible during the ensuing summer and thus afford an extensive demonstration of the advantages of the process. Should the College operated machine prove popular, it is hoped that it will pave the way for private enterprise to take hold of the matter. At least, this is what has resulted from a similar policy in connection with the encouragement of draft horse breeding in the province.

The Annual Report of the Secretary for Agriculture for the Province of Nova Scotia, which has been extensively circulated, and of which there are still a few copies left for free distribution, contains a series of educational articles on the various phases of drainage and gives instructions for the laying out of a system, as well as for the various details of digging and grading of drains. All well wishers of agriculture cannot but hope that this campaign issuing from Truro will prove highly successful, for under-drainage, in more senses than one, is one of the most fundamental considerations in the development of a profitable agriculture.

A Prince Edward Island Scene.

Soiling Cows for Dairy Profits.

Editor Maritime Farmer:—

The time of year has rolled around again when we farmers turn our cows out to pasture. I trust the time will soon come when early pasturing will be forgotten, for, as we all know, while the green plants are so tender there is not much nourishment in them, and in consequence, the cows continue travelling all day looking for something that "satisfieth not." Besides the extra amount of labor in travelling around the cow is damaging the young roots of grass to such an extent that it scarcely ever recovers so as to give its full growth again during the following summer. If the grass is not allowed to get to a reasonable height before pasturing it does not draw so large a proportion of its food from the atmosphere and it therefore receives a double set back in growth, first from being tramped down and secondly by loss of foliage. I think grass should be at least eight or nine inches high before cows are turned out to live on it, then it will scarcely ever be eaten off until a sufficient supply of green feed can be cut from oats, peas and vetches sown at different times from early and successive sowings at intervals of ten days until the twenty-fifth of June. A satisfactory mixture would be 25 lbs. of vetches, 25 lbs. of peas and 60 lbs of oats to the acre. I have scarcely ever seen satisfactory resu,ts from sowing later than June 25th, as it is apt to become rusted and be unfit for good feed.

When you see a farmer that sows plenty of green feed he is never complaining of dry summers and short pastures, neither does he complain of his cows drying up or his returns from the cheese and butter factory not being satisfactory. There is no danger of having to much of this green feed, for if there is any more than can be used in summer, it can be cut before it gets too ripe and made into hay. It will grow three or four tons to the acre when cured. When the peas, oats and vetches are used up the corn will be fit to feed and the two being fed together makes better feed than any pasture at that time of year. The corn can be left standing in the field until the last of September, when it can be cut and stood up in stooks until the first of November, when it will be cured enough to be stood up in the barn and fed for another month, which will keep your cows almost to their full milk well into the winter, and thereby greatly increase the profits from dairy cows.

F. GLYDON.

Margate, P. E. I.

Treatment of Scours in Calves

There are many treatments advanced from time to time in the columns of the agricultural press in regard to the treatment of scours in calves. In my experience there is no equal to the formalin treatment, when it comes to dealing with this dreaded malady.

The cause of scours is said to be a germ entering the navel of young calves. Damp quarters, milk from newly freshened cows fed to other than their own calves, milk too cold, etc., are predisposing causes. In any case, the trouble should be investigated and the cause removed if possible.

The formalin treatment, as I apply it, is: One-half ounce (five cents' worth) of formalin diluted with 15½ ounces water (nearly a pint).) A teaspoonful of this solution fed in about a pint of milk, three or four times daily, has always brought about an immediate cure.—G. A. Brethen.

A P. E. I. Indian.

Of Interest to N. B. Fruit Growers

The Provincial Department of Agriculture, through A. G. Turney Horticulturist, is prepared to assist all those who wish advice in regard to planting apple, plum, and cherry trees or small fruits in the spring of 1911 if they will write him at Fredericton, stating particulars in regard to site and soil upon which it is intended to plant, what crops are growing thereon this summer whether the orchard is intended chiefly for home use or for market and stating any special preference for certain varieties of apples, etc.

With a knowledge of these particulars, Mr. Turney will be able to give the enquirer advice based upon his study of conditions and the suitability of varieties to the various parts of the Province. He will also undertake to place and personally select any orders sent to him from the very best stock grown in the Province so long as the supply lasts and after that from reliable Canadian firms elsewhere. By taking this course the purchasers may avoid planting undesirable varieties and loss through misrepresentation and mistaken advice from unreliable agents. It is urged that orders for 1911 be placed as early as possible this year so that the stock may be early selected and only the best trees taken. Later orders will, of course, have to be filled from what is left after selected stock is booked.

Care of Wool on the Farm.

The sheep shearing season is here again and a little thought on the care of the wool will be of profit to all. At a recent outing of the Connecticut sheep breeders' association to the woolen mills of the Stafford worsted company a few points were emphasized which are important to sheep raisers.

The first thing that needs attention in producing the cleaner wool is to see that our feeding racks are of such construction that a minimum amount of hayseed and chaf will work its way into the fleece while feeding, for if it once gets into the the wool it is there to stay.

The second is to see that the sheep have a clean bed so that the wool will not become unnecessarily soiled.

The third is to have a clean floor for shearing. Never shear a sheep on a barn floor covered with dirt and hayseed. First sweep it clean and then keep it clean. When you are ready to take up the fleece be careful that nothing but wool goes into the bundle, and that all wet and dirty locks are removed and put into a separate package.

The last point is to tie each individual fleece into a neat, compact bundle with the proper kind of twine. Neve

Corrugated Iron

Gananized, Rust-Proof Made from very finest sheets, absolutely free from defects.

Each sheet is pressed, not rolled, corrugations therefore fit accurately without waste. Any desired size or gauge, straight or curved.

(47)

use sisal or binder twine, as the fibres are sure to break off more or less and stick to the wool, and as they will not take the dye the same as the wool they must be either picked out by hand or the entire fleece goes into a cheaper grade, and in either case the producer is the loser. Instead of this use regular wool twine, which will take the dye, and so is not objected to by the buyers. Use two or three strands around each bundle each way and tie them tight as the buyers would rather pay for a little extra twine than to have the fleece come apart.

If every producer of wool in the Maritime Provinces will endeavor to have his product as clean and attractive as possible we shall soon find that we are getting better prices and sheep raising will become still more profitable.

Ragwort Eradication.

Editor Maritime Farmer:—

"What course has the East Pictou County Council of Women taken to try and eradicate the obnoxious weed called ragwort from their County", you ask—having heard of its endeavors in that direction at the Farmers' Parliament held in New Glasgow in January last.

The answer is in this wise. Realizing the curse that this rank weed is to the farming interests in the County of Pictou, which in many of its sections is ablaze in the late summer and autumn with its bright yellow bloom, and knowing that it has been officially credited as being the cause of the cattle disease in the said county, the Woman's Council, which is patriotic in its purpose, decided to enter into a crusade of extermination. The school children were enlisted into the service. Through the local press and visitations of the schools the scheme was made known. Prizes were offered, as far as the money at the disposal of the Council would admit, to those collecting and burning the largest number of stalks—a reliable person in each locality, generally a school trustee, certified to the number and the burning. Prizes were also given to the seven highest schools competing. This plan was adopted for the first year. Some thirty schools competed. The largest individual collector of stalks numbered 179,000.

Finding that this plan resulted in disappointment to the children who, although working faithfully, fell below the prize mark, a change was made for the two following years in the manner of the rewards. Five cents per thousand was offered, thus securing payment to every one who cared to enter into the contest, while the ten highest were awarded special prizes according to their rank in numbers.

Several sections of the County carried on the work faithfully and reported a decrease of the weed as the result, but the apathy of the farmers was a serious obstacle to the work. Some were averse to the children handling the weed; others thought it too hard work; some thought the propaganda a useless one, and some were satisfied with the keeping of their own farms clean and were not concerned with the highways and vacant lands where the greatest quantities were to be found.

To make such a scheme a success teachers and parents must co-operate. The first prize boy of the first year has kept up his interest all through and has added much to the extermination of this enemy to good farming in his native land—but single handed it is a most discouraging game.

CAROLINA CARMICHAEL.
New Glasgow, N. S.

FLORICULTURE.

All enquiries in this department will be answered by H. E. Goold, Florist, Sussex, N. B.

M. A. H. writes: How shall I plant my Gladiolus bulbs and how deep?

Gladiolus bulbs should be planted the last of May. The best method of planting them so as to enable them to stand the dry weather, is to make trenches four or six inches deep and cover the bulbs with two inches of soil, fill the trenches up as the plants grow.

Preennials grown from seed should now be large enough to set out the last of May in their permanent quarters in the flower garden.

A. O. G. writes: Can I grow asters in my tulip beds after they are done blooming?

Yes, we plant our seeds in plots or hot beds the last of April. Then transplant them in boxes or hot beds until the tulips are done blooming in June, then put your asters in the beds between the rows of tulips, the leaves will shade the plants from the sun.

May is the month to plant in open ground all hardy annuals, such as Arctotis Bartonia, Carepsis Gillia, Gomphrena, Marigold, Wall Flower, etc. Also half hardy annuals may now be sown such as Canary Vine, Balloon Vine, Gaillardia Schezanthus, also Mignonette where it is to stand, it does not transplant well. Morning Glory, soak the seed in warm water to aid germination. Nasturtiums, the vine kind, are particularly adapted to waste places. Plant Petunias and all members of the Poppy family, also Snap Dragons, Linnias and Sweet Peas, the last named as early in the month as possible.

Tender annuals, which includes Amaranths, Castor Beans, Colossa Hop, Ice Plant and Ornamental Gourd, may be sown in a hot bed in pots to hardened off and subsequently taken out for planting when the ground is thoroughly warm.

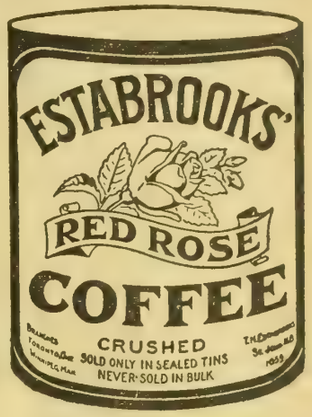
When all danger of frost is past, (usually about the middle of June here) say the first week in June, plant out all kinds of bedding plants such as Asters, Begonias, Colius Abutilons Cannas. Cannas are the best started in the house.

Dalhias may be planted the last of May. We do not sprout them, but put the bulb straight down leaving only a little of the old dead stalk in sight.

Plant Peonies and Lilies if you did not get them in the fall.

The new Crushed Coffee as compared with Ground Coffee

Merely to look at it you will see how very different it is; Crushed Coffee being in small even grains, totally free of chaff or skin while ground coffee has the appearance of being mashed; large and small grains with chaff or skin mixed together.



Red Rose crushed Coffee, being free of the chaff, can be made as easily as Red Rose Tea. Settles clear and bright. No egg or anything required. Just look at our crushed Coffee and see how correctly we describe it.

A good combination is Estabrooks' Coffee for breakfast and Red Rose Tea for other meals.

Estabrooks'

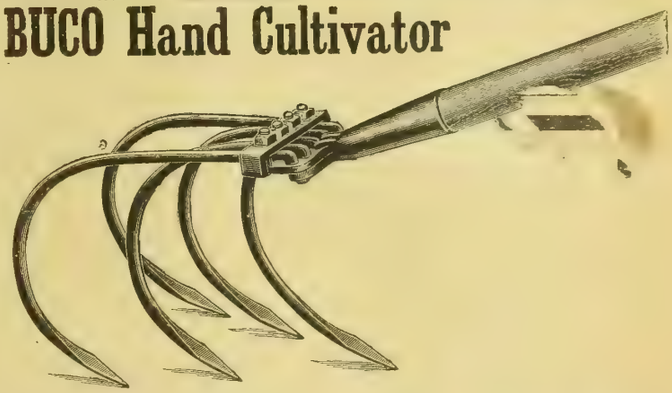
The BUCO Hand Cultivator

Handle 4 1-2 Feet Long



The greatest tool made for weed destroying and cultivation. It takes the weeds out BY ROOT, and loosens soil thoroughly to desired depth, leaving it fine and smooth. It gets over the work quickly, and saves immensely on labor. The prongs are OIL TEMPERED spring steel, and can be quickly adjusted to any desired width without removing. Head is malleable, and handle best white ash. Sold by hardware trade. If your dealer cannot supply them write us direct.

Manufactured by
Bailey-Underwood Co., Ltd., New Glasgow, N. S.

One writer says: I planted my vegetable garden in rows, putting a pinch of Shirley Poppy seed among the beets and carrots. They opened in every shade from the finest pink to almost black, the beet and carrot leaves making just the right back ground, making a very beautiful garden with so little expense.

Blue For-get-me-nots in company with White Tulip bulbs give a very pretty effect. White perennial Gypsophila is inexpressively lovely, blooms faithfully and makes a most delightful addition to a bouquet. Then there are the tall Shasta Daisies and White Cactus Dalhia, the stately Lilies and Holly Hocks are worthy additions as are also the Peonies and Iris. In the latter there are beautiful blues—all so pretty and lasting.

STOCK NOTES.

Pure Bred Stock for New Brunswick.

The sale of Clydesdales, Shorthorns and Ayrshires imported to New Brunswick by Mr. A. H. Thompson, at the request of the Department of Agriculture, took place at McGrath's Stables, St. John, on the 9th inst., F. L. Potts acted as auctioneer and W. W. Hubbard, Secretary for Agriculture and R. H. Arnold assisted Mr. Thompson.

Buyers got splendid value for their money. The cattle were especially imported to improve the dairy herds of the province, this being the first time in many years Shorthorns of the milking strain were offered to the farmers of Canada. With the exception of two Ayrshire bulls, and one of the Clydesdale mares, the purchasers were all made by New Brunswick people. The following is a list of the cattle, horses, buyers and prices.

Shorthorn Bulls.

No. 1—Doune Gladiator, red, calved May 5, 1909, purchased by Frank C. Smith for Dr. Judson Hetherington, Cody's, Queens county, for $135.

2.—Nugget's Pride, red calved July 10, 1909, Scott A. Shaw, Hartland, Carleton county, for $150.

3—White Emperor, white, calved July 28, 1909, Alfred W. Jonah, Hillsboro, for Albert county Agricultural Society, for $90.

4—Grandiant III, white, calved 1909, George A. Perley, Maugerville, Sunbury county, for $77.50.

5—Westward Prince, roan, calved April 20, 1909, W. T. Wood, Sackville, for $168.

6—Stanley, roan, calved June 5, 1909, Donald Fraser, Plaster Rock, for $135.

7—Keneth, roan, calved July 27, 1909, Albert Anderson, Sackville, for $169.

Total received for Shorthorns—$924.50.

Ayrshire Bulls.

11—Greenslack Great Fortune, red and white, calved March 30, 1909, J. F. Roach, Sussex, for $150.

12—Greenslack Better Fortune, chocolate and white, calved March 25, 1909, Alex. McDonald, for $100.

13—Adamhill Sambo, white, calved April 1909, Samuel Bigelow, Canning, N. S., for $105.

14—Adamhill Jumbo, brown and white, calved March, 1909, Samuel Bigelow, Canning, N. S., for $175.

There were three Ayrshire cows, but only one was sold, the others not being offered. Alexander McDonald, of Fairville, secured the one sold—Gardrum Flora 3rd, white, calved May, 1908, for $130.

Clydesdale Mares.

Jeannie Frew, dark brown, foaled June, 1907, A. E. Trites, Sussex for $275.

Princess Lorna, bay, foaled 1907, Retson Bros., Truro, N. S., for $265.

The Clydesdale stallion, Prince of Bromley, bay, foaled April 25, 1906, was withdrawn. The highest bid secured was $800.

The total amount received from the sale was $2,024.50.

Poland China Pigs.—Mr. Lemuel Cudmore, of Prince Edward Island, writes:—"Please tell me where I can procure pure bred Poland China Pigs."

Maritime Breeders of Poland Chinas would find it to their advantage if they would carry an advertisement in our columns.

The PUBLISHER'S DESK.

Lighting the Country Home.—Ten years ago, it was customary for the man who was showing his country home to his friend from the city, to say, apologetically, "Of course we haven't the conveniences here that you have in the city, but you can't expect to have everything you want when you live so far away from the city." In recent years, however, modern progress and invention have given more serious attention to the home in the small town, and there is a growing disposition on the part of

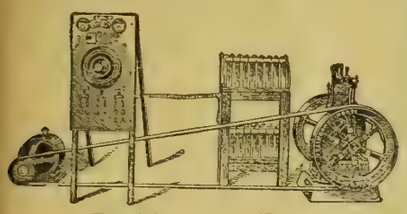
Our Grocery Catalogue is Mailed Free upon request

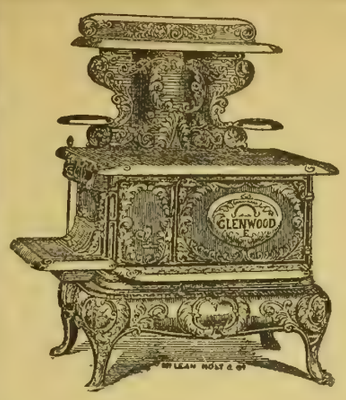
the man who dwells 'far from the madding crowds' to insist on just as much comfort as his city brother. It is now no uncommon occurrence to find a country home equipped with bathrooms, hot and cold running water and electric lights in every room. For lighting country homes several plans have been devised, but the most modern and successful is the electric lighting plant illustrated below.



Residence or Factory Fairbanks Morse Electric Lighting Plant.

This outfit will operate 50 15-watt, 12-C. P. Tungsten lamps as steadily and reliably as a city plant. It offers a relief from the dirt, danger and unsanitary condition arising from old methods of illumination, and gives an economical light that is both safe, convenient and healthful. In fact, there is no substitute for for the soft, white light diffused by Tungsten Lamps—it is even said to rival day light. The same engine can be used for operating a pumping plant or other machinery. The engine operates on gas or gasoline. The outfit includes a Fairbanks-Morse Special Gasoline Engine and Dynamo, Storage Battery, Switchboard, Lamps and Sockets. Everything is furnished except the wire which can easily be obtained anywhere. The Dynamo will operate 50-15 watt tungsten lamps for a fuel cost of five cents per hour with gasoline at ten cents per gallon. This is certainly very cheap, considerably cheaper than the city dweller can purchase his lights. The dynamo can be run during the hours when the most light is needed and the extra power is stored up in the storage battery. This arrangement makes the light available at all times whether the engine is running or not. When fully charged the storage battery will run 9 lights for 8 hours, 13 lights for 5 hours, 18 lights for 3 hours or 80 lights for one hour. The outfit is easily cared for, is durable afficient and occupies very small space and is proving wonderfully popular for high class country residences and farms. It is being sold in Canada by The Canadian Fairbanks Co., Limiteh.

Summer Resorts.— Experience, the testimony of thousands, and the popularity of the several fishing, hunting and tourist districts located on the lines of the Grand Trunk Ry. system, is conclusive proof that they are the Elysium of the sportsman, and the Mecca par excellence of the tourist. The "Highlands of Ontario" is a land dotted with lakes and rivers, rivers that have their source in the northern forests and flow until they join the vast inland seas, Superior, Huron, Erie or Ontario, whose waters are in turn, borne by the broad St. Lawrence to the Atlantic Ocean. This great Tourist Railway reaches all the principal resorts in this vast territory, including Lakes Orillia and Couchiching, the Muskoka Lakes, a popular resort 1000 feet above sea level, where thousands of people annually make their summer homes for rest and recuperation. The Lake of Bays District where some of the finest hotels in Canada are to be found and a locality replete with natural beauty gnd loveliness, with splendid fishing—Maganetwan River, the very heart centre for sport—for rod and gun—Lake Nipissing and the French River, where wild and rugged scenery is to be found, and the atmosphere filled with health giving properties, splendid fishing and hunting grounds are found in this territory. The Temagami region, a forest reserve containing 3,750,000 acres of lakes, rivers and wilderness, the scenic grandeur of which is incomparable. Magnificient fishing and hunting in season. The 30,000 Islands of Georgian Bay is another most helightful and beautiful territory, where the most interesting trips may be taken. The steady increase of travellers to this locality is alone proof that it is becoming the most popular resort on the inland lakes. The Algonquin National Park of Ontario, a comparatively new and attractive region, little known to the lovers of rod and gun and the tourist, has all the summer attractions that appeal to the denizen of the city. This territory has been set aside by the Provincial Government of Ontario solely for the delectation of mankind. The gamiest of black bass, speckled trout and salmon trout are found here in goodly numbers. Hunting is not allowed. The Algonquin Park covers an area of 2,000,000 acres, there being no less than 1,200 lakes and rivers within its boundaries. Good hotel accomodation is found in all the districts mentioned, and a postal card addressed to the General Advertising Department, Grand Trunk Ry. System, Montreal, will receive prompt attention, and illdstrated publications of any of the districts will be quickly sent to all enquirers.



No Matter Where you live, When you buy a Glenwood Range you Have the Same Advantage as Those Living in St. John.

In order to give the people in the Maritime Provinces who want one of our Glenwood Ranges the same privilige the people in St. John enjoy, we prepay freight to your booking station.

51 Ranges sold in April and 30 sold in May is record of how our Glenwood Ranges suit the people, what they are doing for hundreds they will do for you. We have them in all sizes and styles and we can give you ranges from $25.00 up.

Send for Catalogues, We make all our ranges in St. John, they have the material and workmanship in them, and every one will give you satisfaction.

McLEAN-HOLT & CO., 155 Union St., - - ST. JOHN, N. B.

Maritime Wire Fence Stands the Strain

of unexpected accidents, without a flinch. It holds under the most trying conditions. Maritime Wire Fence makes good because Maritime material is first quality, and Maritime workmen excel in their calling.

All Maritime Fence is made from extra heavy smooth No. 9 wire, so thoroughly galvanized that it won't peel. The Maritime lock holds the joints so rigidly that they can't give or pull out of shape. Maritime Fence is rust-proof, accident-proof, and as near wear-proof as man can make it.

8 Maritime Fence is your kind of fence—made as you would make it yourself—if you could. Maritime Fence is true economy for you. It is made and sold upon honor. Costs no more than inferior fence. Send now for our free fence booklet. Tells you everything you want to know about fences. Write while you are thinking of it. It will pay you,—pay you well.

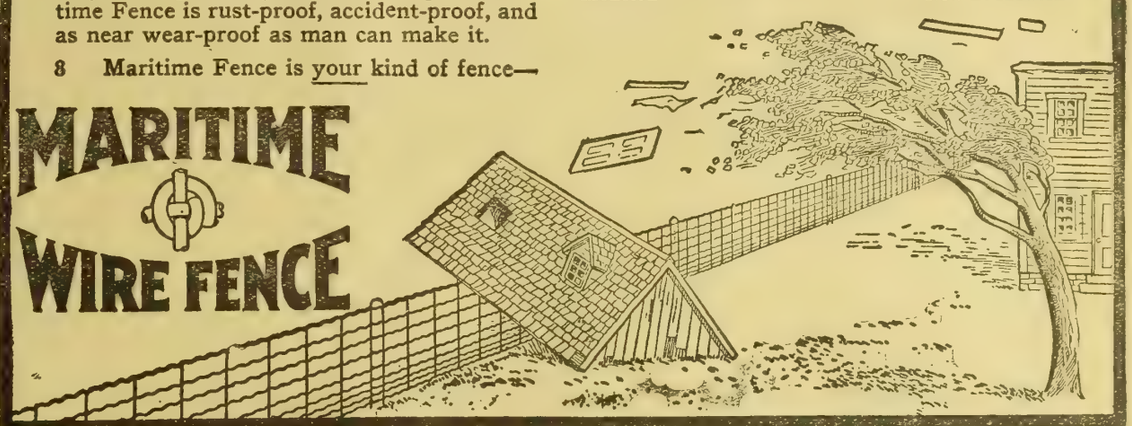
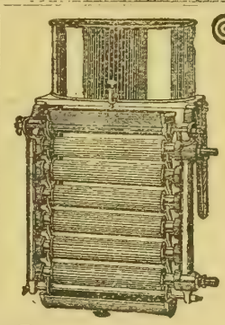
MARITIME WIRE FENCE





The Secret of Pure Sweet Milk

You dairy-farmers can't afford to ship impure, germ-laden milk into the towns and cities. Our medical authorities are urging the Government to penalize offending dairymen very severely—don't you run any risks. If you pass all your milk through the Root Cooler-Aerator **immediately** it leaves the cow, you can guarantee it pure and sweet and get a bigger price for it per gallon. The

Root SANITARY MILK Cooler-Aerator

will keep the milk sweet for 48 hours because it kills the animal heat quickly and cools the milk to the same temperature as cold running water. The water is admitted at the bottom, flows through the bottom tube, then from the water column into the second tube and so on until it reaches the top tube. Thus the cylinders are kept perfectly cold all the time, and as they are deeply corrugated the milk flows down them slowly, reaching the retaining pan thoroughly cooled and aerated. Cylinders are made of heavy copper, heavily coated with pure tin and guaranteed to stand heavy water pressure. Perfectly simple to operate—no complicated parts—a child can easily clean the whole machine in 5 minutes. Made in various sizes—will cool from 40 to 75 gallons an hour. Write us to-day for catalogue and prices—every dairyman should have a Root Cooler—it's a big money-maker. Address:

W. A. Drummond & Co., 185 King St. East, Toronto

MARKETS.

St. John Prices.

Flour is lower and cornmeal higher. Hard wheat patents, $6.15 to $6.20; choice patents, $5.65 to $5.70; medium patents, $5.60 to $5.65; oatmeal, $5.00 to $5.05; cornmeal, $3.15.

Cheese, 13c to 13½c; butter, 22c to 24c; eggs, 16c to 17c.

This ought to be a prosperous year in New Brunswick. So far as farming is concerned the season is several weeks ahead of last year. The country never looked better at this season. Pasturage is good, and there is every prospect of a heavy hay crop. The general seeding operations are well advanced. A larger acreage than usual will be planted in potatoes, for which wider markets have been found. Fruits promise well. With regard to the lumber business, while it is costing more than usual to handle the long drives the short ones cost less, and the proportion of logs hung up will be much less than was predicted some three weeks ago. Surveyor General Grimmer estimates that fully 280,000,000 feet of logs were cut on crown lands last winter, and there was a large cut on private lands, as usual, so that the quantity of material available for the mills will keep them well supplied throughout the season. So far as general industries are concerned, they are active, and building operations will exceed those of last year. There is still considerable work to be done in railway construction, in the province. Hence the general outlook for business is good. It is an interesting sign of the times that many applications are made for license to search for minerals in various counties, and there is a prospect that the mineral resources of the province will attract increasing attention. The optimistic spirit which was voted early in tne year is very general in New Brunswick, and 1910 is confidently expected to prove a year of healthy expansion.

Halifax Prices.

Beans, $2.05 to $2.25.

Peas.—Round, $4.75 to $5.00; split, $5.50 to $5.75.

Oatmeal, Standard in bbls, $5.40 to $5.50; Oatmeal, standard in bags, $5.25 to $5.35; rolled oats, in bbls., $4.65 to $4.75; rolled oats in bags, $4.50 to $4.60; Middlings, $25.50 to $26.50; Bran, $22.00 to $23.00; Shorts, $24.50 to $25.50; Feed Flour, bags of 98 lbs., $1.65 to $1.70; Cornmeal in barrels, $3.20 to $3.30; Cornmeal in bags, $1.55 to $1.60; Feed Oats, bulk 45c to 46c; Feed Oats in bags, 48c to 49c; Hay, $12.00 to $15.00.

Pork.—American Clear Fat Backs, $32.00; P. E. I. Mess, $29.00; P. E. I. Short Cut Backs, $29.50; American Bean, $30.00; Rumps, none; Jowls, $15.00; Pigs Feet, $6.50; Hams, 18c to 19c; Roll Bacon, 17c; Side Bacon, 20c; Lard in pails, 18c; Lard in cases, 19c.

Beef.—American, $20.00; Best Canadian, $19.00; ½ Bbls. Pork and Beef, 50c extra.

Island, per bag, $1.25; Turnips, per bag (2½ bu), $1.00; Rhubarb, native per lb., .02c; Celery, per doz. bunches, $2.00; Tomatoes, per crate 30 lbs., $3.50; Lettuce, per doz. heads, 60c.; Asparagus, per doz. bunches, $3.00; Strawberries, per box 16c to 18c; Cucumbers, each .05c.

Fowl, per lb., 15c.; Turkey (fresh killed) per lb, 17c to 18c; Lamb, (cold storage) per lb, 12c to 14c; Spring Lamb, per carcass, $3.00 to $4.00; Ducks, per lb, 15c to 17c; Beef, per lb., 9½c to 10½c; Mutton, per lb., 6½c to 7c; Veal, per lb, 6½c to 7c; Pork, per lb, 10c to 11c.

Charlottetown Prices.

Grains.—Oats, 34c to 40c.

Feed Stuffs.—Retail; Bran, $1.20 to $1.25; Shorts, $1.30 to $1.40; Middlings, $1.35 to $1.45; Oil Cakes, $2.25; Corn Meal, $1.75 to $1.85.

Live Stock.—Butcher's Cattle, 5½c to 6c live weight; Milch Cows, $30.00 to $50.00; Sheep, 4½c to 5½c per lb.; Hogs, young pigs, $6.50 to $8.00 per pair.

Dressed Meats.—(Carcasses) 10c lb; Mutton (Carcass) 8c to 9c lb; Veal, 4½c to 5c; Pork, 10c to 11c lb.

Dairy Products.—Creamery Butter, solids, 24c; prints, 25c; Dairy Butter, 20c to 21c; Cheese, none sold yet.

Poultry and Poultry Products.—Eggs, 15½c to 16c; Fowl, 10c to 12c.

Vegetables.—Carrots, 30c to 40c; Potatoes, 23c to 25c; Turnips, 14c to 16c; Beets, none offering.

Miscellaneous.—Hay, $10.50 to $11.00; Straw, $5.50 to $6.50; Wool, 22c to 25c; Beef Hides, 9c to 9½c; Calf Skins, 12c; Sheep Skins, 75c to $1.25.

Remarks.—The spring seeding is about all completed, and with the rains we have had prospects were never better for a generous harvest at this season. The hay crop being excellent. Trade in farm produce is very dull. Potatoes are scarcely in demand at all, in fact red potatoes are not saleable, a limited quantity of blues are being worked off at about 23c to 25c to the farmers. Oats are also very quiet with very little offering and shippers simply holding on to what they have as the shipments are small. A fair sized cargo left by Black Diamond boat for Newfoundland this week, consisting of potatoes and oats with deck load of cattle. The butter market is easy and prices quoted are higher than most factories would be willing to accept for round lots. Eggs have been dropping from time to time and we think they are not yet to the bottom. Wool is in good demand. All pork buyers, except Doris & Fraser, have discontinued buying and they will close on the 10th. The Cheese Boards have not yet had their first meeting, it will be held about the 17th, when the first cheese of the season will be offered. Trade on the whole is quiet.

Humus---Its Importance in Maritime Agriculture

By Prof. M. Cumming.

An examination of almost any soil shows it to contain not only mineral particles derived from rock, but also plant and animal remains. The forest soil contains a large amount of partially decayed leaves and stems, usually called leaf mould. Cultivated land is filled with fine roots which have served their period of usefulness to the plant and are gradually being decomposed. Swamp areas contain large amounts of black vegetable matter, which when the soil is dry, will burn, leaving behind the much lighter colored mineral part. In fact, in all soils there is some material derived from the growth and partial decay of plants and animals. To this material we apply the general term, humus.

We may, therefore, define humus as the animal and vegetable matter of the soil in intermediate forms of decomposition; and we may premise the statement that humus constitutes the most important material which enters into normal soil.

QUANTITIES OF HUMUS IN SOILS.

In good soils of humid regions, such as the undepleated soils of the Maritime Provinces, humus is present to the extent of .75 to 2.50 p.c. In rich prairie soils the percentage of humus may be as high as 3.5 p.c., and sometimes even more. In soils which have been long cultivated, without proper regard to rotation and without the application of barnyard manure, the quantity of humus present may be reduced to such an extent as to make cultivation unprofitable.

SOURCES OF HUMUS.

As already stated, humus in the soil is derived from both plants and animals. Plants are the chief source. In our forest soils, leaves, twigs, ect., fall to the ground and gradually, through the action of bacteria, are reduced first to leaf mould and then to more advanced forms of decay. Early settlers will generally tell of the large crops produced on the virgin soils reclaimed from the forest and they will also tell how much less their crops were affected by summer droughts than at the present time. Some farmers who have followed a rotation of crops and have regularly applied barnyard manure, will tell that their soils are, at least, as productive and, in some cases, more so, than in the early days when they were first reclaimed from the forest. An examination of the soils, owned by these farmers will always show as big a percentage of humus as existed when the soils, were first plowed but a general examination of the soils especially in the Maritime Provinces reveals a much smaller percentage of humus than at first existed and the returns show proportionately small crops.

HUMUS THE KEYSTONE OF SOIL FERTILITY.

The theme of this discussion is to show that humus is the backbone and life of our soils. If all farmers of the Maritime Provinces farmed with a view to maintaining or increasing the humus in their soils, there would be no run out farms and no deserted homes. But if, on the other hand, our farmers persist, as many of them have, in those types of farming which reduces the humus of the soil, there is nothing in store but runout farms.

AN ILLUSTRATION.

In the state of Minnesota, two fields, side by side, containing originally the same amount of humus, were farmed on different lines for thirty-five years with the following results: Field No. 1, cultivared 35 years with a regular rotation of crops and application of manure, contained, at the conculsion, 3.32 p.c. humus and was very productive. Field No. 2, orginally the same, continuously grain cropped contained at the end of 35 years 1.80 p.c. humus and was at a very low state of productiveness. The illustration typifies processes which have been and are now going on in many farms, not only of the Maritime Provinces but of the whole Dominion of Canada. The conservation of our farming resources demands that the farmers of Canada must conserve and in some instances build up the humus of the soil. We shall later show how this can be done, but in the meantime, will have something more to say as to what constitutes the value ol humus.

CHEMICAL COMPOSITION OF HUMUS.

There is no definite composition of the humus of the soil. It is as variable as the material from which it is derived and the conditions under which it is formed. Since, for the most part, humus consists of vegetable remains, it naturally contains all the elements of plant food required for the growth of new plants, but it contains these in varying proportions. Humus for example, formed from a clover sod or from the manure from well fed stock is much richer in nitrogen (The most valuable element of the plant food) than humus from a timothy sod or oat stubble or from the manure from poorly fed stock; and humus from such a substance as sawdust is still poorer in nitrogen and is very much inferior in value to that from the first mentioned sources.

Humus contains organic acids, ments of the soil, such as lime, which unite with the mineral elemagnesia, phosphorus and potash. The term humates is applied to this combination. In the lertilizer factory, the manufacturer treats raw bone with an acid (sulphuric is the most satisfactory) and by this means renders the phosphoric acid soluble. In the same way the acids of humus will act upon the natural phosphate as contained in bone rock, etc., and render them soluble and so available for plant food. These vegetable acids also combine with various minerals in the soil and by doing so, set potash free from combination and make it available for plant food.

EFFECTS OF HUMUS.

Effects of humus on soil and there reby upon plant growth, are numerous and far reaching. They are of three sorts, (1) Physical, (2) Chemical and (3) Bacteriological.

(1) Physical: (a) It improves the tilth of the soil. Clay soils which are almost impossible of cultivation, become quite friable when sufficient humus is incorporated to lighten their texture and admit air. Sandy soils, which are otherwise too light and liable to be drifted by the wind or washed by rain, are bound together by the presence of humus and so improved in character.

(b). Through improving the structure of the soil, humus greatly increases its moisture holding capacity. Pure humus will absorb from 200 to 300 percent of its dry weight of water, as compared with 10 to 15 p.c., for sandy loam and 25 to 35 p.c., for clay loam. It, therefore acts as a sort of reservoir for water and enables soils to resist droughts. Those whose fields are rich in humus know how much better plants grow in these soils during a time of drought than in adjoining soils, which have become depleted of their humus.

(c) Humus imparts to soils a dark color and since dark colored objects always absorb more heat than light colored objects, it is easy to understand the fact that soils rich in humus may have a temperature of as much as 8 or even 10 degrees higher during sunshine than soils devoid of humus. Seeds therefore, have a chance to sprout and young plants to grow more quickly in humus rich than in humus poor soils.

(2) Chemical. (a) Since humus consists of the remains of former plant or animal life, it naturally follows that it contains all the elements necessary for the growth of future plants. It is, therefore, a direct source of food elements. Farmers have no doubt observed that bone meal and other fertilizers will give better account of themselves in soils rich in humus and that they give very indefferent returns on soils free from humus.

(b) As already explained, humus contains organic acids, which act upon the inert mineral elements of soils and render the plant food contained in them available for plants.

(3) Bacteriological.—(a) The presence of humus in soils leads to an increased number of soil bacteria and it is almost an invariable rule that the more numerous the bacteria, the more fertile the soil. In soils poor in humus we have found scarcely more than a few thousand in an ounce; whereas in soils rich in humus we have found as many as 400,000,000 to 600,000,000 per ounce.

We have now briefly shown the nature and importance of humus and, therefore, come to the most essential part of this paper viz., how to maintain or increase its supply.

HOW TO MAINTAIN OR INCREASE THE SUPPLY OF HUMUS.

There are three methods which are resorted to a greater or less extent in order to accomplish this desired end; (1) The feeding of all produce raised on the farm to stock and the application of barnyard manure to the soil. (2). The plowing under of crop residues, especially clover. (3). The plowing under of green crops. The most important of these, and that which must receive greater attention in the Maritime Provinces is the first. With this I dealt pretty fully in my last address before this body and I will therefore refer to only a few additional particulars which were not then discussed. These relate to the preservation and care of barnyard manure.

If barnyard manure is not carefully preserved, it is possible even in the course of a very few months, to allow 50 p'c. of its humus and approportionate amount of its nitrogen to pass off in gases into the air. The ideal way to get the most humus and plant food from barnyard manure into the soil is to apply to this land as quickly as possible after it is made. If, however, owing to fear of surface washing or through not having land in shape to apply it, barnyard manure must be kept either in the yard or in heaps in the field, particular attention must be paid to preventing leaching and heating. Both of these may

prove serious sources of loss, but of the two, it has been our experience that fermentation is by all odds the most troublesome. To prevent this, manure must be kept as compact as possible, so as to prevent the free circulation of air which is essential to the early stages of fermentation.

(2) The Plowing under of Crop Residues. The residues from such crops as oats, roots, etc., are very small, as compared with the residues from a good clover growth, or even from a good grass growth. If therefore, one persists in the growing of either roots or grain he will quickly deplete his soil of humus. So also leaving land to hay for a great many years without plowing will lead to a depletion of humus. But if a regular rotation of crops is followed and particular reliance placed upon clover, the supply of humus can be very fairly maintained. If with this barnyard manure is regularly applied, there need be no loss but rather a gain in humus.

In our experience, a rotation which has led to the satisfaction.
has led to the satisfactory maintenance of the humus supply is a four year rotation, consisting of one year hoed crops, one year grain, and two years in hay. In seeding down our hay, we would always use a larger proportion of clover than of timothy seed. Sometimes we have extended this into a five year rotation by putting in a crop of oats in the year succeeding the second crop of hay. When this done we do not hesitate, even if the intention is to get the land ready for roots the following year, to sow at least, from 6 to 10 pounds of clover, the growth of which plowed under in the fall will serve to, at least, maintain and, in good seasons, will slightly increase the amount of humus. To some this may appear a wasteful practice, but they will observe that by following other practices their fields have become less productive, due to the fact that the growing of the grain crop without seeding down the land will quickly deplete the store of humus. In cases where it was sought to build up the farm quickly, we have often known the owners to resort to a three year rotation, consisting of a hoed crop, followed by grain seeded down most to clover, thus producing a clover crop for the third year, the after math of which is plowed under in the fall. In general farming, however, where the soil is in fairly good condition, this short rotation necessitates more labor than is ordinarily available. Perhaps the majority of Maritime Province farmers would leave their land down to hay for three or four and sometimes more years. Those who do so must recognize that such a practice reduces the store of humus and gradually leads, to the system of run-out farms which is altogether too prevalent in our provinces today. However it is decided to work it out, we cannot too strongly recommend the practice of plowing under a clover sod as frequently as possible.

(3) The Plowing Under of Green Crops. This we may regard as a heroic measure. Nearly all orchardists practice it, but under a system of general farming, provided a farm is in good shape, we would seldom resort to this. If field is run out, which almost always means that it contains too small a supply of humus; then humus must be added to it. If barnyard manure is available, an application of it will accomplish the result. But if barnyard manure is not available, then humus must be added by plowing under a green crop. For this purpose, two classes of crop may be used. (1). Non-leguminous crops, like buckwheat or rye, which when plowed under add vegetable matter but do not add to the store of nitrogen; and (2) Leguminous crops, such as the clovers, peas, vetches, which when plowed under not only add humus, but also nitrogen. Actual records kept show that by plowing under one of these leguminous crops an increase, of nitrogen has been effected to the extent of from 50 to 200 pounds per acre, which at commercial rates would be worth $7.50 to $30.00 per acre. Wherever they will grow at all satisfactorily leguminous crops should be used. However, it often transpires that it is desirable to increase the humus of a field which is too poor to yield a good growth of any of these leguminous crops. Under these circumstances resort must be had to plants belonging to Class (1). In the spring of 1908 we sowed buckwheat on a field, which from previous experience with adjoining lands, we knew would not produce a paying crop of oats or hay and which we also knew would not grow a sufficiently luxuriant leguminous crop to be worth while. In orper to give the buckwheat a little chance we sowed on part of the land a very slight application of commercial fertilizer and on the remaining part a small quantity of barnyard manure (5 or 6 loads to the acre, being the scrapings of the barnyard.) By this means we grew a fairly good crop of buckwheat, which we plowed under when in full bloom in the month of August. We immediately harrowed this land and got it into shape by the first week in September for Fall Rye. This produced a splendid crop in the following June. We plowed this under and then sowed the land again to buckwheat and secured a splendid crop of buckwheat grain. We sowed a little clover with this which came on very well after the buckwheat was cut, and consider that the land is now in good enough shape to sow to grain and seed down in the ordinary way. Those people in the Maritime Provinces who have run-out fields from which they are now getting no returns but which they wish to bring in as cheaply as possible, will find some such things as this a good means to resort to.

COMMERCIAL FERTILIZERS AND HUMUS.

During the past few years such commercial fertilizers as Bone Meal, Basic Slag and various mixed grades of fertilizers, also such amendments as lime, gypsum, mussel mud, etc, have been extensively used to cause run-out fields to come back to their former productiveness. Oft times the first and sometimes the second application of these have given splendid crops of grain, but latter applications have usually proven very disappointing. We will first consider the application of lime, gypsum and mussel mud. All of these are valuable because of the calcium which is the active principle which they contain. All lead to the quick decomposition of humus. Everyone knows that if you add lime to a refuse heap or a compost you will hasten its decay. The same is true when lime in any form is added to the soil. Probably all are familiar with the old saying that "lime enriches the father but impovrishes the son," and probably many have already learned that whilae mussel mud or pure lime or gypsdm may give good returns at first, yet they will ultimately yield very poor returns. The reason is that lime in any form will quickly impoverish land of humus and unless an effort is made either by applying barnyard manure or frequently plowing under clover sods or green crops, to keep up the store of humus, the land will quickly become unproductive.

Such fertilizers as Bone Meal, Basis Slag and the various mixed fertilizers differ from lime, mussel mud, etc., in that they contain large quantities of the essenlial elements of plant food, viz;, nittogen, phosphoric acid and potash. From this standpoint they are not as exhaustive of the soil as lime, etc. However, these do not contain humus and unless properly used, they will not add humus to the soil. We have known of farmers applying bone meal, for instance, to low producing fields and to have harvested from this application a large crop of oats, etc., but when the practice has been followed up we have observed very much poorer results. The reason for this is that the owners have not paid attention to maintaining a supply of humus. All these fertilizers differ from barnyard manure in that they do not contain humus, whereas barnyard manure does. If they are to be used judiciously with a view to keeping up the fertility of our lands, their use must be accompanied by the frequent plowing under of clover sods and, in extreme circumstances, by the plowing under of green crops.

There is another side to this fertilizer question, which is that, one will always get bigger returns for the money invested in them if he sees to the maintenance of the humsupply supply of the soil; whereas, if he loses sight of this he will not get back in his crops even enough money to pay for the commercial fertilizer he may buy.

The western plains are more fertile than the east, because for generasions the grasses which have grown on these plains have been allowed to die and remain where they grow. This accumulation of vegetable remains had been going on for many years. At the present time, the majority of our western farmers are recklessly reducing this supply of stored-up humus, and have, in some cases, already reduced to such an extent as to make wheat farming unprofitable. Their methods have been aptly termed as "surface mining." If continued in, these exhaustive methods will lead to such a depletion of the stored up humus as to make farming in these regions quit? as difficult as in the most run-out of these. It is to be hoped, however, that the farmers of the west will learn the lessons of the east and will conserve the stored up humus which makes their soils so fertile. And we of the east can only hope that all of our farms will adopt the practices of aur best farmers and will feed more stock and produce more manure and grow more clover, following shorter rotations and so build up the supply of humus on our farm lands. When this is done, there will be no more run-out fields, no more deserted homes and prosperity will be in evidence everywhere. The road is not an easy one, but many of our farmers have already travelled it and have achieved success. It remains for all to recognize these underlying principles which are in the very nature of things and which, when studied, and made the rule of their practice, will lead to success just as surely as any line which they may follow.—An address by Prof. M. Cummings at the recent Provincial Seed Fair, Summerside, P. E. Island.

Practical Results of Underdranage.

Some years ago the Department of Physics at the Ontario Agricultural College began teaching the subject of drainage. This led to a study of drainage conditions throughout the Province. It was found that thousands of farms, amounting to millions of acres, were so wet as to produce only about one-quarter to half a crop, while others, once wet and almost useless, had been transformed by underdrainage into the most productive in the land. These observations led us to begin a movement for the spread of information regarding tile drainage, by sending drainage advisers to any farmer in the Province who might apply for assistance, to survey his land for drainage purposes, determine the best system of drains to adopt, the grades of drains, sizes of tile, etc. The idea proved popular, for during 1906, 1907 and 1908 several hundred farmers applied for and received assistance in this way. In the spring of 1909 the Department wrote a large number of them, asking if they had put in any of the drains laid out for them, and if so, to give their experience, paying special attention to cost of drains, difference in dates of seeding, difference in growing crop and increase in yield. A few others, for whom no surveys had been made, but who had done draining in previous years, were also written to.

WHAT PEOPLE SAY ABOUT UNDERDRAINAGE.

The reports showed even greater results from drainage than we had anticipated, and in submitting a paper on the practical side of this subject, perhaps I cannot do better than present quotations from a number of the letters received.

QUOTATIONS FROM REPORTS BY MEN WHO HAVE DRAINED.

William Bell, Washago, Simcoe.—"I drained eight acres you surveyed for me in 1907. It had produced nothing previously. Last year I grew a fairly-good crop, of oats on it, which yielded, thirty-three bushels per acre. Following is a statement of outlay and results:

Cost of draining eight acres, $290.90, or $35.11 per acre, including a six-inch main to drain other land as well as this.

Returns—Thirty-three bushels, oats at 45 cents, $118.80, nearly half cost of drainage, and straw yet to be accounted."

J. H. Clare, Chapman, Hastings.—"Fields that previously were unfit for crops at all, can now be seeded on even date with high land, and, while before, they grew nothing but course grass, now they yield per acre:

Hay .... 2 to 3 tons
Barley ....30 to 50 bushels
Oats .... 40 to 100 bushels
Corn .... 14 feet high

James Clayton, Cedar Springs, Kent.—"In 1901 I drained eight acres, at a cost of $112, or $14 per acre. Eight acres right across the fence were not drained. In 1902 both fields were sowed to beans.

8 acres drained land gave 302 bushels, which sold for $456
8 acres undrained land gave 24 bushels. which sold for 37

Gain $419

Nearly four times the cost of drainage."

Author's note.—This example shows the value of underdrainage in specialized agriculture.

"In 1903 both fields grew fall wheat.

8 acres drained land gave 45 bushels per acre.

8 acres undrained land gave 25 bushels per acre.

Gain—Twenty bushels of wheat per acre.

1904—There was drained land on both sides of that fence."

George J. Coad, Oakwood, Victoria.—"I drained a piece of land last fall.

Before draining it would grow only a water weed.

Now, July 1st, it has grain on it as good as anywhere else on the farm, twenty-one inches high, as you will see by the sample I am sending, but the water weeds are too small to send a sample of."

W. J. Cohoe, New Durham, Brant.—"About two-thirds of the oat field was drained last fall, and this went in in good condition, April 30th. The rest of the field is porous soil, but

rather level and higher than the drained part, and we sowed it three weeks later, and I must say it was not really fit then; but anxious to get it sown, we 'mudded it in.' "

Nathan Day, Powles Corners, Victoria.—"I drained a ten-acre field some fifteen years ago, at a total cost of $145. or $14.50 an acre, the drains being four rods apart, and two and a half feet deep. It was a muck soil, from a foot to a foot and a half deep, underlaid with a heavy clay. Before draining, it was the wettest field on the farm, and would grow only hay and oats, and never more than a half crop of them, and was never sowed before June. Since draining, is is second driest field we have, and will grow a full crop of anything that can be grown on the high land of the farm. It has been sowed in April every year but one since it was drained. The drains paid for themselves in two years. If I were draining this field again I would put a drain every two rods, for the crops are always better right over the drains than half way between."

F. W. Huntley, Sutton West, York.—"We drained part of the land surveyed, and this year a fine crop of fall wheat is growing on land that formerly was counted too wet for anything but meadow."

Joseph Lamb, Brantford, Brant:—"I think underdraining the best investment I can make on my farm."

William Lapp, Cedar Grove, York.—"I drained five acres with drains one hundred and twenty feet apart, (one hundred and ten rods, or five acres).

Drained another field with drains thirty feet apart, and three feet deep. In each case the gain in the first crop paid the full cost of the drainage.

My general conclusion is this. Where drainage is at all required, its entire cost will be repaid by the increase in the first two crops, but in most cases by the increase in the first crop alone. Our own experience is the latter."

A Leach, Farm Manager for W. F. McLean, M. P., Donlands, York.—"The cedar swamp field south of the barn, which you surveyed, and which you will remember, was so wet, even in the dryest part of the summer, that one could not walk on it without getting wet, was drained last fall, and this year, in spite of the heavy rains which delayed all spring farming operations, it was the dryest field we had when we came to cultivate it, although much of our land is high and rolling. The crop sowed on it is coming on fine, and gives every indication of good, stiff, strong growth."

James Marshall, Hamilton, Wentworth.—"In fifteen years I have put in over twenty miles of drains on my farm, and my only regret is that I have not used more of the time God has given me to complete the underdraining and bring the whole farm into a better state of cultivation. In 1897 I drained a twelve-acre field at a cost of $460, almost $40 an acre, drains being twenty-five to thirty feet apart, and three feet deep. The next year this field yielded eighty bushels of oats per acre, while the adjoining field, of similar soil, but not drained, yielded only forty-five bushels per acre, thus gaining thirty-five bushels of oats per acre by drainage."

Author's note.—Price of oats by to-day's paper, forty-four cents. Value of thirty-five bushels at .44-$15,40, considerable more than one-third price of drainage, and the increase of straw yet to be counted.

"Another year I got the following results '

45 bushels wheat on drained.
25 bushels wheat on undrained.
Thus gaining twenty bushels."

Author's note.—Wheat to-day, price $1. Value of twenty bushels, $20. Over half cost of drainage, and straw, yet to be accounted.

R. H. McCurdy, Vienna, Elgin.—"Last fall I drained two acres that formerly would grow nothing. They were low spots in a field. Cost, $17.50 an acre. This year I had thirty bushels of fall wheat per acre on them, while the higher land gave only fifteen bushels. The drains more than paid for themselves with this one crop. The whole thirty bushels was gain, as these spots would grow nothing before."

Author's note.—Value of thirty bushels at to-day's market price, $30.

John McIntaggert, Brechin, Ontario.—"Last fall I drained the lowest of the land you surveyed, putting in over five hundred rods of tile drains. Other years I was unable to work on it till the last of seeding, but this year it was the first ground I could work on, and was all of a month ahead of high land."

Author's note.—With regard to Mr. McIntaggert's case, a very interesting fact came to my notice recently. His drains, about five miles, on fifty acres, were laid out by the Department in June, 1908, and at the conclusion of the survey a drainage demonstration was held at which many of the neighbors were present, one of whom applied for a survey of his farm, but it could not be undertaken then, and was later turned over to Mr. J. H. Hare district representative of the Department of Agriculture at Whitby Collegiate Institute. In June of the present year Mr. Hare went to the locality to make the said survey and in the meantime Mr. McIntaggert had put in two and a half miles of drain on about twenty-five acres, and the neighbors had been watching results. What they thought may be judged from the fact that Mr. Hare had to make nine surveys instead of one before leaving the community.

J. P. McKim, Caledon, Peel.—"I have drained some muck holes, which were always so wet, that we had to sow around them, even in a dry spring. This year, they were the first of the field ready to sow. I cannot compare dates as I never could sow them before."

John A. McMahen, Petrolea, Lambton.—"This year, 1909, I had barley sowed on drained, and on undrained land. The drained land yielded fifteen bushels more per acre than the undrained, and twice as much straw."

Peter W. Scott, Belgrave, Huron.—"The lowest field on my farm, has drains one hundred feet apart, and this spring it was the driest field, and ready to cultivate the earliest. I consider in a year like this thorough drainage, doubles the value of land for cultivation."

Smart Bros., Collingwood, Simcoe.—"We put down some seventeen thousand feet of tile drains last fall, according to your survey, and everything worked out perfectly. The cost was $973. The greater part of the land drained, had never been cropped before on account of being too wet, but this year, we have tomatoes planted on some of the lowest of it, also carrots, beets, and parsnips, etc. We would not think of working undrained land in our business. We cannot say to much in praise of the drainage work of your Department, as we have done considerable tile drainage before, and therefore know the advantage of your system."

Only one report was received of ununsatisfactory drains. One gentleman said: "The drains I put in did not give me satisfaction. The most trouble I had with the land was that it dried out before I could get to plow it, or, in fact before the other ground was ready, and got hard." The reader will appreciate this at its full value.—Prof. W.H. Day

Maritime Agricultural Prospects.

The farmers of Upper Sackville are jubilant over the prospects for a heavy crop of hay on their marshes. Where the marshes are well drained and properly seeded the growth is all that could be desired and stands out as an object lesson to those who neglect their marsh lots. The growth on the undrained areas is rather sparse. In years gone by timothy hay took precedence in our markets, but now that farmers are beginning to realize the value of clover growing as a valuable asset in maintaining soil fertility and as the demand for clover hay is increasing for stock feeding purposes, the farmers are sowing greater quantities of clover seed every year. The present prospects are that haying will start this year very early in July, as some fields are now showing signs of lodging.

Some of the farmers in the vicinity of Amherst complain of a rather sparse growth on the marshes. Owing to a break in the dykes last fall the tide damaged fields that had been put in excellent condition for heavy crops of clover.

There is still a great quantity of last year's hay in stacks and barns on the marshes. The hay presses are working and the old crop is being gradually shipped but the prospects are that quite a large quantity of last year's crop will not move out before next fall as the demand, last winter, was not exceedingly heavy and not a few farmers held their crop for higher prices. Others who refused a fair price last fall were glad to dispose of some of their crop this spring at lower figures.

A visitor to the Experimental Farm, at Nappan, N. S., will be well repaid for his visit. The weather has been rather unfavorable in that vicinity for those who do work on an extensive scale and has caused the work to drag longer than Mr. Robertson, the genial manager of the farm would like. The crops that got an early start are in excellent condition. Turnips sown on June 11th could be plainly seen in the rows on June 17th. The orchard is in a particularly thrifty condition and the cover crop of Crimson Clover is now being plowed under. The clover is in full blossom and fully three feet high. The reader can imagine the large quantity of humus that this crop will form in the soil. Nearly a carload of steers are being finished for the midsummer markets. Mr. Donaldson who has charge of the apairy on the Experimental Farm has had very good luck with his bees this spring. Some of his colonies have quite a surplus of comb honey and in the course of a day or two the extractors will be started.

The acreage devoted to turnip growing is very much increased this year in all parts of the Maritime Provinces and is one of the sure indications that farmers are beginning to pay more attention to the feeding of their live stock for profits. The sowing of green crops for soiling purposes is also rapidly gaining in favor.

In the vicinity of Sussex, the farmers are taking a great interest in Alfalfa growing, spurred on by the successes obtained by some of their number who have given this valuable plant a square deal. Mr. Wm. McLeod, Sussex, has quite a large plot from which he has been soiling his cows for over a month. Those who succeeded in getting a proper inoculation of the Alfalfa seed have no trouble in getting it to grow and some of their plots are now from two to four years old. Instead of using commercial nitro culture this year, Mr. C. W. McDougall, Dairy Superintendent, who has been largely instrumental in arousing a healthy interest in Alfalfa growing, is distributing to all those wish to start small plots, small quantities of inoculated soil from his own plot which is fairly teeming with bacteria bearing nodules. The Sussex and Studholm Agricultural Society has placed the sum of fifty dollars at Mr. McDougall's disposal for the purpose of awarding prizes for the best plots of Alfalfa in the vicinity of Sussex during the seasons of 1910 and 1911.

They have also forwarded a memorial to the New Brunswick Department of Agriculture asking that something be done re awarding future prizes in Alfalfa growing in New Brunswick in the year 1915 along the same lines as is now being organized in the Province of Saskatchewan.

The field meetings held under the auspices of the New Brunswick Department of Agriculture are proving both popular and instructive.

In Nova Scotia excursions to the Agricultural College at Truro are rapidly gaining in favor and each and every visitor derives a lot of benefit from seeing how the work of crop growing is conducted. Prince Edward Island and New Brunswick farmers would profit by visiting the College Farm. We know the college staff would give them a hearty welcome.

Underdrainage is receiving a great deal of deserved attention now-a-days and the farmers are all interested in the work that is being done by the traction ditcher recently purchased by Prof. Cumming.

How to Cure Clover Hay.

Haying will soon be on, and farmers will be busily engaged in harvesting this most important crop, says C. A. Westover, of Mississquoi Co., Que. As hay forms such a large part of the winter rations for our live stock, we ought to be careful to save it so as to get the very best quality. With us timothy forms the greater part of the crop, with a small acreage of clover, and both are cut before they are ripe, if the best quality of hay is to be secured. Late-cut hay may give a larger yield in pounds per acre, but it will not be so digestible as that which is cut early. Clover is generally cut when about one-third of the crop is in bloom, as at that stage of maturity it is still tender and nutritious, and a good aftergrowth is secured to supplement the pastures where they get short in the fall.

Timothy is cut after it is headed out and flowered.

When the clover has arrived at the right stage of maturity, we begin to cut in the morning as soon as the dew is off, and cut as much as we can get into cocks before the dew falls at night. After it has wilted in the swath for a couple of hours the tedder is put on, and about the middle of the afternoon, it is raked into winrows with an ordinary eight-foot dump rake and made into small cocks containing about three forkfuls. It is allowed to stand for about two days, and the cocks are then opened for an hour or so if it is very green inside, and after opening it is hauled to the barn in good sized loads.

Clover cued in this way comes out of the mow green and palatable, with most of the leaves intact, and they are the richest part of the hay. Timothy does not need to stand quite so long in the cock, as a rule, but otherwise it is treated about the same as clover. Hay cured in this way makes more work than when it is left to ripen before cutting, so it can be cut and drawn the same day, but the difference in feeding value is greater than the difference in cost of production.

THE MARITMIE FARMER

And Co-operative Dairyman.

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers, and Dairymen's Association of New Brunswick; The Nova Scotia Farmers' Association The Nova Scotia and P. E. Island Fruit Growers' Associations The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers Association, and The New Brunswick Poultry Association.

COUNTRY VS. CITY LIFE.

With the bettering of the conditions existing on farms it ought to be impressed upon our youths, both boys and girls, that farm life, with all its outdoor joyousness and freedom, offers more in real living to the man and woman than does the city. If this were believed in the "teens" of a person's existance, fewer men would drift into the mediocre life of the average city inhabitant. The scorn that a jolly, independent, country-loving resident feels for the "tether-tied" existance of the average city man is born of the "right of his eminent domain" that fairly pulsates through his vigorous rustic frame. Too few of our farmers instil into the young the love of nature and the glories of an open-air existance. Too often the troubles and worries, self-imagined, are allowed to obtrude upon the generally optimistic lives of our young people. When we find in a large city that the great majority of the people are living from "hand to mouth" we must stop and enquire after all, do they get the worth of their whistle? To have a detached eight or ten roomed house like many farmers enjoy the city man must pay a rental or tax of many hundreds of dollars. We will place it at $600 a per year. The generous supply that flourishes at our country festive boards would cost the townsman another $200 extra per year. Useless attractions, excursions, and sight-seeing over and above the necessar needs of such, run away with many more dollars. Thus the farmer is assured in residence, food, health, and independence almost $900 of a start per year above his city friend. What money the salaried men gets, exceeding this amount, is used for clothing, education, church, etc. In the end his bank account is not swelled very much more than the provident farmer's. It may be objected that the life is too monotonous on the farm and the chances of learning and of education are so poor that a less spacious life in the city is preferable. This has been a vailed reason too often heretofore. But earnestness and persistance in agricultural legislation and education are giving the farmers improved machinery, telephone communication, daily papers, electric railways to the large centers, rural mail delivery, and houses equipped with all conveniencies. He then becomes the most envied of men. His life is a busy one, but one of cheer, health and business integrity. Such is no dream of a Utopian, but a life that every farm boy can aspire and attain, if he will buckle on an optimistic determination to make the old farm a modern paying and educating enterprise. There is room in ahe Maritime Provinces for the grandest of lives on our splendid situated farms, and we trust we will hear of less numbers of our good young men leaving these choice fields for speculative allurements of a shut in city life, or the blandishments of a newer civilization.

HOW TO PRODUCE GOOD ANIMALS.

Good animals are produced by good feed, good care and plenty of it. The farm where good stock is kept must be well kept. It will not do to abuse the farm by eating out the pastures and impoverishing the land. Good, well-kept farms and good stock very natuaally go together. A big, rank growth of grasses where the animals wade around in the pastures is much more conductive to thrift and growth than where they are obliged to spend all day and part of the night in search of enough feed to partially satisfy their appetites. The constant hunting and anxiety of the animal, the nibbling process that must be energetically kept up in order to sustain life is a waste of energy and waste of flesh. It puts the animal on a system of decline rather than one of vigorous development.

One of the very common mistakes made on many stock farms is overstocking, trying to keep more animals than can be profitably and properly kept. This is not a difficult thing to detect. Any observing feeder or breeder should be able to pick out these places as he drives through the country. It is not necessary even to see the animals. The pastures show it first. Hog lots and cattle lots and yards are very naturally supposed to be bare ; they are not intended to produce a living for the animals kept on the farm. They are merely conveniencies for yarding where the apportioning out of prepared feeds designed for the animals is usually done. But the pastures adjoining these yards are supposed to contain an abundance of good, succulent feed for the growth and development of the stock.

In the production of good stock good feed conditions must first be provided. This means good farming, and good farming is at the basis of every successful farm industry or enterprise. The feed supply must not only provide for the grazing season, but for all seasons. The winter season or prepared feed season is the most critical period in the growth of the animal, because the natural conditions of vegetation must be supplied as far as practicable by the storage and preservation of succulent feeds for winter use.

A NOVEL MARKETING SCHEME.

On another page of this issue will be found an article entitled "A Novel Marketing Scheme" which we reproduce from an Orange Judd Farmer clipping recently sent us by Mr. R. J. Messenger, Bridgetown, N. S:

We have on several occasions referred to the co-operative spirit that should exist between the country merchants and the farmers of their respective districts. It is not an uncommon complaint among country merchants that the various households in their vicinity are ordering nearly all their staple and fancy goods—everything from mail order houses and that as a consequence their trade is very much injured. Merchant's Associations are constantly clamoring for a certain amount of redress in this line by asking for certain semi-prohibitory rules and fees. We are personally acquainted with some members of mercantile associations, who are always loudly denouncing the residents of rural communities who patronize mail order houses. When a farmers' meeting is held in their locality they seem to give their noses an upward turn and say "we are not interested in farming" and make themselves conspicuous by their absence from such meetings, whereas they should be on hand to help along the cause of advancement along lines pertaining to Agriculture in their respective districts. It would be well for our readers to draw the attention of their merchants to the article referred to and who knows but that they may glean an idea from the action of their Geneseos friends that will redound to the mutual benefit of all concerned.

ECONOMY IN PRODUCTION.

It is not enough to produce a crop on the farm, but it must be produced under strict methods of economy. This means the greatest possible yield for the least possible cost. The handling of the farm means much more now than when lands were low-priced. There is a greater demand in getting a profitable yield of the crop produced. The best paying market crops are studied more carefully now as to demand and to probable yield. The question of soil fertility is also taken into account in the planning of the crops to be produced.

The idea that crops can be produced from lands and still increase the producing power of the land is being taken up in view of soil improvement where deterioration exists. Soil improvement is where the land owner looks to the land for part of his profit in farming instead of expecting it all to come from the crops produced. Feeding the soil by crop rotation and crop fertilization is in the line of economy in production.

Economy in production may also be practised in the selection of crops that are in greatest demand in the markets of the country. The profitable crop, the easily marketed crop, the crop that offers strong resistance to perishable influences, the crop that has an every-day demand, should be studied in view of its adoption into the list to be used.

INVESTIGATING P. E. I. CHEESE TROUBLES.

Receivers of Prince Edward Island cheese in Great Britain have made some complaint to the Dairy and Cold Storage Commissioner, Mr. J. A. Ruddick, respecting the heated condition of several shipments via Halifax during the season of 1909.

With a view of finding the weak spots in the transportation between the factories in the Island and the docks in Great Britain, the Commissioner is arranging to assign an officer to the duty of watching the shipments from the Island during the present season. The cheese will be followed at every shipment during the hot weather from the factories to the wharf at Halifax and accurate records of temperature and other conditions will be noted at every point. Recording thermometers will be used in the cars and on the ferry steamer, and these instruments will also be placed with the cheese in the holds of the steamships before they leave Halifax.

This defect of "heated flavor" which at one time threatened the supremacy of the Canadian cheese trade. has been practicelly eliminated from Montreal shipments since the inauguration of the system of cargo inspection, which is maintained at that port and at ports in Great Britain under the direction of Mr. Ruddick.

As Mr. Ruddick points out, it is necessary to find out where the trouble arises, before remedy can be intelligently applied.

EDITORIAL NOTES

Here is something from the pen of one of our leading educators well worth considering: "Were manual training of a a practical sort provided for all the grades, and were the arithmetic, the language and the drawing brought into closer relations with it ; were nature study and school and home garden work made more general—the passage from the grammar school to the high school would not be less easy, but the passage from the school to the shop and the farm would be easier."

Conservation of Soil Moisture.

The conservation of soil moisture is an interesting and necessary subject for discussion.

The great problem in crop production, is how to supply moisture in adequate quantity, and at the right time to the growing crop. Where there are no irrigation projects upon which one can depend for soil moisture in time of drought, he must therefore turn to the regulation and conservation of the natural precipitation.

If a man works his soil in such a way that it is in the best possible condition to receive and hold a limited raibfall, he not only has largely solved the problem of moisture, but even the problem of maintenance of fertility. It is the question of how to increase the water holding capacity of the soil that will be touched upon.

Under drainage is the most efficient means of improving a soil in which the water table is so close to the surface that the soil is too wet for farm crops. Deep plowing, harrowing cultivating and other tillage operations also do much to deepen the soil, and during dry weather to increase its water holding capacity. The more a soil is pulverized, and the greater depth to which it is loosened, the more water it will hold and further, the loosening of the surface of soils, gives the water freer opportunity to soak into the soil, and thus moisten the land to as great a depth as possible. Fall plowing will leave the soil loose so that it will absorb the winter rains. If the surface is left hard and compact much of the water will run off and thus be lost. The fall plowing with subsoiling will loosen the soil from four to fifteen inches and this enables it ti retain a majority of the water that falls upon it as rain or snow. This is especially true of heavy clay soils.

The addition of humus to the soil in the form of farm manure, muck or a green manure has a very marked influence on its ability to hold water. This can be plainly shown by a table from "Hilgard's Soils" in which he gives the water holding capacity of soils. The table is as follows :

Sharp sand holds ...25 p.c. of water
Clay soil holds ...40 p.c. of water
Heavy clay holds ...61 p.c. of water
Loam holds ....57 p.c. of water
Garden loam holds ...89 p.c. of water
Humus holds ... ... 181 p.c. of water

Thus it can be seen that humus holds approximately twice as much moisture as garden loam, three times that of heavy clay loam and seven times that of sand. How would not a little of this then, added to the soil, increase its capacity to hold water.

It is, however, not necessary to know how to accumulate water in the soil, but also how to retain it or prevent its loss. We often hear of the film-water amounting to from one to one and one half inches, being lost by evaporation. This can be almost wholly prevented by using mulches.

The most effective and practicable mulches are coarse hay, straw and farm manures, not only because they are easy to apply, but because of the humus which they add to the soil. The most practical mulch in growing farm crops is the soil itself. This is obtained by stirring the surface of the soil with implements such as the harrow and cultivator. Stirring the soil spreads the soil grains so far apart that water cannot pass from one grain to another except very slowly, and the moisture cannot rise any further than the compact, firm soil which now is not on the surface but several inches below it.

These things have, however, to be studied and practiced, not after the drought has come but rather as security measure before it arrives.

Potato Blight.

THE KINDS OF BLIGHT.

There are in this country two diseases of potatoes which commonly go under the name of "potato blight". One is known as "early blight" (Alternaria solani) and the other as "late blight" (phytophthora infestand).

The ideal conditions for the development of this disease are damp, muggy weather, with a temperature of about 70 degrees.

The late blight seldom makes its appearance in the Maritime Provinces before the first of August, and may appear at any time from then on to the end of the season. When the weather conditions are favorable, it is very rapid in development and very destructive.

A healthy looking potato field may be destroyed under its attack in the course of only a few days. It begins near the ground and rapidly works upward on the plant. Fields affected emit a peculiar, characteristic odor.

EARLY BLIGHT.

Early blight does not require as favorable conditions for its development as are necessary for late blight. It is a disease which may begin to affect the plants early in June or any time thereafter. It is usually most destructive in July and August The desease appears as brownish spots on the leaves. It usually attacks the ends of the leaves, where the moisture evaporates last, more than it does the other parts of the leaf surface. It is much slower in action than late blight. Weak plants suffer more from its attacks than vigorous ones. The injury it does is undoubtedly greater on late varities and on late plantings of early varieties than it is on early plantings of late varieties. The latter are often nearly mature by the time this desease becomes serious.

SPRAYING FOR EARLY BLIGHT ON EARLY PLANTINGS OF EARLY VARITIES.

The indications are that it will not pay to spray with Bordeaux mixture on early plantings of early varieties, but this has not yet been definite proven. Wherever it is to be done, it must begin when the plants are small—about eight inches high, and continue about every ten days, until about ten per cent. of the leaf surface is affected with disease, after which it is not likely to be any longer sufficiently effective to be worth while. In very rainy weather, the applications should be sufficiently more frequent to keep the leaf surface well covered with a coating of the Bordeaux mixture. When the spraying is begun while the plants are small, an application of twenty-five to thirty-five gallons of Bordeaux mixture per acre will usually be sufficient the first time. The second time the application should be increased to about fifty gallons per acre, and the third and subsequent apulications should be at the rate of sixty to seventy-five gallons per acre. Thorough spraying under a pressure of about seventy-five pounds, from a nozzle of the Vermorel type, is essential to success. One nozzle per row is sufficient for the first application, after which two nozzles per row will be needed.

SPRAYING FPR EARLY BLIGHT ON LATE XARITIES OF POTATOES.

Spraying for early blight on late varities has proved profitable at the Experiment Stations. For late varieties the first application may be delayed until the earliest varieties in the neighborhood show signs of the presence of this disease, when the spraying should be no longer delayed. Since the plants are usually of fair size by this time, the first application should be made with two nozzles per row, using from sixty to seventy-five gallons per acre, and the same for all subsequent applications. The frequency of spraying should be about every ten days, except in rainy weather, when it should be made more frequently, as was above recommended for early varieties.

HOW TO MAKE BORDEAUX MIXTURE.

The strength of Bordeaux mixture to use in spraying for potato blight is : 5 pounds of bluestone (also known as copper sulphate and blue vitriol) and 5 pounds of the best grade of stone lime to 50 gallons of water. The bluestone can be dissolved most readily by hanging it near the top of the water. The lime must be fresh, and of the best grade, aod should slake readily. It should be slaked several hours or more before it is wanted. When ready to apply the Bordeaux mixture, the bluestone containing the five pounds of bluestone, should be diluted to about thirty-five gallons. The milk of lime, containing the original five pounds of stone lime, should then be diluted to about fifteen gallons, and poured into the barrel with the diluted bluestooe solution. The resulting product is the Bordeaux mixture, ready for use. Any poison needed for potato beetles may then be added, thus spraying for blight and the potato bugs at the same time.

TESTS FOR BORDEAUX MIXTURE.

If the lime used is of low grade, there is danger of burning of the foliage from the Bordeaux mixture. A good test is to hold the point of a knife blade in the mixture for a short time. If cupper collects on the blade, more lime must be added to prevent injury.

A good chemical test is by means of potassium ferrocyanide. Dissolve an ounce in a small quantity of water. To test the Bordeaux mixture, take out a dipper-full after stirring well, and let settle for a few minutes. Then pour into it a few drops of the potassium ferrocyanide solution. If a rust-like sediment forms, more lime must be added. If no sediment forms, and there is only a slight yellow discoloration, sufficient lime is present. Potassium ferrocyanide is a very deadly poison.

STOCK SOLUTIONS FOR BORDEAUX MIXTURE.

Stock solutions of bluestone and lime save much trouble when Bordeaux mixture is being used on a large scale. A stock solution of bluestone may be prepared by dissolving in a keg or earthen jar all of the bluestone that the water will hold. A supply must be left hanging in the top of the water at all times in this method. A gallon of such a solution will contain three pounds of bluestone, and the amount taken out can be adjusted to the number of pounds of bluestone desired.

A stock solution of lime, may be prepared by slaking a certain number of pounds of lime and adding enough water so that each gallon will contain two pounds of lime. The milk of lime must be well stirred before taking any out, or there will be danger of not getting enough lime into the Bordeaux mixture to keep it from burning the foliage.

CLOSING CHARGE.

Throughout all this work, it must be remembered that high pressure, thorough application, constant agitation and careful straining are essential to success.

Provide Against Short Pastures.

An abundance of pasture grass such as now prevails is not at all unlikely to be available continuously throughout the Summer. With rare exceptations such has not been the case in past years, and it is not at all probable that it will be this year. A cow to do her best requires abundant forage. She may exist, and possibly keep in fair condition on medium or scanty pasture, but sustained production with attendant profits is not possible under such conditions. The farmer of foresight has already provided, or will now make provision, for any exigencies relative to the feed supply that may occur.

Oats and other cereal crops alsown may be used to any extent required as a soiling crop during their respective seasons. The pinch, as a rule, is not felt, however, until after these crops have reached that degree of maturity where they are unsuitable for soiling. It is a commendable practice to seed a small area at about this time to oats and peas, which may be used if required after the main crop is past the proper stage for soiling purposes. This crop if not required may be harvested in the usual way for grain. The pinch usually comes during the first three weeks of July. Unless alfalfa is available, oats and peas as a soiling crop should be on hand to tide over this period.

Even a later sowing, in some cases, would be advisable. Corn is of little benefit until it has reached the tasseling stage, and until then the late sowing of oats and peas will prove most valuable to maintain the milk flow while the corn is becoming ready.

Those who wish a crop that may be pastured should resort to the one-year pasture mixture recommended by Prof. C. A. Zavitz, of the Ontario Agricultural College, which is Siberian pats, 51 pounds; Early Amber suger cane, 30 pounps; common red clover, seven pounds; a total of 88 pounds of seed per acre. This crop is ready for pasturing in from five to six weeks' time and has proven a valuable pasture mixture in the experimental work at the college.

Cement Floors in Cow Barns

Where cow stables are cemented right up to the manger, there is constant trouble saving the knees of the cattle and in keeping bedding under them. We have until recently used wood as flooring, but when installing cement in our cow byre I decided to leace a trench four inches deep and 20 inches wide where the front feet of the cows would come. This trench we filled with blue clay, which soon packed very solid. It acts as one of the best aids in keeping bedding under the fore feet and in saving the cows from sore knees.

With this equipment in the stalls this past winter, we have had no trouble nor do we anticipate any from the cuases mentioned above. The men who put in the cement work were very loath to do as I requested, as they had never seen the like before. The plan now has the approval of all who have seen it, and no money would induce me to have this trench filled with cement, which, however, could easily be done at any time if one so desired.

Another advantage of the clay is that it is warmer than cement and it would appear that cement will ere long be universally in cow byres. Those intending to put in cement floors under their cattle should certainly give consideration to this point of having clay under the front feet of the cattle.—J. H. Caldwell.

HORTICULTURE

Box Packing in the Annapolis Valley.

Editor The Maritime Farmer :—

The rapid development of Nova Scotia's export trade in apples warrants greater attention being paid in that province to box packing. British Columbia has made her reputation in fruits through adopting the box packing and those States of the Union that employ this means of packing are the ones that we hear so much about in regard to prices. Nova Scotia's reputation for the production of high quality apples was made long ago, but she can obtain a still greater one by the use of the box in the packing of her best grades. The fact that last year some Nova Scotia apples were sold in the Old Country at $6.00 a box shows the possibilities. This figure, of course, is exceptional; but it is not exceptional for apples in boxes to sell for twice as much as the same bulk in barrels.

Our British Columbia friends, who are the best self-advertisers on the continent, continually say that the East will be barrelling apules for years to come. In a letter that I received recently from a prominent fruit grower ,n the Okanagan Valley, the statement was made that Nova Scotia will not adopt the box package because "she can't get out of the rut." If this is so, Annapolis Valley growers should wake up. But are they in a rut—are they asleep? Men who know, say "No"; and rightly so. Nova Scotia was in the apple business many years before British Columbia was thought of as a fruit country and she commenced operations with the only package then known for the purpose, the barrel; and she made her great reputation through it's use. Now that conditions have changed and that the demand is gradually calling for a more convenient package, she is alive to the need. Box packing is not a new thing in Nova Scotia, but its use has not yet reached the stage that it has in British Columbia where the fruit business was started at a time when the box had proved it's worth in the frdit industry of the western states. In Ontario the box is being used more and more each year and some of the Co-operative Fruit Growers' Associations are using it exclusively.

While the near future will see the box in more general use, it never will take the place of the barrel for all purposes. Only No. 1, and fancy apples should be placed in boxes and all other marketable grades in barrels. The idea that is being established and that must be maintained in the minds of British buyers and consumers is first quality, always first quality and only first quality in boxes. This should form the basis of our export commerce in box fruit. There is no place for doubt in quality in contemplating the sale or purchase of a box of apples. Let the barrel be regarded with suspicion if we must (and even this bad business) but the box should be established as the package for quality that is guaranteed. This can be done only by the growers and packers themselves. Government inspection may and does have its influence but it is the man behind the goods and who packs it that is responsible for the good or the bad that is in it. It is evident, therefore, that the development of the boxed-fruit trade of Nova Scotia, of of any province, depends upon absolute honesty. Couple this with well-grown fruit, properly selected and evenly graded, and the possibilities of box-fruit are almost unlimited. Now that Nova Scotia fruit men appreciate the situation they should give box packing greater attention during the coming season. They grow the right kind of apples—in variety, in color, in quality, in everything—and they have the business ability and skill to make the most of them. A more universal adoption of the box packing will help to do it.

A. B. CUTTING.

Prince Edward Island's Possibilities for Culture of Small Fruit and Vegetables.

Prince Edward Island, though a small province does its farming, generally speaking, on the large. Intensive farming in the true sense has not been practised to any considerable extent. This is not because of any lack of adaptation, but because of the comparative markets and the further lack of proper facilities for reaching more distant ones. Lack of express arrangements, iced cars and too frequent handlings are serious defects in our transportation conditions. Market gardening, therefore, with the exception of what little may be needed to supply the limited demand of the small towns is not followed, except for the farmer's table. So limited are the markets that even with the small attention paid to this aspect of agriculture, a glutted market is the common condition in the season of fruit and vegitables; and the prices are often of the lowest.

Oats, wheat and potatoes are the Prince Edward Island staples, and these wholly occupy the farmers thoughts and attention. He cannot seem adapt himself to a small acreage. A hundred acres, and olten double this amount, is as little as he cares, to bother with. Here he uses his gang plows, combination seeders, harvesters and other complicate machinery. This is his ideal of farming. A few acres in fruits and vegetables, largely cultivated with hand tools, would strike him as a serious drop in the dignity of the profession. This would seem to be a more fitting occupation or diversion, by way of pastime, to the man who had who had retired from active life. These ideas are the outcome of generations of usage—a usage that has largely been made necessary because of market conditions.

Notwithstanding the comparative absence of intensive farming as represented in the cultivation of vegetables and small fruits, it is doubtful if there is any part of the Dominion where the natural conditions are more favorable than here. The island itself is often spoken of as "the garden province." This is not because of its diminutive size, but on account of its uniform fertility. The land is smooth, gently undulating, free from rocks and swamps and unencumbered by small stones. The soil is a light sandy loam, warm and wonderful easy of cultivation. The natural drainage is about perfect The summers are bright and warm with generally cool nights, while the rains are, as a rule, frequent, but not excessive. The Autumn is mild and open to a degree not experienced on the mainland. Insects and diseases are much less numerous and destructive than in other places. The season being a little later than most mainland sections. Prince Edward Island products are matured when outside markets are clean, thus removing competition. It will be seen therefore, that these conditions, both of soil and climate, are about perfect for the purpose of the small fruit and vegetable grower.

This claim is borne out by the actual results. Anyone attending our provincial exhibition or the Charlottetown matket will be surprised at the excellence and variety of the stuff grown. The small fruits, such as cherries, strawberries, raspberries, blackberries, currants and gooseberries do amazingly well. I believe it is a law of nature that the higher the latitude where fruit will come to full maturity, the better will be its quality. There seems to be something in this alternating of cool nights with bright warm days to give firmness and flavor and luciousness to fruits and vegetables grown under these conditions. These qualities are noticeable to a marked degree in the fruits and vegetables grown in Prince Edward Island; but the great need is a market.

Charlottetown, the capital, has about 12,000 inhabitants, It is not an industrial centre, but is largely a city of homes where people have some leisure, and many of whom possess gardens of their own. The largest cities in the Maritime Provinces have but 50,000 inhabitants, and they (St. John and Halifax) are at present a day's journey distant. These, and other disadvantages, make even these limited centres impossible to the Prince Edward Island grower. But the cities of the Maritime Provinces are growing in size and increasing in number, and no doubt with their growth will come a corresponding improvement in transportation facilities. If there were in the Maritime Provinces a city of say, the size of Boston within reasonable distance, it would simply revolutionize this industry in Prince Edward Island. A number of our Maritime cities are bound to grow to large industrial centres in the not distant future and when this takes place it will transform agricultural methods on Prince Edward Island.

When these conditions prevail it will not only change our methods of agriculture, but will be of great advantage both economically and politically. When the island is transformed into a province of vegetable and fruit gardens, rather than one of oat and wheat fields, the average farm would be large enough at 25 acres. This would make possible an increase in the population by about 400 per cent. In other words, instead of having 103,000 population, with no vacant lands, we would have room for about 400,000 people by thus reducing the acreage of the farm. Such an increase would tend to attract manufacturing, and thus give corresponding growth to our towns and cities. It is easy to see that such an increase would at least help to restore our lost representation at Ottawa, and give us such an importance as to bring the tunnel, now a fond hope, in the realm of practical certainty. In the light of these facts a fruit and vegetable garden assumes a great and new significance.

Something could even now be done by a little improvement in transportation facilities, and a little more business enterprise. To illustrate we may refer to the Kentish cherry orchards which everywhere obtain here. The various varieties of sweet cherries do exceedingly well in different parts of Nova Scotia and are about the only ones cultivated. These cherries are largely sold in St. John and Halifax, and are put on the market about the middle of July. Their season is, however, short and frequently they fail almost entirely. Cherries of all kinds throughout New Brunswick, for some reason, are made conspicuous by their absence. On Prince Edward Island, however, the Kentish cherry is grown with the greatest of ease, and in splendid abundance. There is scarcely a farm, large or small, between East Point and North Cape, that has not a cherry orchard of some description. The crop very seldom fails; in good years, the yield is enormous, and the local demand is comparatively limited. These cherries come into maturity about a month later than the Nova Scotia crop, and being equally suitable for preserving as for table fruit, it will

Was Troubled With Dyspepsia.

For Years Could Get No Relief Until She Tried

Burdock Blood Bitters.

Can Eat Anything Now.

Mrs. Herman Dickenson, Benton, N.B., writes: "I have used Burdock Blood Bitters and find that few medicines can give such relief in dyspepsia and stomach troubles. I was troubled for a number of years with dyspepsia and could get no relief until I tried Burdock Blood Bitters. I took three bottles and became cured and I can now eat anything without it hurting me. I will highly recommend it to all who are troubled with stomach trouble."

Burdock Blood Bitters has an established reputation, extending over 34 years, as a specific for Dyspepsia in all its forms, and all diseases arising from this cause.

For sale by all dealers.

Manufactured only by The T. Milburn Co., Limited, Toronto. Ont.

CreamSeparators At Half Price.

We wish all who need a Cream Separator to read the following letters, which speak for themselves.

Locksley, Ont., May 11, '07. Windsor Supply Co., Gentlemen: Please find 30c for which send me India rubber rings for No 2 Windsor Cream Separator. My Separator has been in use for four years, and still gives as good satisfaction as it did the first day we used it. Yours truly, T. Hamilton.

Thornhill, Man., July 27, 1909. The Windsor Suppy Co. Dear Sirs:—You will wonder if I ever received my Separator. I wanted to give it a good trial before I wrote you. I find it **does good work.** We like it real well I am, yours truly, Mrs. S White.

We receive scores of letters like the above from all parts of the Dominion Send for circular, giving full particulars by return mail. All orders filled the day received. Our prices are as follows :—

No. 0. cap. 100 lbs. milk per hour.....$10.00
No. 1 cap. 210 lbs. milk per hour..... 25.00
No. 2 cap 340 lbs. milk per hour..... 30 00

N. B.—We have in stock a few No. 1 and No. 2 Separators, which have been used only for a short time, and then exchanged for larger machines These we are selling, while they last, at the following very low prices, for cash with order only :—No. 1, $14 00; No. 2, $16 00 These machines are all practically as good as new, and all will do perfect work, skimming as close as any separator you can buy at any price, but of course they do not look like new, nor can we sell them as new machines. We advise those who wish a first-class Cream Separator almost for a song, to order one of these. Times are hard don't be humbugged by agents into paying big prices any more for Cream Separators. Address,

Windsor Supply Co., Windsor, Ont.

Dates to Remember.

The Greatest Fruit Show ever held in New Brunswick, St. John, N. B., November, 1910.

Had a Bad Cough

FOR A NUMBER OF YEARS. WAS AFRAID IT WOULD TURN INTO

Consumption.

Too much stress cannot be laid on the fact that when a person catches cold it must be attended to immediately or serious results may follow.

Thousands have filled a consumptive grave through neglect.

Never Neglect a Cough or Cold, it can have but one result. It leaves the throat or lungs, or both, affected.

Afraid of Consumption.

Mrs. A. E. Brown, Ottawa, Ont., writes:—"I have had a very bad cough every winter for a number of years which I was afraid would turn into consumption. I tried a great many remedies but only received temporary relief until I got a bottle of Dr. Wood's Norway Pine Syrup and after taking two bottles my cough was cured. I am never without a bottle of Norway Pine Syrup."

Dr. Wood's Norway Pine Syrup is the medicine you need. It strikes at the foundation of all throat and lung complaints, relieving or curing all Coughs, Colds, Bronchitis, Asthma, Croup, Sore Throat, etc., and preventing Pneumonia and Consumption.

So great has been the success of this wonderful remedy, it is only natural that numerous persons have tried to imitate it. Don't be imposed upon by taking anything but "Dr. Wood's." Put up in a yellow wrapper; three pine trees the trade mark; price 25 cents.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

It Sticks

A sharp shower, and the afternoon's work spraying the potato patch with Paris Green is lost. Not so with

"VANCO"

Lead Arsenate

Even after two or three rains enough will be left to keep down the bugs.

It is just the same when you are spraying fruit trees for Codling Moth or any other insects—"VANCO" Lead Arsenate sticks best and kills surest.

"VANCO" Lead Arsenate contains 15% to 16% Arsenic Oxide and only 40% moisture average.

It sprays easily and never burns the foliage.

10c. to 13c. per lb. according to quantity.

"VANCO" Spray Chemicals are prepared in Canada, in our laboratories, by practical men. Government analysis and practical tests have proved them high in quality. Yet they are lowest in price.

be seen that they should have a splendid demand in the cities of the adjoining provinces. But as a matter of fact, I have never heard of a shipment of these cherries being made, and when the local demand is supplied the balance of the crop is either given away or left for the birds or perchance, to rot upon the ground. It will readily be seen that the owner of a cherry orchard at the present time is at a distinct disadvantage, since any neighbors that may be invited to share the bounty of his crop invariably share the bounty of his table.

Since this cherry is firm and a good shipper, it seems strange that some attempt is not made to market them outside of the island. In the vicinity of Summerside or Charlottetown, cherries could be picked in the morning and arrive in St. John or Halifax in time for delivery the same evening, under present arrangements. At greater distances from these centres, they would require to be picked the evening before, but, in any case, they should reach their destination in a prime condition. As they come on the market when there is generally a scarcity of small fruit, they should meet a ready sale at good prices. Here it would seem is where a little enterprise might make profitable a wasted asset.—Rev. F. A. Wrightman, in Canadian Horticulturist.

Some Factors in the Control of Moisture in Orchard Soils.

I shall briefly state some of the more important conclusions from researches that have been made at Ottawa. For the figures and details, consult the publications of the Dominion Experimental Farms.

1. The growth of rye, oats and buckwheat as cover crops in the orchard has always resulted in the removal of larger amount of soil moisture than those lost by the growth of one of the legumes—clover, hairy vetch, soya beans, etc. The draft made by the cereals upon the stores of soil moisture is greatest between May 1st and July 15th—a period when it is required for the use of the orchard trees. We have found that the equivalent of approximately ten inches of rain may be lost in this period from soil carrying a grain crop, over and above that lost from a cultivated soil.

It seems more than probable that the smaller amount of water lost from the soil carrying the cover crop— clover, vetch, etc.—as compared with that carrying a grain crop may be in part accounted for by the more perfect shade from the sun and protection from the wind afforded by the former crops.

2. More moisture may be conserved by sowing the cover crops—hairy vetch, soya beans, horse beans—in drills and cultivation between the rows from time to time throughout the summer, than by sowing these earth mulch is more effective than crops broadcast. In other words, the the shade offered by the crops in conserving moisture. This method of growing cover crops seems to offer a means of furnishing material for enrichment of the soil without making any excessive demand on the soil moisture supply—and hence may prove valuable for adoption in districts that are subject to drought in the late Summer. It is quite possible for a soil to become so dry in the Autumn months that the fruit ripens prematurely. On such soils, of course, the ordinary cover crop, sown in July, may do more harm than good.

3. There appears to be little difference between the moisture content of soils constantly cultivated throughout the Summer and that of soil under a thick mulch of straw. Ten to twelve inches of straw seems to be very effective in conserving moisture to such a method are cost of material, application and removal—for the but the objections that may be urged latter would be necessary if there were danger of the trees continuing their growth into the late Autumn—and the probability that the straw mulch would cause a surface development of the root system, resulting in injury to the trees from Winter killing.

4. Undisturbed fallow land readily dries out and further, may be taken possession of by weeds which serve to increase the loss of moisture. We have instances in which such land has been found to dry out to the same extent as land in sod.

The desirability of immediate cultivation after plowing an orchard has been shown, if soil moisture is to be conserved. A period of three or four days with the upturned soil as left by the plow may very seriously diminish the soil's store of water.

FROST & WOOD No. 8 MOWER

2 HAY-MAKERS

THEY WORK WELL TOGETHER

An ideal combination for getting in your crop of grass. Our **No. 8 Mower** with its strong, substantial build, its accurate, clean-cutting power and ease of operation, is a real money-saver and profit-earner for thousands of farmers at every point in the Dominion. It is strong, durable, needs few repairs. It works day in and day out, proving the stalwart honesty and mechanical excellence put into every gear and wheel, knife and shaft, cutter-bar and pitman.

But there's the other tool—can't get along without that—the **Tiger Hay-Rake.** It's all steel, except tooth-rail and shafts, which makes it proof against hard work, rain and exposure. **A Tiger Rake** is exceptionally durable. It does such clean work, too. The spring teeth have just enough elasticity, and are curved so as to pick up grass easily and evenly. It's an easy rake to handle for horse and driver. It can be dumped by foot or hand. The fall of the teeth after dumping is eased by a strong spring that prevents much of that disagreeable jar so evident in cheap rakes.

We can't tell you here the scores of good points about these hay-makers. Send for our catalog "B," and "Farmer's Ready Reckoner." Both books are **free,** and answer your questions. Ask our local agent to show you our farm implements. He'll gladly do it.

DAIRYING.

C. W. McDougall, Dairy Inspector, staff Contributor.

Milk Production.

During the last few years considerable data has been gathered in our experimental work here with dairy cows which indicate that it is possible in another way to increase the percentage of fat to an abnormal degree for a short time and probably to a less degree for a longer time.

The rule seems to be that when the ration of a cow is insufficient to support her milk production, and she draws on the fat stored in her body, that the per cent of fat in the milk is increased. The reverse seems to be true as well; that is, when she is gaining in weight or storing fat on the body there is a tendency for the per cent of fat in the milk to be lower.

This increase of the per cent of fat in milk due to transfer of fat from the body to the milk, is most marked immediately after calving. In the course of one of our investigations a Holstein heifer calved in as fat condition as was possible to get her by continuous heavy feeding from birth. Another heifer of practically the same age and breeding was fed from birth until she came in milk on a ration of skim-milk and hay, without any grain whatever. As a consequence she was decidedly thin at calf birth.

The milk of the heifer in good condition tested over 4 per cent at the start, while the milk from the one in thin condition tested about 3 per cent. The fat heifer declined in weight for several weeks and during this time continued to show a high per cent of fat. When her weight became stationary her per cent of fat declined until it was practically the same as the other. The thin heifer made no decline in weight for several weeks and showed no decline in the fat in her milk. Later she began to gain in live weight, she having been put on a liberal grain ration immediately after calving. Her per cent of fat increased slightly until the two became practically together.

Similar results have been obtained with two other pairs of heifers under the same treatment. The most marked example of how this works out is shown in the following:

A mature Jersey cow was fed a liberal ration for two months before calving in order to get her unusually fat. Immediately after the birth of the calf she was put on a ration that was sufficient only to maintain her body weight, according to the maintenance values as usually estimated. She was fed for thirty days on a ration of three and one-half pounds grain and seven pounds hay a day, which was estimated body maintenance. At the beginning she produced twenty-one pounds milk a day. During the thirty days the decline in milk was very slight. Indeed, at the end of the thirtieth day period she was producing nineteen and one-half pounds a day. During this time she lost 115 pounds in live weight. In the beginning she was smooth and excessively fat for a Jersey cow, but at the end of the thirty days she was decidedly thin and emaciated. Beginning with the twenty-eighth day it was observed that she was becoming weak and she staggered as she walked. On the twenty-ninth day she could scarcely get up when down, yet she produced nineteen and one-half pounds of milk. It was not considered safe to continue the test any longer, and her ration was increased to a normal amount. During the thirty days this cow produced milk continuously without any feed whatever to supply the nutrients.

It is evident that the solids in the milk must have been taken from the body and the decline of 115 pounds in weight shows this was the case. The average per cent of fat during the thirty days was 6.9; the normal test for this cow is slightly under 5 per cent. Within forty-eight hours after her feed was increased at the end of the thirty-day period the per cent of fat in the milk declined about 2 per cent.

Further and more extensive trials are necessary to fully prove this law and especially to determine its metes and bounds, but it is believed that these results are of great significance in a number of ways. In the first place it will mean that short periods are absolutely valueless in carrying on feeding trials with dairy cows. If a cow will produce milk for a month without having any food to furnish the necessary material, it is evident that the effect of any feed cannot be measured in a short period. In an experimental way it also has a bearing on methods of carrying out many lines of investigation, as, for example, the effect of feeds in the composition of milk, since here we will have to avoid the probability that milk fat taken from that stored in the body and secreted in the milk is of different composition from normal milk fat.

Another interesting question brought up by these experiments is its relation to the common method of carrying on seven-day tests of dairy cattle. It has been the subject of comment frequently by leading authorities that in recent years much higher fat percentages are secured in seven-day tests than was formerly the case.

The possibility of increasing the per cent of fat in milk for a period after calving by the means mentioned has apparently been used by those who are the most successful in making those phenomenal seven-day tests. A cow that will average 3.2 per cent of fat for the year, can with reasonable certainty be made to test 4 per cent or even higher for a week if properly handled.

The way it is done is to fatten the cow as much as possible before calving. Then after calving the animal is fed very moderately, and the test is begun within four or five days. Under these conditions the animal has insufficient feed to support the enormous milk and fat production. Since her body is loaded with fat, this fat is taken from the tissues and a large amount of it secreted in the milk.

As said before, a large amount of additional investigation will have to be carried on to establish the limitations of this principle and to make it possible to understand its full significance. The investigations under way in this line, it is hoped, will supply data that will make it possible to reach some definite conclusions. The material already at hand is sufficient and so consistent in every respect that in the opinion of the writer there is no doubt of the accuracy of the general proposition laid down.

Missouri Agricultural College.

Care of the Udder.

All domesticated animals are liable to suffer from "Mammitis," or inflammation of the udder. This disease is also known by the name of garget. The cow, however, is more likely to suffer than any other animal and from the importance of the lacteal secretion it is always more or less serious and if not looked after in early stages, it is likely to interfere very much with the usefulness of the animal in the production of milk. The disease is more likely to occur during the first month after calving because during this period the udder is usually in the height of its functional activity occasionally it is met with previous to calving.

CAUSES.

Mammitis is due to a variety of causes. In newly calved cows (especially in heavy milkers), we find a certain amount of inflammation in the udder due to the great activity of the gland, at that time, but it usually quickly subsides as soon as a portion of the milk is removed, which should be done regularly and repeated often enough to prevent the inflammatory action from increasing. Exposure to wet or cold, such as lying on the cold ground or exposure to draughts are predisposing clauses. Filthy and poorly ventilated stables will generate a miasma, which is liable to have an injurious effect on the udder.

Too much stimulating food is likely to set up a plethoric condition of the system which has a tendency to produce the disease and it is sometimes produced because of the presence of tubercular deposits in the udder. It may also be produced by mechanical causes such as contusions, wounds, injuries in milking or from blows from the head of the calf while sucking.

TREATMENT.

If taken in the early stages this disease usually yields readily to treatment. A good strong dose of purgative medicine such as a pound or two epsom salts should always be administered. Then heat and moisture should be applied to the udder in the form of fermentation

Farmer Agents Wanted

We want a farmer in every locality to act as our representative. No experience necessary. No financial obligations to be met before starting to draw your commission. All notes, etc., are looked after by us.

District representative will call and instruct. Every assistance given in making a sale. The **Empire Cream Separator** is the easiest to clean, easiest to turn, and easiest to sell of any separator on the market. A card or letter written us today will be attended to at once. Just now, between planting and harvest, you will have a breathing spell—why not make a few dollars? No loss of time from your farm work, no investment, no travel, and no fault finding after machine has been placed. No better proposition has ever been offered you. Write today.

The Empire Cream Separator Company of Canada, Limited
SUSSEX, New Brunswick.

Farmers Take Right Stand

Canadian farmers rightly insist that a cream separator which contains neither disks nor other contraptions, and yet produces twice the skimming force of common, complicated machines, must be most modern. They believe such a separator has made complicated machines out-of-date. This is common sense and explains why Canadian farmers are buying simple

Sharples Dairy Tubular Cream Separators

Dairy Tubular Bowl. Made right. No disks needed.

in preference to disk filled or other common, complicated machines. The illustration shows all there is to the Sharples Dairy Tubular bowl. It containsneither disks nor other contraptions, produces twice the skimming force, skims faster, skims twice as clean, wears a lifetime and is several times easier to clean than common separators.

The World's Best. The manufacture of Tubulars is one of Canada's leading industries. Sales easily exceed most, if not all, others combined. Probably replace more common separators than any one maker of such machines sells.

or poultices. A convenient method of doing this is to support the udder with a broad bandage brought up and secured over the loins, four holes having been cut in the bandage through which the teats will protrude. Then stuff cloths wrung out of hot water between the bandage and the udder, the cloths to be renewed as often as necessary to maintain heat and moisture in the parts. In thus poulticing the udder it is a good practice to remove wet cloths at night and replace with wool which has been heated by placing in a bread pan in the oven which will keep the parts warm over night, the poulticing to be repeated next day if necessary. Poultices often do more harm than good if allowed to become cold and sodden over night, but the heated wool will prevent any injurious reaction. This treatment combined with hand rubbing the parts freely and the application of a little oil will generally prove successful in the early stages. If one or more quarters of the udder are badly affected and are very hard and sore, and especially if matter has formed, the dairyman will generally consult his best interests by employing a competent veterinary surgeon. And even then there is a danger of the gland being more or less damaged and possibly destroyed. Not unfrequently the disease in such advanced stages, will prove fatal.

Garget in Cows.

Veterinarians and dairy farmers are full of trouble constantly in reference to garget. In some herds it amounts almost to an epidemic. Yet we wish to say this:

In the last twelve years, keeping from thirty to forty cows constantly, we have had but one case of garget and loss of a quarter. That case was with a 2-year-old heifer who developed a wonderful udder and we foolishly allowed it to go too long, without relieving the strain by milking before calving. Our exemption from garget and stopped teats we attribute very largely to the fact that each cow has a stall by herself and always a warm bed of clean straw or other bedding to lie upon. We must remember constantly that the udder is the seat of an enormous amount of blood circulation. It must always have a warm bed to come in contact with or else circulation will be checked and congestion and inflammation will set in.

It is for this reason that we so strongly urge dairymen never to allow their cows to stand on cold cement floors. We cannot know any too much about this wonderful machine, the cow, for she is the embodiment of the greatest of all mysteries, that of motherhood.—Hoard's Dairyman.

Dairy Notes.

Palatable and digestible food is necessary if the cow is to give a good flow of milk.

The winter calf is most profitable providing it is well cared for.

Remember that the winter calf can not do well on pastures alone this spring. It should have an allowance of grain.

It pays to keep stock, especially young stock, thrifty.

Co-operative breeding associations are the coming things. Cheapest methods of getting good stock.

The dairy cow would have to do a great deal of selecting and culling before she could get the proper man to care for her.

If man was half as good to the cows as he thinks he is, the production of fat per cow would be materially greater.

Magnet Cream Separator "Sanitary Strainer"

For STRAINING MILK. Patent No. 123484.

PRICE $1.00 COMPLETE.

Fits the MAGNET Tank or any pail of same size.

All milk strainers have failed to meet the requirements of Dairy Authorities except the cloth strainer, which can be washed clean.

The difficulty of holding the cloth on the top of the pail or tank has prevented the general adoption of the cloth strainer for the cream separator.

By a simple spring device (MAGNET PATENT), which circles the top of the tank and holds the cloth in position, this difficulty is overcome and the milk strained directly into the tank.

The advantages are :—

1st. Great convenience in straining the milk.

2nd. It retains the animal heat thus enabling more complete separation of butter fat from the milk.

3rd. Prevents dust or foreign matter from falling into the tank.

4th. Nothing to wash except the cloth.

5th. Time and labor saved. Adjust the spring over the cloth, holding it tight around the top of the tank, that is all.

6th. The only "Sanitary" Strainer known.

7th. It is simple, clean and will not wear out.

8th. The same MAGNET quality to the strainer as in the Cream Separator.

9th. Every MAGNET Tank should have one fitted on.

Fill in the coupon with name and address, enclose **one dollar** and strainer will be sent you prepaid. Money refunded if you do not find it the handiest article in your dairy.

Please send a MAGNET "SANITARY STRAINER," charges paid,

Enclosed please find $1.00 stamps of postal order. To ..... P. O. ..... Province .....

The Petrie Manufacturing Co., Limited

Vancouver, Calgary, Winnipeg, Hamilton, Montreal, St. John.

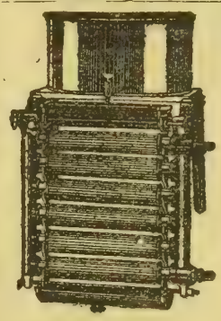
MADE IN CANADA.

Improved Automatic Compressed-Air Sprayer

Best Hand Sprayer made at the price. An absolute necessity for every farm and garden. Will repay its cost in one season, for potatoes alone. Saves time, labor and material. A boy can do the work. Will run automatically for 6 to 10 minutes. Fitted with our Cant Clog nozzle, it is unexcelled. Drop us a card for Descriptive Circular of our 1910 model and Spay Calendar.

CAVER BROS., Manufacturers,

9 Main Street, - - GALT, ONT.



Why Don't You Get A Bigger Price For Your Milk?

There are thousands of dairy-farmers using the Root Sanitary Milk Cooler and Aerator, and they are getting big prices for their milk simply because they can **guarantee** it absolutely pure and sweet and that it will **keep** sweet for at least 48 hours. Why don't you do the same when the price of a Root Cooler is so small? It really pays for itself in a few weeks. And don't forget that the Government authorities are testing the milk supplies all over Canada—stringent laws are now being considered. The

ROOT SANITARY MILK COOLER-AERATOR

will keep the milk sweet for 48 hours because it kills the animal heat quickly and cools the milk to the same temperature as cold running water. The water is admitted at the bottom, flows through the bottom tube, then from the water column into the second tube and so on until it reaches the top tube. Thus the cylinders are kept perfectly cold all the time, and as they are deeply corrugated the milk flows down them slowly, reaching the retaining pan thoroughly cooled and aerated. Cylinders are made of heavy copper, heavily coated with pure tin and guaranteed to stand heavy water pressure. Perfectly simple to operate—no complicated parts—a child can easily clean the whole machine in 5 minutes. Made in various sizes—will cool from 40 to 75 gallons an hour. Write us to-day for catalogue and prices—every dairyman should have a Root Cooler—it's a big money maker. Address:

W. A. Drummond & Co., 185 King St. E., Toronto

LIVE STOCK.

Feeding Calves for Veal.

About a year ago I wrote you a letter which appeared in the "Dairyman" on the subject of utilization of skimmilk and the cheau vealing of calves by its use. At that time little experimental knowledge was known on the subject outside of three or four experiment stations, notably that of Kansas under charge of Prof. D. H. Otis of the Kansas Experiment Station. At that time I had tried the practice on three or four calves with marked success.

The article to the Dairyman was largely copied in other agricultural papers. It aroused quite extensive experiments in many parts of the country, and I have been in receipt of many letters from persons who have tried the methods therein described. Nearly all were successful to a marked degree. The saving was from $10 to $12 and often more, each calf. This is a big saving in the dairy business. I encouraged the practice among the dairymen of my locality and watched results. I watched over 200 calves with which this method was used. I found but a very few failures, and in every case but one, was easily able to trace the cause of failure. In nearly every case it was overfeeding. In one large dairy "white scours" broke out, and of course the calves were not a success. The "dried blood food" remedy was not tried, or I presume they would have come out all right.

Where directions were carefully followed I did not learn of a single failure. Scours were almost unknown.

The method described was that of the Kansas Experiment Station, with a single change. It was as follows :

Calves were weaned at about twenty-four hours old. They were then fed about four quarts daily of the mother's milk. Most feeders fed but twice per day as most farmers do not care to take the time to feed three times. So far as I could learn those fed twice did as well as those fed oftener. This was continued for five to seven days. Then part of the new milk was removed and skimmilk substituted, fresh as it comes from the separator. At the same time a sort of gruel or porridge is prepared from white wheat middlings and corn meal, by putting two parts middlings to one of meal, (there are plenty of other compounds that do well) scalding or cooking so as to readily digest and a gill or so of this added to the milk. It must be thin enough to readily stir into the milk without lumps. About a week is used in changing gradually from new to skimmilk. The gruel and milk may be slowly increased until at three or four weeks the calf is fed eight quarts of milk per day.

At from two to three weeks old the calf should be taught to eat shelled corn. Most calves will take to it readily at about the time they will begin to nibble a little hay or oats. It should be put in a box in reach of the calf and a supply kept where he can have all he will eat, at least until he eats more than a quart per day. In teaching it may be necessary to put a little in the mouth holding up the mouth until he chews it. As soon as they get the taste they usually eat it readily and greedily. I have never known a case where feeding all the corn they would eat produced scours. Corn is preferable to meal for the reason the calf thoroughly masticates the corn before swallowing, while it will take the meal into the stomach without mastication and indigestion is liable to follow. Butterfat is a carbohydrate with protein added. A pound of corn worth two cents will go as far toward fattening the calf as a pound of butterfat worth thirty-nine cents or more. It takes a little longer for results with the skimmilk and corn than with the new milk for the reason that the digestive organs do not quite so soon master the corn, but being a much cheaper feed it pays to wait. I found instances where the calves put on over twenty pounds of flesh in seven days with the skimmilk and corn feed, between the age of four and five weeks. At the present price of veal it meant over twenty cents a day at a cost of not over two cents a day for corn. As a rule the calf will put on more flesh between six and eight weeks of age than in twice the time prior to five weeks. If the milk be fed half new and half skimmed for a week or so before marketing, it will be found a profitable thing to do. The added new milk at that age gives a finish and gloss to the calf that adds greatly to his marketability. Eight quarts of milk per day up to eight weeks is enough for a calf and too much for some.

There should be no set age for marketing calves. Sell them when fitted for market. Some calves are better fitted at six weeks than others under the same treatment will be at ten weeks. Keep them until ready to sell. This is in most markets before they reach 200 lbs. but as near to it as is safe, say from 175 to 190 lbs. Most markets object to cattle over 200 lbs. when offered for veals.

Two or three doses of ground blood meal prepared for use as cattle food, is almost an infallible cure for scours The Kansas Experiment Station has tested in many scores of cases, with universal favorite results.

In the foregoing method of feeding calves for veal or otherwise, it will be found that at eight weeks they have consumed about 800 lbs, of skimmilk, and about 75 cents worth of corn and about 75 cents worth of good new milk. If fattened on new milk it will in the same time have eaten about $12 to $14 or more worth of butterfat, making a difference of over $10 expenses in the feed cost of vealing a calf, if kept until nearly 200 lbs. weight. In a large herd of veals this is a matter worth looking after. C. L. PECK, Pennsylvannia. in Hoard's Dairyman.

Profitable Feeding of Export Cattle.

In order to finish export cattle so as to have them command such a price as will be in keeping with the cost of production, with the further cost of carriage to a distant market, and the rick incurred, it is absolutely necessary to have the right sort to start with. Neither mongrel-breds nor steers in which is a mixture of dairy-breed blood can ne made to yield any profit. The possible margin of direct gain is too small to admit of taking chances in handling an inferior class, which in ninety-nine cases out of a hundred will fail to leave a balance on the right side of the account. ffiK .

Having secured good cattle, bred along beef-making lines, the next consideration will be as to the age at which the finishing period should begin. The proper reply to that query is that much depends upon circumstances. With abundance of grass at little or no cost, it will be found more profitable to delay the finishing until three or four years old. Beyond that age, steers become in appearance too much like oxen to win attention in the sale yards.

Where good cattle are raised, and finished without changing ownership, on high-priced land, it will be found more profitable to reach the market at an earlier age. Thirty to thirty-six months should in such cases be the limit. Indeed, as the lank increases in value, so must baby beef-making be more closely considered, but that does not concern us now, as it is the export trade which we are discussing: i

To command the top price in British markets, it is the thick-fleshed, well bred cattle we must send across the sea. It is in the high finish that the largest profit is always found, and no country discriminates more in favor of good beef cattle than do the British Isles. M

While feeding to a high finish is so certain to bring satisfactory results at the latter end, we must not forget that in getting that finish we may "pay too dear for our whistle." It is comparatively easy to get thick flesh on our cattle if we have abundance of the right kinds of feed and we keep cost out of our reckoning. To get the high finish at the least cost requires careful consideration and close attention to ways and means.

In Ontario we have concluded that 100 pounds live weight can be secured in field feeding, with plenty of grass and other forage, at one-fourth the cost of getting an equal weight on in stall-finishing. The lesson to be learned is that all the weight and flesh possible should be got in the field and so reduce the heavy stable-feeding to the shortest possible period of time. i

With cheapness of production kept in view we have in recent years started the growing of rape for fall feeding. Then when pastures are usually at their worst, the succulent feed provided by the rape field, together with the dried-up grass, or, if such grass is not in reach, then hay fed in racks, not only prevents a falling off of flesh, but causes a rapid and very cheaply got increase of flesh, of bloom and of weight.

Having for several recent years experimented along that line, perhaps it may be interesting to state of the results.

1 mo. heavy stall-feeding .. 54.00

1905.

Aug. 6--9 steers, 1180 lbs-, cost $435.00
1 mo. grass and 2 mo. rape . 54.00

Total cost $543.00

Dec. 7—Sold averaging 1453 pounds at 5 cents, $654.00.

Then $654.00 less cost, 543.00, and freight to Toronto, $11.30, left to profit account, $100.00.

Cost of grain per 100 pounds, $4.40.

Percentage of interest on investment, 4 months, 70 per cent.

1906.

Sept 1--10 cattle, 1195 lbs., at $4.25..... ....$507.25

Total cost $699.00

Dec. 11—Sold, averaging 1378 pounds at $6.00, $862.80.

Then $826.80, less cost, $699.00, equals $127.80 profit.

Cost of grain per 100 uounds, $7.80.

Percentage of interest on investment. 83 days, 97 per cent.

It will be noticed that in each case mentioned, heavy feeding is stall during the short finishing period was practiced. The daily ration to each animal was one bushel Swede turnips, chaffed oat sheaves and clover hay. Some whole hay, 8 lbs., ground grains, and 4 pounds oil cake.

And I can tell you, Salt plays a very important part in butter making.

Give me good cows and Windsor Butter Salt, and I will win the prize every time.

At the big fairs for years, practically all of the prize winning butter makers have used it.

Used in Canada for over half a century —used in every corner of the world where people suffer from Constipation and its resulting troubles—

Dr. Morse's Indian Root Pills,

stand higher in public estimation than any others, and their ever-increasing sales prove their merit. Physicians prescribe them.

25c. a box.

EUREKA Glass Tank Sprayer

Solution tank is a quart Crown glass jar. If broken, it can be easily replaced for a few cents. Solution tubes are brass. None of the liquid used can be drawn back into the pump chamber, thus the chamber and valves are uninjured. This is the easiest operated and the most effective small sprayer on the market. Inquire of your hardware dealer. Write for our complete catalogue of Sprayers and Garden Tools.

THE EUREKA PLANTER CO. LIMITED
Woodstock - Ont. 6

Perfect Equipments for Barns.

The Louden Junior and the Louden Sling Carriers are the best and most reliable Carriers manufactured in Canada. Note in the Louden Junior Carrier how compact it is, and see how the wide flaring mouth insures the safe locking of the fork pully.

We make 13 different Hay Carriers. For particulars re prices, etc., write to

Louden Machinery Co., Guelph, Ont.

PILES CURED at HOME by New Absorption Method

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment ; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309, Windsor, Ont.

Chamberlain's Cough Remedy is sold on a guarantee that if you are not satisfied after using two-thirds of a bottle according to directions, your money will be refunded. It is up to you to try. Sold by all dealers.

The advantage of rapid gain in flesh and weight can readily be understood when we consider the little or no increase of weight of frame or offal, while the extra gain os practically all flesh and fat. To insure our getting the most profit in feeding export bullocks, we must aim at getting all the possible cheap grain in the field, especially when the time for stalling is drawing near, and then safely rush the finishing, in as short a time as will be found necessary to get the thick, solid fleshing which will stand the shipping, by rail and on sea.

When export cattle are carried on feed through the winter for spring shipment, it would be found more profitable to give them cheap bulky food during the first three months, and afterwards increase the grain and cake gradually aiming to have them on full feed the last two months. Swede turnips, with straw or hay, will keep the fall rape-fed bullocks going on nicely the first part of winter, with no grain, though a little good bran will be found benifical.

The direct cash profit may not as a rule figure out large, yet it is in the indirect results that the greatest gain will be found. When we consider that of the nutriment or plant food contained in what is fed to animals, their system abstract but less than 20 per cent., leaving over 80 per cent. voided in dung and urine to go back to the land, we realize what indirect profit can be got from feeding what we grow in our stables. We get full market values for the whole feed used with a margin of cash profit besides and only part with one-fifth of the plant food contained in all that is fed. The remaining four-fifths going back to the land, maintains and restores fertility to the soil, making our fields more and more productive as the years go by. Such should be the aim of all progressive farmers nowadays. Keep the soil well stored with available plant food, by the regular application of manure from well-fed export cattle, and crops will become more certain and full average yields may be confidently expected. The feeding of cattle must always occupy a prominent place in a grain-growing country, as the full-finishing of the animals means the feeding of the soil at the same time and continuous full production will be the outcome.

To have export cattle which are fed in stalls for a time ship satisfactorily, a run out to water for 30 to 60 minutes daily is necessary. Fresh water, at will, daily and a constant supply of salt are details which tend to make or mar and to which profit or loss may often be traced.—Jno. Campbell. Woodville.

Notes

A system perfect in every part, regular and methodical must be employed in making butter or everything will go wrong and in inferior product be turned out.

A cow in milk that will not consume a large amount of feed or show that she has not a good appetite, should be discarded from the dairy.

If there are cows in the dairy that suck themselves, that leak their milk or are troublesome to milk, make them ready for the butchers as soon as possible.

Do not overstimulate a cow in order to secure phenomenal results. It does not pay, because the cost of such development is greater than the profit and it injures the cow.

FREE SAMPLE CULVERT To FARMERS

Say you are interested, and we will gladly send you **Free** and postpaid a sample of the only **Practical** culvert and a handsomely illustrated book telling all about it. For drainage, road-repair, and a score of farm-uses there is no culvert so economical as this. Made of heavy **Billet Iron**; curved cold into half-sections. Then deeply corrugated---makes it five times stronger than smooth-surfaced pipe. Heavily galvanized with lead and zinc to make it proof against rust, dampness, decay, corrosion. Will outlast any other material.

LEARN ALL ABOUT THE MOST PRACTICAL and DURABLE CULVERT

PEDLAR NESTABLE GALVANIZED CULVERT

These pictures show how easily and quickly you can lay **Pedlar Culvert**. Comes nested, half-section within half-section---saving freight and cartage. Triple-thick **Flat** flange locking ribs on each side are clamped together by a simple tool---no bolts nor rivets needed. Joints are broken---**only** culvert you can do that with. Ends interlap. Will stand tremendous strains. Won't leak, nor buckle, nor crack from frost. **Cheaper than wooden culverts**

An Investment—Not An Expense

Investigate first. Send for the free sample and book. Then recommend this culvert to your township officials---push the Good Roads Movement---this culvert keeps roads in better shape. Use it, too, for any drainage about your farm---there's a size for every purpose. Railways use and approve it---and you know what careful buyers railways are! Investigate.

Rust-Proof Won't Decay Easily Laid

THE HORSE.

Different kinds of work require different kinds of horses. A horse is of no particular value except for what he can do. To fulfill his mission he must travel. If he can draw a buggy containing one or two persons at the rate of ten miles an hour he is valuable as a roadster. Another horse that can draw his share of a load weighing upward of a ton, even though he moves slowly, performs an equal amount of actual work and is just as useful to its owner as is the roadster. Since all horses are valuable because they travel, although at various rates and under widely varying conditions, it will be interesting to make a study of those parts of the horse's body directly connected with his locomotion.

It is not difficult to understand that, with the horse as with ourselves, all motion is the result of the action of the muscles. About 40 per cent of the weight of an ordinary horse is muscle. All muscles concerned with locomotion are attached to bones, and when they contract they cause the bones to which they are fastened to move The lower part of a horse's legs are nearly all bone, but the muscles in the body and upper part of the limbs are attached to various parts of the bony construction by tendons and can thus produce a motion of the parts located some distance away. The muscles we are discussing, when contracted, are about three-quarters as long as when at rest. The amount of motion produced by the action of the muscles of, say one of the horse's hind legs, will depend upon the length of the muscles and the length and the relation of the bones to which they are attached. The common idea among students of this subject is expressed in these words: "Long muscles for speed, short muscles for power." We have already seen that a long muscle enables a horse to get over the ground rapidly. A short muscle, however, is not powerful because it is short, but because in horses constructed on that plan the muscles are thicker, contain more fibers, all of which pulling together when contracted exert a much greater pulling force than a long, more slender muscle. It is because of this that in buying horses to draw heavy loads we look for large and heavy muscles; while in roadsters we must attach importance to the length of the muscles.

The most of a horse's muscle is in the hind quarters. This may be a surprise to you, but the next time you have an opportunity to see a horse pulling a very heavy load study him carefully. You will be impressed with the idea that most of the work is being done with the hind legs. When the hind foot is moved forward the toe rests on the ground and the leg is bent at the hock joint; if the toe does not slip and the horse is strong enough for his load the muscles above, pulling on the tendons fastened to the back and upper point of the hock, will close the joint, or, in other words, straighten the leg and cause the body to move forward. It is by the performance of this act at every step that the horse moves, although, of course, the strain on all the parts is much greater work when pulling very hard. This will also show the necessity of having large, broad, straight joints and legs that give the horse the most secure footing. You have probably also noticed when driving that many horses put their hind feet on the ground in front of the mark left by the fore feet, and the faster they go the greater will be the distance between the marks made by the fore and hind feet. This shows that the length of a step is determined by the hindquarters; it also explains the need of large, strong hocks, and legs that are not so crooked as to seem weak or so straight as to lessen the leverage afforded by this very wonderful arrangement of the parts.

Then there are some other things that are desired in all kinds of horses. One of these is a short back; that is, short from the hips to the top of the shoulders (the withers). From what we have learned of the hind parts we see that the horse is really pushing the rest of his body along. If the back is short and strong instead of long and weak the whole body will move more easily and rapidly in obedience to the force produced in the hind parts.

Although the hind parts have most to do with the horse's traveling, we must not forget that the front parts are also very important. No matter how much muscle a horse has or how strong his hocks are, if there is anything seriously wrong with his front legs he cannot travel, and so derives no benefit from his good parts. Some horses may be seen whose knees are not straight, others when looked at from in front show that their feet are not in line with their legs. Such animals are more likely to slip or strike one leg with the opposite foot, thus making themselves lame and unable to do any work.

Much depends upon the parentage of the animal. It is never well to mix blood; that is, draft horses, like Percherons, and horses used for fast road work should never be crossed with the object in mind of getting an animal fleet of foot and yet strong in body. Keep the blood pure and always grade up.

There are a great many interesting things about a horse which cannot be told here, but which you may learn at home or from some neighbor who keeps good horses. We will, however, say something about horses' feet. Inside a horse's hoof there are some very sensitive parts resembling the attachment of the finger nail and the finger. When anything gets wrong with the foot these parts cause a great deal of pain, and even though the horse is otherwise perfect, the pain in his feet makes him too lame to travel. Horses with large, wide feet, that are wide across where they touch the ground when you look at them from behind (or in the heels) are not likely to have this trouble.

Even though you have never studied horses you have seen some that impress you as being much more beautiful than others. No matter what kind of work is to be done, it is desirable to have a horse that looks well. Of course, it will depend upon whether the horse is thin or fat and upon the grooming he has had, but you will usually find that the horses which attract you have rather long necks that rise upward from where they leave the body; the head, too, instead of being set on straight up and down, will have the nose pointed a little forward; the ears will be rather close together and the eyes large and bright looking.

PROF. F. R. MARSHALL,
Ohio Experiment Station.

Feeding Horses.

The Kansas Experiment station offers the following good advice relating to hay feeding.

Either heavy or light horses that are doing regular, steady work should not, if one wishes to feed economically, have more than one pound of hay per hundred pounds of live weight. That is, a 1,000 pound horse should receive 10 pounds of hay a day, and a 1,500 pound horse 15 pounds a day. A 1,500 pound horse that is doing steady work should have about four pounds of hay with his morning feed, the same amount at noon, and about double the amount at night. Many horses will eat 30 to 40 pounds of hay a day if they have free access to it. If a horse is allowed to eat such quantities, half of it is wasted, and if he is eating that amount of hay, it is worse than wasted for it does the horse an injury.

From two to two and one-half pounds of digestible protein is all that an ordinary horse can utilize in a day and in 100 pounds of alfalfa there are 11 pounds of digestible protein. This fare of alfalfa, if too heavily fed, is likely to cause kidney disorder, and may even be responsible for abortion in pregnant mares that are fed too liberal a ration of it. If it does not cause abortion, weak, unhealthy foals may be the result.

Sidebones.

All breeders, buyers, and sellers should know what a sidebone is and how it should be detected, says A.S. Alexander, V. S. Stand with the back to the horse's head, lift up the nigh fore foot with the left hand, and with the finger and thumb of the right hand take hold of the side of the cornet (hoofhead) at the heel. At this part there is a ridge of elastic cartilage in sound horses, and it should be possible to bend it from one side to the other.

This is called the "lateral cartilage," and its purpose is to spread the heels apart and distribute concussion so that the leg above is not jarred in a damaging way. When this cartilage has turned to bone it is termed a sidebone, which may be on one or both sides of one or both fore feet.

Standing the other way and running the palm of the hand down over the coronet a marked or large sidebone may be detected as the thumb on one side and the fore finger on the other side meet it as a hard, rigid, bony enlargement. Both methods of detection should be employed in examining a horse, and horses having one or more sidebones should be rejected as unsound.

Lameness is usually present when a sidebone is forming, and when complete it so interferes with action that the animal is straight, stiff and stilty in front and often lame on hard pavements or roads. As sidebones are usually more prone to form on shallow, weak feet or on boxy, mule-like hoofs, they should be most suspected on such feet and animals having a tendency that way should be regarded with suspicion if intended for city work, while stallions should be rejected if there is a sign of sidebone, as the conformation favorable to the appearance of sidebones is at least hereditary and so transmissible to progeny.

ABSORBINE

Cures Strained Puffy Ankles, Lymphangitis, Poll Evil, Fistula, Sores, Wire Cuts, Bruises and Swellings, Lameness, and Allays Pain Quickly without Blistering, removing the hair, or laying the horse up. Pleasant to use. $2.00 per bottle at dealers or delivered. Horse Book 5 D free.

POULTRY.

The Difference Between Grit and Shell.

There is a difference of opinion among poultry men about the use of grit and shell—that is, of flint grit and oyster shell. It is a case of grit v. shell, really. The shell-only men are in an insignificant minority, it is true; but as long as the question is left undecided there will be minds uncertain on the point, and the point is one on which there should be certainty.

To see what fowls really did use or prefer, I penned a few, giving them a fair supply of stone and flint-grit and a large supply of broken oyster and other shells. Feeding was as usual for laying stock, a full grain ration being fed every night. At intervals of a months three fowls were killed, and the contents of their gizzards carefully examined. The results showed once more the insane folly of attempting to dictate to Nature, of telling hens what we think they must and should do, and how they should work their internal economy. In no case did we find any flint-grit in a gizzard, and in no case did we find any shell or the appearance of any shell. All the the birds had in their gizzards small, irregular pieces of quartz rock, mostly white, about the size of small peas, such pieces of quartz as you can gather among the gravel on the sea-shore. Quartz is the hard dim-crystal-like stone found among granite rocks. Each gizzard contained a supply of these, and no other kind of hard material of any description. I noticed that the supply of flint-grit in the pen seemed to last a very long time, and I noticed that no birds except the ones in heavy lay ever touched the broken shells, but I scarcely expected to find post-mortem results such as described above.

One of the fowls was an Asiatic of fair breed, the second was an Orpington rather mixed, and the third was a White Minorca. They had clearly rejected the flint for use as grit, and had searched for and deliberately picked up the quartz-rock. It was all white-colored, and one wonders if this had something to do with the matter. Probably not, because the shells were also white in color, and, as far as their use for grit is concerned, they had been entirely rejected. But this had been noted even before a fowl was killed. We saw that, whenever a hen stopped laying, she also stopped taking any shell; she only wanted grit then for grinding purposes, and for this she declined to have shell. There was no cock in the pen, but it was not likely that his presence would have made any difference to the test. If all hard substances suitable for grinding purposes had been kept out of reach of the fowls, excepting broken shell, no doubt they would have used that for grinding purposes as well as for egg making. It would have been a matter of necessity, not of choice. a pen of Wyandottes the other day Fowls are kept in this way. I saw which had nothing but broken shells from the sea shore, and no means of getting any other grit, as they were closely imprisoned and the floor of the run was fine earth. In that yard fowls had been kept in this way for a long time—ten to fifteen years at least. They were said to lay well and be healthy, but as it is impossible to get the facts of the case covering all the consequences and results, this ordering of Nature counts for little. To hear some people talk one would think there was nothing more to learn about poultry. "We know it all," and are simply going "treadmill style round about finality." Talk like that is some evidence of mediocre intelligence and absence of the analytical faculty. In truth, the best man going into the poultry world (do not all shout at once) knows very little about the essential principles of a hen's interior economy. It is unwise to say we have reached finality, and on any question of fowl procedure there are different problems bristling with unsolved difficulties and unanswered questions. At the same time, from the foregoing experiment it seems safe to infer that the use of shell both as shell and as grit is mistaken procedure, and should be stopped. It is evidently contrary to Nature, and in matters of this kind Nature is a very safe guide to follow. Of course, the habit that many ignorant poultry keepers have of mixing in shells with the soft food, and giving the whole mess to the fowls, is a barbarous and totally wrong procedure, and should not be tolerated for an instant in any yard. It is simply blundering stupidity. There is no defence for that. The other style does not seem to have much defence either. Shell alone is evidently not Nature's method of working. There should be two regular supplies of material, given for two totally different and distinct purposes. There should be a supply of grit proper—that is, broken flint or broken stones—solely for the purpose of grinding the fowl's food—i. e., to act as teeth. Then there should be a supply of oyster shells or seashells, or land or fresh water shells, if obtainable, for the purpose of supplying lime to the fowls for making the shell of the egg, and for no other purpose. These two distinct supplies of various material for totally different purposes should always be in the yard, not mixed together, but in two separate boxes, within easy reach of the fowls. In this way the poultry can follow the dictates of Nature, which is pretty certain to make and keep them healthier and happier than if they are forced to obey the dictates of human ignorance and presumption. For success in poultry keeping the old rule must be obeyed—instead of trying to force the hen to do as you want, you must force yourself to do as the hen wants. She knows best.—Feathered Life.

The Egg Eating Habit.

The oft-repeated cry, "Why do our hens eat their eggs?" is common at this time of year. Replies are given by eminent experts generally advising more activity for the hens, variety of rations, oyster shell and grit, dark nests, etc. All these things, of course, are essentials and if never lacking, the habit is seldom, if ever, acquired. Still, why do hens eat eggs? Let us see.

It will be noted that the habit is seldom prevalent among a flock of hens on free range during the summer, and this fact may lead to the theory that close quarters and idleness may be the cause. And indeed it is, in a sense; it is a contributing cause. But a few hens kept in a large stock will learn the habit and, getting only what feed they can dig out of the litter and manure can hardly be called closely confined or idle, and yet it is well known that such hens are amongst the worst offenders. They may be overfat then. This is true, but overfat hens do not lay at all.

Let us next examine the eggshell. During the summer when the hens are on free range, the shell is quite hard and a person feels that he may handle that egg without fear of putting his finger through. But how easy one crushes the shell in the winter! Eggs are even laid without any shell.

The material that makes the shell so hard is lime. It is also one of the hardest materials to feed a hen in sufficient quantity when once she becomes short of it. She won't drink water containing lime, if you scatter it on the floor in the hope that she will pick it up; you will still get soft eggs, if you get any.

There is one method, however, which we discovered some years ago and have never known to fail. Feed it in boiled grain. Just about a tablespoonful to a pail of grain, boiled with the grain, and fed with it, and in one or two weeks you will get eggs with hard shells on and little specks of lime all over the shell and never an egg will be eaten unless some hardened sinner still persists, in which case boil the sinner.

An ounce of prevention is most surely better than a pound of cure, and if you keep your birds active, feed roots, animal food and a little grain and keep a hopper of oyster shells and grit always handy, there will be very little trouble with hens eating eggs. If the shells should get a little thin, a boiled feed with lime once a week is the remedy.

THE FARM HOME

This Department is now being edited by a very competent lady, who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

The Girl Who Smiles.

The wind was east, and the chimney smoked,
And the old brown house seemed dreary;
For nobody smiled and nobody joked,
The young folks grumbled, the old folks croaked,
They had come home chilled and weary.

Then opened the door, and a girl came in:
Oh, she was so homely—very!
Her nose was pug and her cheek was thin.
There wasn't a dimple from brow to chin,
But her smile was bright and cheery.

She spoke not a word of the cold and damp,
Nor yet of the gloom about her;
But she mended the fire and lighted the lamp,
And she put on the place a different stamp,
From that it had had without her.

Her dress—which was something in sober brown,
And with dampness nearly dripping
She changed for a bright, warm, crimson gown,
And she looked so gay when she came down
They forgot the air was nipping.

They forgot that the house was a dull old place,
And smoky from base to rafter,
And gloom departed from every face,
As they felt the charm of her mirthful grace,
And the cheer of her happy laughter.

Oh, give me the girl who will smile and sing,
And make all glad together!
To be plain or fair is a lesser thing,
But a kind unselfish heart will bring,
Good cheer in darkest weather.

Jacassa's Journal.

By Mary W. Janvrin.

(Continued from last issue.)

"Sh! A young lady boards here" I heard Mrs. Hull commence; then the closing of the door precluded my hearing further. But I smiled, for I knew the honest woman would keep her promise of not betraying me; and I resolved to keep my embroidery, and the fruits of my morning rambles in the woods, henceforth in my own room.

Presently, "Miss Jacassy!" came from the foot of the staircase.

I was brushing my hair before the mirror. I took a few geranium-leaves from a vase and placed them in my braids, and, smoothing my muslin wrapper, went down

"Lisha, this is Miss Jacassy Bowen," was the very informal presentation to the tall man who lounged in the rocking-chair by the window.

He rose and advanced with outstretched hand and a well-bred air; but an amused smile hovered on his well-cut lips. "Aunt Sarah seems to have forgotten that her "Lisha," to strangers, shodld be 'Mr. Meredith,' though I trust I may not be long regarded as a stranger by Miss Bowen, whom I am happy to find under the roof of my boyhood's home," he said, politely, and still smiling in a kind of frank way that set me at once at ease.

"La, that's jest like me!" laughed Aunt Sarah. "But no wonder if I talk crossways, for your sudden comin' has upsot my head entirely, 'Lisha!" And, with a beaming face, she retreated to the kitchen.

I do not know that I shall apologize for the 'easy negligence' of my attire, Miss Bowen," said Mr. Meredith, still smiling, and glancing down to his dressing-gown, "though, surely, if Aunt Sarah had told me I were to meet any one and that a lady, I should have retained the professional suit of black."

"Pray, do not give yourself any uneasiness, Mr. Meredith," I replied, "for I, too, am a lover of ease and comfort, and trust that neither professional suits nor airs will be donned at Ryefield on my account. I dislike professions of all sorts, and professionists," I added, half sarcastically, half smilingly.

"You do?" he replied, in the same vein. "You are an anomaly, then, for young ladies usually constitute a large ingredient of the latter-named class, since they are constantly making violent professions of fancy, love, or friendship."

"I never make either," I retorted, glancing up to meet his half curious, half amused air?"

"Ha! you throw down the glove to me?" he laughed. 'I accept it; and if we two are to be located together under the same roof for the fortnight I propose stopping in Ryefield—and my aunt tells me you are passing the summer here—I foresee that we shall either become friends or enemies. My own inclinations would favor the former relation; but perhaps a perverse young lady's taste may be the latter. We shall

And so we fell into unstrained, natural conversation—he the dignified lawyer, and I the literary womaolb this might not have been; or if, under such circumstances, I had said to him what I had -ust saucily uttered, I am sure he wodld have thought me "strong-minded" and anxious for "an argument," and so avoided me. As it was, by the time Amos Hull came from the hay-field to dinner, to welcome "'Lisha" with a hearty shake of his hard, sunbrowned hand, and Aunt Sarah summoned us to the table set out in the long, cool kitchen, we were on excellent talking terms with each other.

At table, I sat, not opposite, but where I could have a good view of Mr. Meredith's side-face without seeming to observe him. He was not handsome—as ladies vote handsome men—for his features were too massive for the type of the Greek Antinous; but his hand was white, muscular, and shapely; there was a warmth and kindliness about his dark gray eyes, a gentle firmness about the well-cut lips, and, altogether a strength and repose about his whole manner which quite accorded with my idea of "a manly man." I never did like exquisites—beg pardon; I forgot Montague Livingstone Wentworth, though that hardly disproves my assertion, since the "I" of now and the "I" of then are two different beings. I do not care if a man be not over-particular in matters of apparel; in fact, to my thinking, the very carelessness with which he arrays himself betokens a mind absorbed in something else than the fopperies of dress which we women associate with "nice young men;" and I was secretly pleased to notice that Mr. Meredith's neck-tie was slightly loose and awry—it was so warm, that sultry July noon.

"Waal, now, Miss Jacassy, this is goin' to be jest the afternoon to be down on the beach," said Mr. Hull. "There's hundreds of carriages gone by this forenoon, and I s'pose the big houses are crowded. She's the greatest gal ye ever see for the salt water, 'Lisha"—turning to Mr. Meredith. "Guess you'll have to take a ride down there with 'Cassy"—this was a way the farmer had of abbreviating my name.

"And so Miss Boweb loves the sea?" said Mr. Meredith, turning to me, quickly. "I am glad of that. She shall ride down with me this very afternoon, that is, provided she will not place an injunction on my wearing this unprofessional dressing-gown!" And his mischievous gaze encountered mine.

"Agreed!" I laughed; "but I would advise you to take along a blanket shawl, in case the cool ocean breezes should blow in from the east, or a sea-spray should rise, damper on your ardor—all which accidents would be very pleasing no or a sudden thunder-shower put a doubt, to Mr. Meredith." m

"Certainly! I love Dame Nature in all her moods, whether she scolds, weeps, smiles, or evelops herself in the foggy mantle of mystery, for each is but a phase of her life. She is very fickle, quite like a woman!"

"Now fretting, now weeping, now smiling, now raising such a din about one's ears that heaven and earth hold no other similitude save the rattling thunder-peal," I laughed. "Flattering comparison that, Mr. Meredith, to us women."

"Yet I think the simile may be a true one," he returned. "There may be some of the latter sort, I doubt not, but—pardon the illustration," he added, courteously—"they are of that virago. strong-minded order whom we instinctively shun."

"Then you dislike 'strong-minded' women?" I asked, demurely.

"I must confess to 'the soft impeachment," he replied, laughingly. "From lecturesses, female physicians, authoresses, and all of that ilk, Heaven forefend me!" And he drew back with a deprecasing gesture. I was puzzled to account for the mischievous twinkle of his eye, but he added, quietly: "You will ride to the sea-shore with me this afternoon, Miss Bowen?"

"Now, that's too hard, 'Lisha!'-began good Farmer Hull, breaking in upon my affirmative answer. "If I were 'Cassy here, I never'd write another word of po—"

"Potatoes, Amos?" quickly interrupted Mrs. Hull, touching his foot under the table, and growing very red in the face, for, in her hurry, she had forgotten to communicate my request to her husband. "These are nice—the largest new potatoes I've seen this year. Chenangoes are the best for plantin', ain't they, Amos?"

I bit my lips, and glanced towards Mr. Meredith, but he seemed perfectly unconscious of the nature of the interruption; and presently, after Aunt Sarah's nice pudding, which he praised immoderately, and a dessert of tempting "black-heart" cherries, we left the table.

And, this evening, the sunset hour found Mr. Meredith and myself driving slowly along the wide, level beach. He guided his horse close to the edge of the breakers and into them to cool his fetlocks. How much I enjoyed it all—the sunset sky, the deep-voiced sea and Mr. Meredith's conservation, betraying such an acquaintance with books, men, manners, and life! When we rode slowly homeward, it was late, and the moon was rising out of the ocean, and the fresh sea-breeze made him glad to fold the blanket shawl over his shoulders, for Mr. Meredith had persisted in wearing the dressing-gown.

I am not weary or sleepy and so I have seated myself, at this late hour to write out this day's events in my journal. How well I know him and yet this morning we had not met!

August 20th.

Nearly four weeks have passed since Mr. Meredith came here, and yet he has not spoken of his departure: I think this quiet and repose in the summer days at Ryefield suit him well—he seems to enjoy everything so much. His partner, he tells me, is at Nahant, with his family, for Mr. Harlow has an invalid wife and two fashionable young-lady daughters. I have heard of them in town as two dashing; accomplished girls and belles. They live in a handsome stone front in P—— Square. Mr. Meredith seems to like to to talk of them—the Misses Harlow—particularly of Kate, the elder, a handsome brunette, who has a great deal of attention in society. I am not jealous. Why should I be? He is nothing to me. I suppose they are engaged, he speaks of her so freely, and I hope they will be happy. I hope she is worthy of him, for I could not bear to hear that, when he marries, his domestic life is not everythiog it should be, he has such a deep earnest nature, and is capable of such fine, tender feelings one would not credit in the keen, active business-man I know the shrewd Cyrus Harlow's partner must be. But in these four weeks' intimacy, seeing him here in the free domestic atmosphere of his boyhood's home, riding, walking, talking with him daily, I have had many revelations of his inner nature. "It makes a man cold, reserved, isolated," he says, "to have no pleasant home-ties, to live among strangers. The friction of the constantly active machinery of business sharpens the intellect, but it wears out the heart. He made this remark the other evening when we were talking. I suppose he will marry Kate Harlow by and by, and, in their elegant, refined home, he will forget his loneliness. His wife should possess a warm, aesthetic nature, like his own.

Well, I will not write longer here. I hear his merry laugh—he has a boyish laugh—from the great barn, where he is helping the men stow away the fragrant hay. Who that saw him up at sunrise this morning, swinging his scythe broadly with the mowers, would imagine him a city lawyer? His hands are browner than they were when ne came here, and his forehead is sunburnt, too. I believe I am brown as a gypsy myself; he said I looked like one, the other day, when he put a splendid crimson cardinal-flower in my black hair, down by the brook-side in the woods. I certainly look and feel far unlike the pale, worn woman who left the stifled city with the early Maytime. I had grown so tired so tired of the shadows of high brick walls that "I go in the sun, now, when I might go in the shade," Mr. Meredith says, " from a pure womanly spirit of opposition." He loses no opportunity to tease me. I wonder why he never asks me in what portion of the city I make my home. That would be only natural; but I really begin to believe—what is often said of our sex—that women possess all the curiosity. I should have asked a hundred questions where he asks none. Perhaps, though, it is because his circle of acquaintancees is circumscribed to the aristocratic limits of P—— Square and he would not want to recognize on return to town, one whose means will not permit a first-class boarding-house. If I thought that—but no I am foolish! That was a puerile and as unworthy myself as him. I

FIRE, LIGHTNING, RUST AND STORM PROOF

SIMCOE, ONT., April 9th, 1908
"We have handled your 'Eastlake' Shingles for nearly a quarter of a century. They have been on the Court House, Free Library, and other public buildings of this town for 18 years. We have used very large quantities during the past 25 years, and they have always given first-class satisfaction, and have never required any repairs."

Keeping House by Machinery.

"To work for work's sake seems to be stupid," said a clever friend of mine, who is withal an excellent housekeeper, and always ready in her leisure time to extend a gracious and easy hospitality to her many friends. "I avail myself of every good, labor saving machine that is offered and consider the money thus spent my best paying investment. Our house is small, and domestic service of a satisfactory sort is difficult to secure, and more difficult to retain. Our vacuum cleaner replaces a housemaid, and our fireless cooker, that works quietly, all day and all night with never a complaint, is so efficient in its department that we scarcely regret the absence of a cook. Our dish-washer has reduced that dreaded task to a minimum, and-Tell it not in Gath!'—we use it only once a day."

A washing machine makes the laundry work go quickly, and our patent drier is so satisfactory that Mrs. Smith, our weekly "help," can accomplish as much in one day at our house as she does in two places where old-fashioned methods prevail. A revolving table that has several shelves and can be wheeled into the pantry, takes care of the dishes removed at the end of each course, for our service is as dainty when we are alone as when a guest is present.

If the housekeeping seems to run automatically it is because mother is a master at reducing things to a system. It takes brains to so plan the running of even the simplest home, that no one hears the cranking of the cogs, and the planning is always for the easiest possible methods consistent with comfort.

In a little closet in a cool corner of the large pantry we keep what we call our "reserved stock" of prepared foods, which can be served at a moment's notice, and thus meet unexpected calls upon our hospitality. Canned soups of the finest grade, in different sizes and styles, French peas and string beans and whole tomatoes, fine sardines and salmon and homemade salad dressing in a jar enable us to concot an appetizing salad. Hawaiian pineapple, which is picked at the moment of perfect ripeness and canned on the spot, we find delicious in sliced form, eaten with a spoon like grape fruit, for this, unlike the ordinary pineapple, has no woody fibre, and in the crushed and grated froms makes dainty ices, creams and desserts. Jellies, Pickles, and jams, peanut butter and potted meats and cheeses are always on hand in this closet.

We buy only the best brands of prepared foods, for we find that though the "United States pure food stamps" protect one from foods that are positively detrimental to health, they do not be any means insure the flavor and deliciousness of the contents. Only the brand of the maker can be relied upon for this, so we test the quality of such goods and stick to the kinds we like, rejecting all "just as good" sorts, which usually prove disappointing.—Reader.

Home Made Rugs.

There are so many uses for rugs about a farm house, particularly since bare floors, or at least carpetless floors are the order of the day that every effort should be made to have a good supply on hand. The new ones are just the thing for bedroom while the old faded ones are well for rainy days in kitchen and on porches. The careful housekeeper knows that it is comparatively easy to spread down an old rug on the porch and another by the kitchen stove, as the men come in and out on cold, wet mornings, and thus save the better rugs and carpets much wear and tear, while as floor coverings in times of butchering, house cleaning and other dirty work they are ideal.

Of all the rugs known to womankind the common rag ones woven in looms are the best. Braided rugs are pretty, but too much trouble for the busy, housekeeper and darned rugs are open to the same objection. Of course, if one has time a prettily matched braided rug or one darned in a frame for the guest chamber is very nice, but most country ladies of the present have no time for such things. In the olden days when there were many daughters in the home, or the daughters of a neighbor was ever ready to lend a hand, wonderful rugs were constructed, but nowadays the pretty hit or miss woven ones are most liked by busy women.

Cotton rags should be cut or torn one inch wide or one and one-quarter inches for a good, smooth rug, while heavy wool goods must be narrower. It is a good plan to keep the cotton rags separate from the others, and the rags separate from the others, and the woolen rugs are best for bedrooms where they will scarcely require washing for years. Sew the rags securely, as the busy weaver will tie any that come apart and thereby make a knot in your rug. Avoid abrupt turns in cutting them, for these turns will also make rough places. Fold the places where you sew them, and make the whole ball smooth and even. Many ladies boast that they can cut an entire garment into one long rag, but aside from the monotony of several inches in a rug of the same color, there are apt to be many rough places when this plan is followed.

Another thing to remember is to have plenty of good, strong carpet warp. It is always better to furnish this yourself and insist that it shall not be saved. A poorly woven rug full of holes is a nuisance and your time and money are thrown away, while a good one will last for years.

RED ROSE TEA.
"Is Good Tea".

The only Shingles guaranteed lightning-proof

The farmers of Canada each year lose thousands of dollars by lightning. In future they, or you, need not lose another cent from this cause. Simply roof your buildings with PRESTON Safe-Lock Shingles. They are guaranteed proof against lightning.

Our Lightning Guarantee is legal. Send for a copy. Let your lawyer read it. He will tell you it fully protects you against loss by lightning.

We don't charge you a cent for this Lightning Guarantee. Yet you couldn't even buy a lightning guarantee from the makers of wooden shingles or prepared roofing.

PRESTON SAFE-LOCK SHINGLES

You don't get a Lightning Guarantee with any other roofing. Neither do you get shingles galvanized according to British Government Specifications. Nor Shingles SAFE-LOCKED on all FOUR sides. 9

Send for the new and improved edition of "Truth About Roofing." It gives roofing facts you would be willing to pay for. We will send you a copy free provided you fill in and send the coupon promptly.

Branch Office and Factory at Montreal, Que.

King Street Factory. Please send your booklet, "Truth About Roofing." I am interested in roofing and would like complete information about PRESTON Shingles.

The Sunny Side.

A friend whom I used to meet daily when walking to my work on bright days, after exchanging greetings, would always say, "Come across to the other side of the road where it's sunny." A simple little remark, but it was charastic of her; she chose the sunny side of everything. A person may lack education, know poverty, be very busy, but wherever you find one who looks on the sunny side there you find one who has many friends and is truly helpful. There is hardly a quality which "pulls" so strongly today as cheerfulness.

Undobtedly it is easier for some people to be thus than for others; they are gifted that way by nature, but a bright outlook can be cultivated. Many think cheerfulness means a sort of boisterousness of spirits. This is not so, for often the quietest of folk have the most persistently bright outlook of any.

Probably with all of us work takes up most of our waking hours. We have but few 'leisured folk, whether by reason of preference or by circumstances, in our busy young country. Therefore it is in and through our daily work that we have to discover the sunsshine. The greatest help of all is to do the particular duties which are ours in the best way they can be done; there is keen satisfaction in that. A thorough knowledge of our work is essential to the finding of real pleasure in it. But some will say that it is often hard to find out the best ways, and that they have been forced into doing this or that without proper training or preparation for it. No matter how we are circumstanced, are there not one or two avenues for advancement always open? Observation is perhaps the most important. We cannot help coming into contact with someone who has a different way to ours of doing things, possibly a better way, and there is no patent upon that kind of idea; it's ours to observe, to carry home, to put into practice.

Then reading is a help. From a careful reading of much that is within our reach today we may get one good helpful thought which when used will mean that our work is of just a little higher grade, and that system kept up will make us not only more successful in our special sphere, but will keep edging us over to the sunnier side of life, our greatest incentive to a cheerful outlook coming through our work.

It is quite possible to do splendid work, and take great uleasure out of the doing of it, even though that particular work would never have been our choice. In other words, there is such a thing as an acquired liking for something which is inevitable. "If we can't have what we like, let's like what we have."

There is still something more. Never must we feel we have reached the place where there is nothing left to be learned about our work. That means no room for ambition, no room for growth, no room for thinking, and to be happy the average man or woman needs all three. Work intelligently done not only loses much of its drugery, and brings joy through the satisfaction of knowing that it expresses our best, but it also colors all the remaining hours of the day. There is little pleasure in pastime unless there has been pleasure in work.

And so it comes back to the starting point. Let's look on the sunny side, and be able to do this let's develop, and broaden, and think, and put our best into the humble or the great tasks which may be ours. A sunny outlook on life does not depend upon our circumstances; it depends entirely upon our attitude to our circumstances.

"Our lives are songs; God writes the words,
And we set them to music at pleasure;
And the song grows glad, or sweet, or sad,
As we choose to fashion the measure.
We must write the music, whatever the song,
Whatever its rhyme or metre;
And if it is sad we can make it glad,
Or if sweet, we can make it sweeter."

Put Any Weight on a Maritime Fence

and it stands the test. Man or beast can't break it down. Maritime Fence never sags or gets out of shape. Made from extra heavy imported hard drawn steel wire, thicker, stronger and galvanized so it is peel-proof. It is the last word in strength and durability.

The staying quality of Maritime fence is in the simple lock with the bull dog grip. It never lets go—never lets the fence get crooked. Maritime Fence is always sightly; always straight—always best. The quality of material and construction makes it best.

Don't buy fence until we have put our catalog and price list into your hands, postpaid, by mail. Costs you nothing to find out all you want to know about wire fence. Get your pen now and write on a postal "Send the catalog." 9

MARITIME WIRE FENCE

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Wharf at Sackville, N. B.," will be received at this office until 4 00 P. M., on Monday, July 4 1910, for the construction of a Wharf at Sackville, Westmorland County, N B

Plnas, specification and form of contract can be seen and forms of tender obtained at this Department, at the offices of E. T. P. Shewen, Esq., District Engineer, St John, N B; Geoffrey Stead. Esq., District Engineer, Chatham, N. B., and on applicatson to the Postmaster at Sackville, N, B,

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures, stating their occupations and places of residences. In the case of firms, the actual signature, the nature of the occupation and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, made payable to the order of the Honourable the Minister of Public Works, for two thousand seven hundred dollars ($2.700.00,) which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By Order,
NAPOLEON TESSIER,
Department of Public Works,
Ottawa, June 2, 1910.

Newspapers will not be paid for this advertisement if they insert it without authority from the Department.

Some Household Hints.

To Clean Woodwork.—To clean greasy marks off of woodwork around the kitchen stove or knobs of doors, wet a cloth with kerosene and rub over them. The same is good for cleaning marble washstands.

Painting the last cellar step white will save many a fall.

Boiling water poured over fish will make the task of cleaning easier, as it causes the scales to curl and they can be scraped off without flying about.

A Pie Hint.—When making pies, if the pans are greased with a little butter, it wil, make the undercrust brown and flakey and prevent the crust from becoming soft. It also makes the pie easier to remove from the pan.

Never use hot water to rinse either hands or utensils after preparing onions, as it seems to set the odor. Cold water in abundance is the best remedy.

Clear Black Coffee will clean black clothes, if diluted with water containing a little ammonia.

Hot grease when spilled on the floor can be easily removed by quickly dashing cold water over it, so as to harden it quickly and prevent it striking in.

Baking Powder Biscuit will be much better if you roll dough thinner than usual and use two cuts instead of one for a biscuit, laying one on top of the other. Made in this way biscuits will break open at once and are daintier.

Washing Machines. — Washing machines are a household necessity and if you have not one the deficiency should be supplied as soon as possible. See that the working parts are kept well oiled, kept free from gummy dirt. If the wringer rollers become stained, clean them with a cloth dipped in coal oil, then wash with soap suds. Loose the rollers before putting the wringer away. Keep a little water in the machine to keep from drying out and becoming leaky.

Twine Holder.—Hang an ordinary tin funnel on a convenient nail in the kitchen, drawing the end of the twine through the end. It is a convenient little device.

Apple Dumplings.

Boiled.—Pare the apples carefully, cut them into quarters and take out the core. Mix together a little butter and brown sugar, take a clove and a small strip of lemon-peel. Put these into about as much butter and sugar as will fill the hollow of the apple when the four quarters have been put together again. Put two quarters together. Put the mixture into the hollow, piling it up. Place the other two quarters on the top, and surround the peeled apple with some suet crust. Tie each dumpling up in a floured cloth and boil for about three-quarters of an hour, or rather longer if the apples are large. Throw them into boiling water. Be sure and take all the core out of the apple.

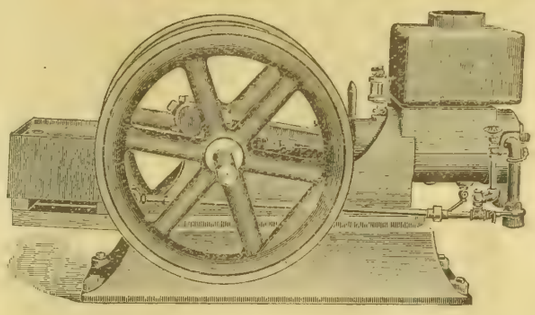
Baked—Proceed as before, but instead of tying them up in a cloth place them in a buttered tin and bake in a moderate oven for about an hour. If the ovens is fierce the crust will get done before the apple is tender.

If you are not satisfied after using according to directions two-thirds of a bottle of Chamberlain's Stomach and Liver Tablets, you can have your money back. The tablets cleanse and invigorate the stomach, improve the digestion, regulate the bowels. Give them a trial and get well. Sold by all dealers.

WE WANT AGENTS RIGHT AWAY!

In every section in the Maritime Provinces where a gasoline Stationary engine can be sold. The one we have to offer, which appeals most to farmers, is the

"Waterloo Boy"



Frost Proof Stationery Engine.

These Waterloo Engines are well and substantially constructed of the best material, by skilled mechanics, and are so durable that the makers have no hesitancy in extending to users their five years' guarantee. Engines are built on the interchangeable plan, all parts being made from jigs and templates, each and every part of the same kind being perfect duplicates, so in future years repairs that may be required can readily be placed without delay.

All the working parts are exposed to view and the duty of each part is readily understood by the user of the engine. The construction of these engines is such that they combine great strength and durability, yet it has been the manufacturers constant study to do away with all extra parts and simplify the construction as much as possible.

If you are looking for a good, reliable and up-to-date gasoline engine to handle—one which sells itself and leaves you a fair margin—write to-day for particulars.

Mushroom Poisoning.

When one considers the frightful consequences of gathering and eating poisonous mushrooms in mistake for the edible variety, it is little short of marvellous that one without knowledge should dare go into the fields and woods and pick and eat any of the fungi growing there.

If one is throughly familiar with some particular variety of edible mushroom, and can distinguish it at sight from all others, however similar in color and form, it is safe to eat that particular variety; but one must beware of other kinds that resemble it, for however slight the difference in appearance, one may be edible and the other poisonous. There is no absolute rule for distinguishing the edible from the poisonous kinds, and it is better, therefore, to give no general rules, but to follow only one: Suspect every mushroom which you do not know positively to be edible. To this rule, perhaps, may be added a second: Learn to distinguish the white-spored agaricr and avoid them all; for although there is an edible species it requires an expers to tell it, and the poison of another species is deadly, and there is no known antidote for it.

The chief poisons in mushrooms are two in number—muscarin and phallin. The first of these produces symptoms resembling those of alcoholic intoxlcation, followed by convulsions or paralysis, collapse, and death from heart faildre. These symptoms come on soon after the mushrooms have been eaten.

In poisoning by phallin the symptoms do not appear until several hours after the meal. They resemble cholera, beginning with severe abdominal pain, soon followed by vomiting, purging and collapse.

In all cases of mushroom-poisoning vomiting should be induced as soon as possible, and a large dose of castor-oil may be given to hasten the elimination of any as yet unabsorbed portions of the mushroom.

Stimulants are needed to support the heart, and milk containing an abundance of magnesia or bicarbonate of sodium may be given.

Injections of a salt solution into the veins and—in case of muscarin poisoning—hypodermic injections of atropin are often employed by physicians with benefit.—Youth's Companion.

Animal Comfort.

One woman, talking of another who had met with great troubles and was left lonely, remarked that "Mrs. A. has a good appetite, and it is a great pleasure to her." I looked at the speaker curiously, uncomprehendingly. Foolishly I thought that there could be no material compensation in the smallest degree for a blank in the affections. Great trouble was associated in my mind with a sick appetite, and it seemed to my ignorant and constitutional asceticism a vulgarity to pride oneself upon a hearty appreciation of food when one's home was laid desolate.

It was not long after that I heard a family talking of having been in the dumos one week of miserable weather, when there was nothing on to relieve the tedium. After a particularly depressing day, when they had been disappointed of a social outing—"We just said we must have something to comfort us, so I set to work and prepared salmon steak for supper, and we felt cheered up after that." One of my own family looked across at me and said, whimsically, "Why didn't we think of that the other day, when I was tired out and you had a headache, and we felt very flat all evening? Now we know what to do."

I was repeating this story to some other friends, and asking their opinion:—"Do you ever find it comforts you in the various trails and disappointments of life to turn your attention to an extra good meal?" "Of course we do," they replied; "that's our favorite resource when we are hipped and fancy we have cause for feeling that the world is not using us as well as it ought to. We have something extra nice for supper, or perhaps for tea. Earlier in the day the remedy is not so efficacious. The time you require comfort is before you retire to bed, you know." Why, they went on, as if in reply to the enquiry on my face,

Amatite ROOFING NEEDS NO PAINTING.

MOST ready roofings require special painting and coating, and unless this is done regularly, you are sure to have leaks and trouble right along.

If you use Amatite, nothing of the sort is required. You will have real roof protection WITHOUT PAINTING of any kind.

Amatite is made to stay waterproof and give protection year after year, without any thought or care on your part.

FIRST—Because it is waterproofed with Coal Tar Pitch.

SECOND—Because it has a real Mineral Surface.

Amatite, owing to these features, is the most economical roofing made. Its first cost is low, and you are SAVED all future expense for repairs or paint because it will need neither.

If you haven't seen Amatite, write for a sample to-day. From it you will very quickly understand why it doesn't require painting; why it does not leak; and why it saves you money.

Father Morriscy's Liniment Relieves Pain

Rev. Father Morriscy

Aches and pains yield quickly to Father Morriscy's Liniment. It is absorbed quickly by the skin, and penetrates deep into the tissues, making it splendid for sore muscles, stiff joints, rheumatic pains, backache, sore throat or lungs, or any **deep-seated pain.**

It eases at once and heals **surface hurts,** such as cuts, bruises, burns, scalds and frost-bites.

For tooth-ache and ear-ache it is an excellent remedy.

Father Morriscy's Liniment is exceptionally good as a "rub" for athletes. It takes out stiffness and soreness after severe exercise, and never blisters the skin.

Keep a bottle handy, for

"There's ease in every drop".

25c. a bottle—at your dealer's. 111

Father Morriscy Medicine Co., Ltd., - Chatham, N.B.

"you haven't learnt the most elementary law of self-preservation—the preservation of courage in face of the inevitable blows of fate. You try it. Have you never tried it?" After a moment's consideration I confessed that once, years ago, when a calamity fell upon the family, we took to having a cup of tea after dinner, and something tasty to late tea, saying to each other we must keep ourselves up. The peculiar taste of that tea is in my mouth yet—the savour of the terrifying force that lies hidden in the darkness ready to pounce upon us at an unsuspecting moment. After a few weeks, when body and mind began to recover tone we said to each other that we must not yield to self-indulgence, and that the after-dinner cup of tea must be abandoned.

Not long ago I was staying with a family where tea was served after the dinner-cloth had been removed. I rather demurred at this superflous cup, saying that it spoiled my pleasure in the tea which came later. They explained that they started the practice when ——took ill and died, and it had now become necessary to them. Here, I thought, is further illustration that the craving for bodily comfort in times of mental distress is inherent in human nature. It is, of course, a healthy craving. The mind fails if it is not sustained by the body; and if the brain does not send out an imperious command for extra nourishment or stimults, there is danger of the health suffering at those crises in life when it is most needed. The danger of yielding to the appetite for its own sake need not be entered upon here.

The Woman of Many Woes.

There was once a woman named "Sarah Belle," who lived in a small Ontario community, where she was known as the smartest girl in the country school and where she dreamed the ambitious dreams which most Canadian girls know. She finally went away to the city, where, after years of endeavor, some of her dreams came true. Last summer she went home for a long holiday—the first she had known—to the pretty village of Oakdene, where she enjoyed such air and milk and roses as she had not known since she left the old homestead. There were visits innumerable to be paid, and one day Sarah Belle came home with a thoughtful pucker on her forehead.

"What's the matter, Sarah Belle?" asked her mother, who had never been able to discard "Sarah Belle" in favor of "Sadie."

"I'v? been to Cousin Libby's," was the brief reply.

Her mother laughed. "That's enough to make any girl look blue." Libby gets worse every year. What had she to say this time?"

"Oh, she isn't understood."

"That's the worst misfortune of all."

"She says that none of the neighbors sympathize with her or realize what she suffers. It's no wonder that Cousin George died. Her complaints would drive anyone underground.

"Poor George! Libby certainly talks about him as if he had been an angel."

"And when he was alive, he was always being scolded for bringing in mud on his shoes. Really, that woman has given me a headache. She talked her troubles, from the time she saw me coming until I fairly ran away. She seems to have every disorder under the sun, from lumbago to a weak heart. She told me of all the diseases in the neighborhood, until I felt as if there must be deadly germs all over the room. I think women like Cousin Libby should be chloroformed."

Never mind. Go and see Cousin Grace tomorrow, and you'll forget all about Cousin Libby and her woes."

Aren't there too many of the tribe of Cousin Libby—women who retail their troubles for the benefit of their unfortunate friends and acquaintances, and who make the world more gloomy for their presence? They wonder at the close of the day why they are left so lonely, but never seem to conclude that they, themselves, are to blame.

That Tired Feeling.

There is a very common fallacy generally believed, that one hour's sleep before midnight is worth two after it. Healthful sleep is good at any time, and no one set of hours is better than another. Yet, like most of our mistakes, there is a truth about it somewhere, and this truth ought to be seen, but seldom is. It is worth while for every woman who has a family whose best interests hang upon her health and life, to closely study the meaning at the bottom of the mistake.

Most mothers rise at a certain hour, and ho their day's work. Now, if they go out visiting and stay later than their usual hour for retiring they have used up more of their vital force than usual. I have a self-feeding stove. If I neglect it, and it burns low, it takes more coal to fill it. If a mother has been up and about for twenty hours instead of sixteen she is more tired, needs more rest. If she gets up at the usual hour—sleeps six instead of eight hours—she goes to work with lowered vitality, is sooner exhausted and instead of working upon the force stored in every part of her by sleep, she works upon her nerves, upon brain and muscular matter—not the overplus of their energy; and working upon our capital of any sort is the easiest way of going into bankrupscy. More sleep if more tired is the sensible way.

The Fly a Disease Carrier.

The American Civic Association has organized a regular campaign against the house fly. As part of the campaign a series of moving pictures are shown in which the fly, greatly enlarged, is depicted in the act of collecting filth and disease germs and conveying the same into houses and depositing them in sugar and food, scattering them on the baby's milk bottle and laying the foundations in a dozen ways, for sickness and perhaps death.

The fly is undoubtedly a more potent agent for the dissemination of disease than bad water. It lives amid filth,, its legs carry disease germs wherever it moves, and if it passes over food stuffs these germs are left there with consequences to those for whom the food is intended that can be easily imagined. As a means of protection against the fly there should not only be screens in every house but special pains should be taken to have all filth cleaned away from the neighborhood of houses in which people live. Where manure is left about a stable it should be sprinkled with fresh lime or diluted carbolic acid as a means of keeping flies in check.

A Brief for "Beaver" Flour

1. Eat more bread made from BEAVER FLOUR and less meat, and you will be better nourished, at the same time reducing the cost of living.
2. No special pastry flour is needed, for BEAVER FLOUR makes the best pies, cakes, biscuits and rolls.
3. It contains the valuable gluten and proteid constituents of Manitoba No. 1 Hard Wheat, but makes finer, whiter bread than if made from that alone.
4. It owes its delicacy and lightness to the carbo-hydrate constituents of Ontario Wheat in just the right proportions, but is more nourishing than if made from that alone.
5. It readily takes up water, and makes larger loaves and more of them.
6. It tickles the palate of the whole family, and does them good.
7. A few good reasons are as good as a thousand, so we will now, Your Honor, rest our case.

"Beaver" Flour

Be sure to note that the decision is for BEAVER FLOUR,—
with the costs assessed to those who do not use it.

FLORICULTURE.

O. A. H., of St. John, writes:—I want to plant some Golden Glow in another place from where I planted it in the spring. They are now about eighteen inches high. Is it safe to try it now or had I better wait until fall? I wish to move them if possible and would like any instructions you can give me.

Ans.—It is, of course, too late to transplant hardy plants, roses or shrubs but in our correspondent's case, who has only such a short distance to move the Golden Glow, it is quite feasible. Make a hole large enough and deep enough to hold all the earth that you can dig up with the plants and dig around the plant with this idea in view. Move as quickly as possible and water thoroughly. Protect from the sun for a few days. Your plants will probably wilt some, even one might say, badly, but if you keep moist and sheltered from the bright sunshine they will come all right.

It is a sight to see Iceland Poppys at this season of the year if planted in masses. How they stand out from among the foliage and with quite a range of color too. They used to be all yellow, but white and red are quite common now.

This week is about the right time to set out all tender annuals such as Mignonette, Petunias, Stocks and the week after is plenty of time for Heliotropes and Tuberous Begonias. By the way, how few persons know what a splendid plant the latter is for shaded spots. This is a very useful piece of knowledge and should be remembered.

Writer, says:—A few weeks ago I planted some Pansies in a bed under a tree; the soil is moist and rich. During the last few days I have seen plants after plants wilted in the morning—the ground is very moist. I can easily pull them up, and if I do not, they turn yellow and dry up. I had the same trouble last year but not so badly. What is the matter? Can I sow any other seed in the place and have plants bloom this year?

Your Pansy beds are infested with the wire worm, a most difficult pest to get rid of. You are apt to lose all your plants and had better not try to grow them in this bed for some years. Soot is a good remedy but quantities sufficient to kill wire worms will usually kill vegetation outright. You better try a new place or bake the soil before planting the Pansies.

The Sweet Rocker which blooms at this time of year is very fragrent and lasts so long when cut in the house that it should be in every garden for an early bloomer as it is also one of the finest bloomers as it branches all up and down the long stalks, and it lives in the ground all winter.

The Beauty of Sympathy.

The woman who desires to please cannot rely on physical beauty alone although the really pleasant woman is never plain. Her power lies in her true sympathy with the troubles and sorrows of others. That sympathy expressed not so much by words, as by a sweet smile of encouragement, and a tenderly spoken word. No sympathetic woman is ever tactless. She never upbraids one whose head is bowed with grief, and never affects to be superior to the little weaknesses which trouble others. What a wonderous power she has! Her very presence encourages and brightens the path to those who come in contact with her. They go to her in all their troubles, for they know they will be understood. And if she cannot show them a way out of their difficulties she will at least cheer them with her sympathy.

Keeps out large Animals—Keeps in the Chickens

We've put strength and stiffness into the PEERLESS JUNIOR Poultry Fence so it can stand the attacks of restless animals from the outside. We have made it close enough so small fowl cannot get through. It is made of much heavier wire than the ordinary poultry fence, well galvanized, therefore much more durable.

Peerless Junior the fence that saves expense

That heavy, No. 9, hard steel wire at top and bottom holds the fence taut and true without the necessity of fence boards and saving more than half the usual number of posts. That means considerable saving to you. Write for our printed matter about PEERLESS Fences. We make fences and gates for every purpose.

BANWELL HOXIE WIRE FENCE CO., Limited

Perpetual Youth.

Let Me Tell You How to Regain All Your Old Vim, Vigor and Manly Strength. Be a "Health Belt Man;" Feel Young for Balance of Your Life. Age Doesn't Count if You Have the Vitality.

"I could shout for joy. After years of Weakness and Debility, your Wonderful Health Belt cured me. I am a man again. Use my name as you see fit."

Leon Turpinat,
Stellarton, N. S.

Perpetual youth. That is precisely what I mean. I say as man to man give my Health Belt a reasonable chance and it will carry you through any business, mental or physical strain you may be under. It doesn't stimulate; it simply adds the electro-tonic element to your bone, nerves, tissue and blood; all the force and strength which has been drained from your system by some earlier indiscretion. My Health Belt is essentially a strength giver. It overcomes the private symptoms of weakness in men which sap the vitality. If you are nervous and lack manly vigor, you are passing away thousands of brain cells every day. Ask your physicians if this is not true. I stop this awful weakening process. You wear my Health Belt nights; while sleeping a great stream of soft electricity passes into your body at the small of the back; it cures backache in one application; you feel better immediately; inside of an hour; two months will make a new man of you. No drugs; no privations; no restrictions except that you must give up all dissipation. Follow my advice and I promise you will feel younger and look younger. Let me restore your vitality, and you will be able to face the world with new ambitions. The Health Belt cures other ailments too. A positive remedy for rheumatism in any part of the body, sciatica, lumbago, kidney, liver, stomach disorders.

Special attachments furnished, and worn by women as well as men.

FREE UNTIL CURED.

Call or write to me and I will at once arrange to let you have the Belt on trial, not to be paid for until cured. No deposit or advance payment. Send it back if it doesn't do the work. Liberal discount for cash if you prefer to deal that way.

Let Me Send You These Two Books FREE.

They fully describe my Health Belt and contain much valuable information One is called "Health in Nature" and deals with various ailments common to both men and women. The other, "Strength, the Glory of Man," is a private treatise for men only. Both sent upon application, free, sealed, by mail.

If in or near this City, take the time to drop in at my office that you may see, examine and try the Belt. No charge for professional advice either at my office or by mail. If you cannot call, fill in the coupon and get the free booklets by return mail. They are better than a fortune for any one needing new vigor.

Some Factors in the Control of Moisture in Orchard Soils.

(Continued from page 591.)

6. Rape has proven an excellent cover crop for drying out the soil in the late Summer an Autumn months. In this respect it is fully the equal of the legumes usually sown for this purpose.

In conclusion, we may emphasize the essential points we have endeavored to bring out ' First, very great value of cultivation for conserving soil moisture and she desirability of means during the first three months of the growing season, to supply our orchards with the water necessary employing in many districts this for the full development of their fruit. Secondly, we have proved the extremely exhaustive effect on soil moisture of sod and of grain crops. Their injurious influence on the growth of the tree—especially the young tree—and the development of fruit, so often to be observed on dry soils, is fully accounted for by the results of our investigation. And lastly, that legumes and rape are suitable crops in most districts to sow in mid-Summer when the drying out of the soil is considered desirable to hasten the ripening of the wood before Winter sets in.—F. T. Shurt, Ottawa.

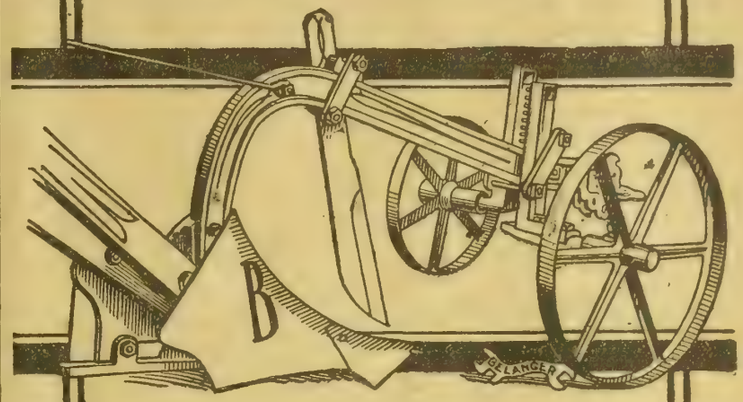
Farm Problems.

Enteritis.

J. H. S. Tantallion, N. S. Ques.—Being a reader of your valuable paper for some time I would like to ask a few questions regarding a sick horse I once had. She was bothered with worms and a friend advised me to give her turpentine in raw oil. I gave her four ounces of turpentine, after which she passed a lot of worms but got wet a few days after. I drove her to town a distance of 20 miles. On the return trip she took sick about nine miles from home. When pain would take her she would go so fast I could hardly hold her. If I would stop her she would lie down. Being a lonely road there was no place where I could give her some medicine. When I got home, before I could get the harness off her she laid down and got up about ten times, as fast as she could. I gave her soda, 10 ounces, ginger, 2 ounces and new milk 1 pint. Then I gave her an injection and when her bowels moved she appeared to be eased. Then she would try to urinate but could not. I gave her 1 ounce of nitre and continued the dose 90 minutes later. Then I gave her white resin, one hour after, 1 ounce, then 90 minures after 1½ ounces. One hour after she urinated. Her sickness lasted from Saturday 4 p.m. until Sunday at 3.30 a.m. She seemed better Sunday. She was worse Monday, continually getting up and laying down. Tuesday and Wednesday she remained the same and Thursday she would eat a little. Friday, she ate considerable of hay and a little bran. During Tuesday and Wednesday her offal was mixed with something that looked like matter. On Saturday she became worse and would try to urinate but could pass only about one ounce at a time. She was in great pain and would stand in her stall, shake her head, paw, lay down, get up and kept on in this manner until 6 o'clock p.m. Saturday, seven days from date of sickness. At ten p.m. she laid down and half an hour later she died. I opened her and found that her internal parts were badly swollen and full of water. All around there were clots of blood and her bladder was bursted. How long could a horse live with a bursted bladder? State cause of disease, name of disease and cure for disease if possible.

Ans.—The disease, at first, was probably colic followed ny Muco Enteritis, (inflammation of the inner coat of the bowels) followedby Enteritis (inflammation of the several coats of the bowels) and that followed by mortification of a portion (perhaps large) of the bowels, Mortification being the immediate cause of death. The disease, at first was probably caused by the excessive dose of oil of Turpentine which is an irritant when applied to a horses skin or mucous membrane, which is a membrane lining the digestive track, from the mouth to the anus and continuous with the skin Probably the irritable condition was aggravated by the wetting and after treatment as from two to four drams is an advisable dose of Bicarbonate of Sodium and half that quantity of Carbonate of Sodium is a dose. A dose of Ginger is from four drams to an ounce. In this case twice the quantity was given. Good treatment after the animal was attacked by the disease would have been to place the animal blanketed comfortably in a comfortable, well bedded box stall and given about one dram of Powdered Opium, four drams of Fluid Extract of Belladonna and twelve ounces of raw linseed oil,, mixed as a drench, and if the pain continued for an hour and a half repeat the drench only giving half the above quantities of drugs. An injection of warm water with a small quantity of soap dissolved in it; followed by giving the abdomen a brisk hand rubbing, would be beneficial. After the pain subsided small wheat bran mashes might be given until the bowels were acting naturally, then gradually increasing the food until fully recovered. Water should be given in small quantities, frequently, at first with the chill taken off. Regarding the the urinary condition, the retention of urine was due to contraction of the muscles around the neck of the bladder and is nearly always the condition during an attack of Spasmodic Colic As soon as the spasm is relieved the animal urinates, causing casual observers to suppose that the kidneys or bladder is the seat of the disease. As to rupture of the bladder, is must have occured some days after the commencement of disease or else

YOU DON'T NEED A SULKY PLOW—GET THIS TRUCK.



THIS truck under the beam makes an ordinary plow as solid as a sulky—takes the strain off the plowman's arms—makes it almost unnecessary to hold the handles—keeps the plow working at an even depth—makes the draught easier and more regular on the horses—makes it possible for a boy to plow as well as a man could. Anyone can put this truck on ANY plow in 5 minutes—you don't need to have one of our celebrated "B" plows to work it. The large 18-inch wheel runs in the furrow, regulating the furrow thickness and width; the small 12-inch wheel supports the plow when the plowing is too deep and the plow has a tendency to overthrow.

Remember, $5.00 will put this truck on YOUR plow—isn't that cheaper than a sulky? What's more, that price includes free delivery anywhere in Ontario, Quebec or the Maritime Provinces. Write to us for Catalogue No. 100 5

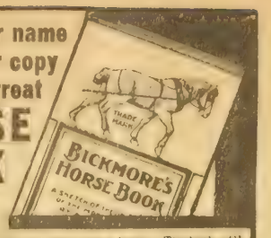
HORSE BOOK FREE



You want to know all about your horse. The book will post you. Breed, breeding, development, marketing, handling, treatment of diseases and ailments. A practical book that every farmer and horse owner should have. We want to send you a copy. Simply write and ask for it. We pay the postage. You will find it worth many dollars to you. In it Bickmore tells you how the old reliable stable remedy, Bickmore's Gall Cure, enables you to cure galls, cuts, sores, scratches and all of horses' worst ills and ailments while you continue to work the horse. Never necessary to lay the horse off.

BICKMORE'S GALL CURE

is guaranteed to cure while horse is under harness or saddle. The great action of Gall Cure—who sell it are authorized to return your money if it fails. Buy it and have it on your stable shelf ready for emergencies. It is the standard remedy of leading horsemen, trainers, large stable owners and veterinarians. Sample Bickmore's Gall Cure sent for 6c postage. Address

WINGATE CHEMICAL CO., Ltd., Canadian Distributors,
810 Notre Dame St. W., Montreal, Canada.

the animal would have been unable to urinate at frequent periods up to the 7th day. If the bladder had been ruptured to any great extent the urine would have escaped into the abdominal cavity and not passed out through the natural channel. The quantity of blood and water described as being in the abdominal cavity is always the post mortem condition in death from mortification of the bowels. The length of time a horse would live after rupture of the bladder is not known, the condition being so rare that reliable authorities do not state, and I never saw a case in a horse where death was due to this cause. The fact that the animal stretched as if trying to urinace is not always evidence of a bursted bladder, as horses will often act in that manner during an attack of constipation or colic, even placing their nose at the flank and moving it up toward the lions and moving it down to the flank when the kidneys and bladder are perfectly healthy. Such symptoms alone do not indicate disease of the urinary apparatus. J. STANDISH, V. S.

The life of Geneseo is much like that of other small western New New York towns, and it was recently decided to see if something could be done to develop more local interest in trade. A number of the merchants in Geneseo decided to combine and form a business men's association to advertise the town and help thecommunity.

A large number of the men decided that the thing to do was to arrange some method for bringing the people to town. It was decided, therefore, to try holding a free auction each month. Any farmer could send in anything he desired to sell, and the business men wokld advertise it, catalogue it, pay for an auctioneer to sell it and turn over the proceeds without any expense to the farmer.

At this time the different merchants arranged special prices on certain lines of goods, thus : seven cakes of soap 25 cents, or 19 pounds of sugar for $1.00. One enterprising jeweler on the first public auction day sold 500 solid silver thimbles at 17 cents each. As this auction was held before Christmas, he had all his Christmas stock arrayed around the store with special prices marked on each article.

The public auctions kept the farmers busy, horses, cows, tools and farm products attracted several hundred men. People who would not come to town for any reason came on market day, and those who did not come to purchase, came to discuss things and see what was going on.

The first market day was a decided success. The cost to the merchants was made up by a levy of $1. each on the members of the association. It has since been decided that they will contribute $1. each month and try the system for a year. The

second auction in January was held under unfavorably climate conditions, but was extremely profitable to the merchants and some $3000 worth of farm stock was sold, nearly double that sold at the first auction.

SEED SELLING A SUCCESS.

At the third auction, that of February, recently held, it was decided to add a new feature. Three weeks before the event, notice was sent to all the country papers that a seed distribution bureau would be established by the association. A committee outlined the following plan :

All farmers having farm seeds anywhere in the vicinity were invited to send samples with the amounts they wished to sell and the price. In the case of seed corn, they could bring ten ears, or half a peck shelled, half a peck of oats or beans and ten potatoes; also samples of grass, clovers and alfalfa seeds.

First, second and third prize cards were awarded in each class, the judging being done by Dr. Gilbert of the state college of agriculture at Ithaca. The act of placing samples in competition added interest.

Since the auction was not to be until after dinner, the morning was devoted to an institute, Dr. Gilbert giving an address on the importance of good seed. This allowed time to discuss the samples shown and to give in detail methods for their improvement. The exhibit and address were held in the village hall. On a bulletin board were posted the names of all people having produce to sell and of any person who wanted to buy, and the committee sought to bring the parties together.

In order that the farmers might see whether their soil conditions were similar, a soil map of Livingston county was hung up in the room, an advanced copy having just been received from the United States department of agriculture.—Orange Judd Farmer.

STOCK NOTES.

The New World's Butser Record For Thirty Days.—Chenango county, New York, now has the distinguished honor of producing the best cow the world has ever known, and comparatively few realize what that really means. For many years there has been great rivalry among farmers and dairymen as to who could or would at some future date have the proud distinction of owning a world's record animal.

The real name of this queen of all cows is DeKol Queen La Polka 2d, and her fortunate owner is Clayton Sisson of Sherburne, New York, a village just 12 miles north of Norwich. Mr. Sisson lives just about a mile south of the village so that if one cared to drive to his farm it would mean about 11 miles from the county seat. All of Mr. Sisson's herd are of the Holstein-Friesian breed and all his stock is registered. He has been breeding Holsteins for about five years and this animal he purchased from a neighbor sometime ago paying the sum of $175 for her.

The record made by this marvelous cow is as follows :

Butter record, seven days, was 35.34 lbs.

Butter record, 30 days, was 145.10 lbs.

Milk record, one day, was 124.00 lbs.

Milk record, eight days, was 841.8 lbs.

Milk record, 30 days was 3376.9 lbs.

Just reflect for a moment what this means—more than a ton and a half of milk from one cow in 30 days. There is only one cow in the wide world that has ever beaten any of the above records and that animal was Grace Fayne 2d's Homestead, owned by H. A. Moyer of Syracuse. She made 35.55 lbs of butter in seven days. Mr. Moyer was offered just $8,000 for this cow right after the test was made and in two weeks from that day the animal was dead, having contracted pneumonia.

The cow that has tested nearest the Sherburne animal is Colantha 4th's Johanna, and is owned by Mr. Gillett of Wisconsin. Her record is as follows :

Butter record, seven days, was 35.22 lbs.

Butter record, 30 days, was 138.54 lbs.

Butter record, one year, was 1248 lbs.

Milk recorp, 30 days, was 2,677.5 lbs.

Mr. Gillet was offered for this cow and her male calf the sum of $15,000, by D. W. Field of Montello, Mass., but the offer was refused.

The cow that previously held the highest one day's milk record was DdKol Creamelle, and she produced in one day just 119 lbs. of milk, but her butter record for seven days was only 28 lbs. She was owned by D. W. Field of Montello, Mass. When one stops to reflect that the average dairy cow in the state of New York, according to statistics gives only 3,000 lbs. of milk annually it seems this Chenango county cow has produced more than that quantity in 30 almost impossible to conceive that days. Stating it in another way, this Sherburne cow has given 124 lbs. of milk in one day, or 62 quarts. She gave 3,300 lbs, in 30 days, or 1,650 quarts. She is milked four times daily, at 5 and 11 o'clock. Mr. Sisson invites those interested to call and see the animal, but she can only be seen at the milking or feeding hours, as at all other times she must have her rest undisturbed.

DeKol Queen La Polka 2d is the proud dam of a male calf that is practically worth its weight in gold. This handsome fellow is four weeks old and a reporter heard Mr. Sisson offered $2,500 for the youngster Friday afternoon, but the offer was courteously declined. Although he did not so state at the time it is doubtful if any sum under $5,000 would tempt him to part with this promising youngster. He asks $10,000 for the cow and will pzobably get his price before many days have rolled away. She is six years old and for a part of the time while undergoing the tests was not in the best of physical condition. During

"Too Late—The Washing's Done. You Have Missed All The Fun"

The "NEW CENTURY" takes all the work out of wash-day.

It makes wash-day, the easiest day of the week to the woman who does her own work.

The "NEW CENTURY" —with its ball bearings, powerful spiral springs and easy action—enables even a child to wash a tubful of clothes in five minutes.

Why don't YOU learn more about the no-work way of washing at home? Our booklets tell the whole story. Write for them.

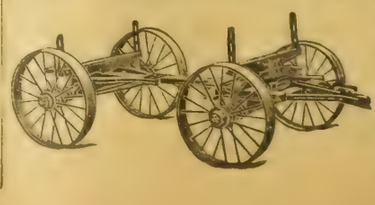
Save Your Blacksmith Bills.

Get more work and wear out of your wagon. Dominion Wagons are strongest, lightest, best material. Outlive 3 wooden ones, cost less. Do twice the work. Save time, money, labor. Easiest on horses. None so good. Change to platform pattern in few minutes. Equip your wagon with Dominion Wide Tire Steel Wheels instead of wood. Cold won't snap them. Easiest for rocky or muddy roads. Fit all axles. Cheapest, sturdiest. Send for catalog. No charge. Write now.



Dominion Wrought Iron Wheel Co., Ltd., Orillia, - - - Ont.

the test the animal was in what is known as an old-fashioned rigid stanchion and not in any one day did she consume more than 20 lbs. of grain.

The committee has decided to offer the above premiums in 1910 at Brockton Fair, Massachusetts; Illinois State Fair, Kentucky State Fair, Michigan State Fair, Minnesota State Fair, New York State Fair, Ohio State Fair, Oregon State Fair, Tennessee State Fair, Texas State Fair, Vermont State Fair, Virginia State Fair, Wisconsin State Fair and the National Jersey Show, Shelbyville, Ky.

Class 3.—Cow having an accepted record in authenticated test for one year; made according to the rules of the Club, which is awarded the highest number of counts, on the basis of 100 for perfect, by the official judge at such show, by adding to the counts allowed for conformation one count for each 20 pounds of butter-fat produced by the cow in one year over and above the minimum required at her age, no cow scored on conformation under 80 p.c., to receive an award. First, $30; second, $20; third, $10.

Class 4.—Four females over one year, the get of one sire, three of which must be in milk, exhibited by the breeder. First, $40; second, $30; third, $20.

Animals eligible to compete for these prizes must be recorded in the Herd Register of the American Jersey Cattle Club, and Certificates of such registration must be exhibited to the proper officers at fairs before such animals are entered.

Special Fair Premiums of the American Jersey Cattle Club.—At a meeting of the Board of Directors of the American Jersey Cattle Club held March 23, 1910, a committee of three was appointed, consisting of G. W. Sisson, Jr., chairman; M. D. Munn and T. F. Marston, to arrange for premiums to be offered for Jersey cattle at fairs.

This committee has formulated the classifications and awards stated below, to be offered by the Club at such fairs as the commitzee may designate:

Class 1.—Grand Champion Bull, exhibited by breeder. Gold medal (value, $20), suitably inscribed.

Class 2.—Grand Champion Female, exhibited by her breeder. Gold medal (value, $20), suitably inscribed.

Gavin Harding, Graham's Road, P. E. Island, took a half car of Holstein cattle from Ontario. The bunch included some of the best Holstein blood available in Canada. One heifer, the daughter of the celebrated Count Mercena Posch, having an official record of over 16 lbs of butter in seven days. All the females that had freshened were officially tested and the young stock are from high producing dams.

The PUBLISHER'S DESK.

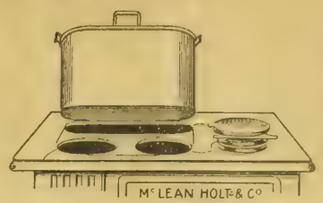
Golden Business' Opportunities.—"Golden Business Opportunities" is the title of one of the Grand Trunk's latest publications, issued by the Commissioner of Industries. It is a concise treatise on business openings in Western Canada, and contains a fund of facts and valuable information. A "Quarterly Bulletin" has also been issued, which tells of specific business openings in Western Canada for the cobbler or coal dealer, liveryman or laundry man, baker or banker, lawyer, doctor or general merchant. These publications may be had for the asking. Apply to J. Quinlan, D. P. A., Montreal, Que.

If You Want to Save Trouble on Wash Days, Then Buy a GLENWOOD RANGE.

Yes, when you have a Glenwood Range in your home, you can shift your wash boiler to the back of the stove by shifting the centres, as the cut shows. The Glenwood Ranges have been proven a success by the hundreds that are using them.

This cut shows section before changing.

We are getting enquiries for them all over the Maritime Provinces, which shows that the Glenwood Ranges are taking a hold through the provinces as well as in St. John, where they are made. We have the stoves that the people want and we neither spare time or money to make them just what we say they are.



This cut after changing.

We prepay all freight to your station. Send for our Catalogue. We have Ranges from $25.00 up.

MADE AND SOLD BY

McLEAN-HOLT & CO., - 155 Union St., - ST. JOHN, N. B.

Buying a Farm Wagon.—If there is any one farm necessity that requires more careful buying than the others—it is the wagon. You must be absolutely sure to get a good one, for it probably works harder, is put to more strain and is expected to last longer than any other farm necessity. So buying a farm wagon is a mighty important proposition with the average farmer, and a few words of advice here will not come amiss.

In the first place, don't let any low-priced wagon blind you to quality. If you can get a first grade, high quality wagon for a "ridiculously low price"—all well and good, but we doubt whether you will be satisfied with your purchase at the end of a year if you let price be your main guide to a choice. If you buy a poor wagon at any price, you pay dearly for it in the end. The real cost of a wagon is its repairs, the trouble and the wasted time it would surely have cost you with a poor wagon. Then there's a certain "pride of ownership," a certain keen satisfaction in owning a wagon you know will stand up under heavy loads, over rough roads, for long trips at a stretch. That sense of confidence costs you nothing when you buy a good wagon.

We repeat, don't let pride be your only consideration when you buy a wagon. Look to the quality first. Find out how it is made, what it is made of and by whom. The only way to get a good wagon is to investigate thoroughly before you decide. Paint, you know, makes wagons look somewhat alike when they are new—so don't judge by looks, either. Of course, you want a neat wagon—but neatness doesn't carry heavy loads, doesn't make a wagon light in draft, doesn't make a wagon last longer and doesn't show much after your wagon has weathered one or two long trips. So, after all, it's what's under the paint that counts. Let us consider the representative line of high Grade I. H. C. wagons, to impress our point more forcibly.

There's the Petrolia and Chatham Wagons that have built up their reputation because the materials used in their construction and the workmanship are of the best. Chatham wagons have hard maple axles, white oak rims, spokes and hubs, second growth white ash trees and yokes, oak or rock elm double trees and reach and white ash or oak tongues. This material is uried under cover and carefully inspected. As soon as the machine work is done on all the gearing, each part is soaked in boiled linseed oil so that every gear, mortise and tenon is properly protected. The wheels are given the same treatment before the tires are put on. The value of this construction has been proven by thousands of Canadian farmers.

Patrolia wagons have also proved an investment that pays big dividends in a lifetimes service to thousands of Canadian farmers. Their record is positive proof that it pays to buy a wagon whose wood material is selected with great care and thoroughly seasoned— whose iron work is designed to insure durability and strength and whose construction is in the hands of expert workmen. These wagons are in every way up to the I. H. C. standard of excellence. The many styles of I. H. C. wagon means the right choice to meet your requirements. Let the local International dealer tell you about the I. H. C. wagon that will suit you best. Get catalogues from him and read the many things that go towards making I. H. C. wagons so high in quality—so satisfactory in use. If you prefer, write direct to the International Harvester Company of America, at nearest branch house for the catalogues you are interested in and for any definite information. A postal card will do. Branches are located at Hamilton, Ont.; London, Ont.; Ottawa, Que., and St. John, N. B.

A Book Worth Reading Twice.—Books issued as an advertisement are often handsome and sometimes interesting. Rarely, though, are they both at once in any such degree as is the latest product of The Pedlar People of Oshawa, those "advertisers in plain English" with whose straight talks most of our readers are familiar. This progressive house has just issued a new edition of their famous booklet "Roofing Right," which is elaborately illustrated from actual photographs of farm buildings in all parts of the Dominion that have been roofed with Oshawa Shingles to the satisfaction of their owners and occupants.

The new "Roofing Right" contains forty-eight pages, magizine size, and is as complete a treatise of the merits and faults of all kinds of roofing materials as has probably ever been put between covers. When one had read it through there is little left to guess at on the question of roofing. The book is written in a frank, plain spoken way and must prove valuable to anyone interested in the choice of roofing for any building. We learn that the Pedlar People have a few copies remaining of the large edition recently printed, and we suggest to our readers the wisdom of applying at once for this valuable work, which is sent free and postpaid on request to any subscriber of this paper who mentions it when making his request. When writing ask for Booklet No. 17.

A Real Mineral Surfaced Roofing.—The new mineral surfaced type of roofings is one of the latest and best of labor saving devices for the farmer. The old type of so-called "rubber roofings" were inexpensive and easy to lay, and became very popular on that account. But they required painting every two years or so to keep them from leaking. Amatite Ready Roofing, which is the most popular of the mineral surfaced roofings needs no painting or coating of any kind. After it is laid the farmer can leave it strictly alone, and it will continue to give him uninterrupted satisfactory service year after year. A sample of Amatite showing the real mineral surface can be secured without cost by addressing a post card to the nearest office of The Carritte Paterson Mfg., Co., St. John, N. B., and Halifax, N. S.

How To Save Money Buying Wire Fences.—To Mr. E. L. Dyer, Manager, of the Crown Fence Supply Co., 47 Wellington St. East, Toronto is due the credit of being the first man in Canada to sell wire and iron fences and gates direct to the consumer.

Our readers will understand that this method of buying saves them a considerable sum of money and the big business which Mr. Dyer is building up all over the country is proof that people are appreciating his methods. One thing we like about his business is his "square deal" to everybody, and his "send-'em-back-if-they-are-not-right" guarantee.

We would advise all subscribers to write for Mr. Dyer's free Catalogue and prices because we feel certain that it would be to their advantage.

Free Sample of Amatite—the Roofing That Needs no Painting.—There are doubtless many readers of this paper who are users of ready roofing, who are not familiar with Amatite. This is a new type of roofing which came upon the market a few years ago and has found wide favor on account of its mineral surface which needs no painting. This mineral surface is embedded in pitch, which grips the stone firmly and makes a kind of pitch-concrete surface. This surface is abundantly able to withstand all sorts of weather year after year without any painting. Its price is no higher than that of the old-fashioned painted kinds. In fact, in many cases it will be found to cost considerably less. Next time you paint your roofs remember that painted roofings are no longer the only kind you can buy. In the meantime it is a good idea to look up Amatite. You can get full information and a free sample from the manufacturers on request. Address, The Carritte-Paterson Mfg. Co., Ltd., St. John, N. B.; Halifax, N. S.

1 Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only one cent a word, you can advertise anything you wish to buy, sell or exchange. The address must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issue. No black faced type or display of any kind will be allowed under this head, thus making a small ad, as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

WANTED.—Hides, calfskins, sheep and lamb pelts. J. J. McLEAN & SONS, Hopewell, N. S.

SHORTHORN BULLS for sale. WALTER EATON, Upper Canard, Kings, N. S.

WANTED—Woman or girl for general house work. Good wages. MRS ROWLAND FRITH, Mount Pleasant Ave., St. John, N. B.

GUERNSEYS FOR SALE.—Two yearling Bulls, one six months old Bull and several Bull Calves.—T. D. BLAIKIE, Great Village, N. S.

IMPORT Bulbs and perennials direct from Holland at quarter price. Get import list at once. MORGANS SUPPLY HOUSE, London, Ont.

WANTED.—To trade a new gasoline engine for second hand portable steam engine 8 to 15 horse power. Write describing engine to B. care MARITIME FARMER, Sussex, N. B.

SALESMEN WANTED for the best automatic compressed-air hand sprayer made; liberal terms; sample machine free to approved agents. —CAVERS BROS., Galt, Ont.

SITUATION WANTED by Englishman aged 42, to manage dairy farm or herd. Used to Jerseys, (pure bred), calf raising, butter-making, pigs, poultry. BOX D, MARITIME FARMER, Sussex, N. B.

ALL kinds of books on Poultry, Pigeons, Rabbits, Pheasants, Horses, Cattle, Farming, Gardening, Bees, Fruits Flowers, Vegetables, etc. Catalogue free.—MORGAN'S POULTRY SUPPLY HOUSE, London, Ont.

THREAD POWER FOR SALE.—I have a two horse Moody thread power that I will sell cheap and on easy terms. The thread power is in a good state of repair and has not been used extensively. For particulars, write "Power" care MARITIME FARMER, Sussex.

Can New Brunswick Grow Apples?

In looking around for a capable person to look after the horticultural interests of the province and to act as a general in marshalling the forces that were convinced of the opportunities offered for fruit growing in New Brunswick, the Department's choice luckily fell upon a young man of considerable energy, who has already proven the wisdom of the choice. Although not a native of the province he quickly recognized the posibilities for the raising of more and better fruit. He has visited nearly all parts of the province and from the indications pointed to by a rich soil, favorable climate conditions and the successes achieved by those who have given fruit growing a fair and square trial he is fully convinced that the time is not far distant when other provinces will need to look to their laurels in the race for superiority in fruit growing.

For many years New Brunswick farmers have been buying their apple trees from agents, who were in many cases, regular "Mouth Artists." Trees were bought that were supposed to produce fruit such as was depicted by highly colored plates in the agent's sample books. It made little difference whether the trees were suitable to the climate conditions of the district where they were to be set out or whether the fruit was of marketable quality or not. In many cases, when the trees came to bearing, if they lived to that age, the farmer found that the fruit was not in any way true to name. By buying in this indiscriminate way it was not uncommon to find that the trees sent out by larger and more important orders the nursery were the culls left after had been filled.

In order to counteract this annual occurrence of loss of time and money Mr. Turney, the Provincial Horticulturist, is ready and willing to take the orders of all those who wish to purchase nursery stock and by buying from a reliable firm in large quantities, he will be able to get a lower price, better quality and trees true to name. See an article by Mr. Turney in this issue and if you purpose setting out few or many trees let Mr. Turney get them for you. He will also be pleased to give you proper instructions re planting the trees.

At the Annual meeting of the New Brunswick Fruit Growers' Association held in Fredericton last winter, it was proposed that a Provincial Fruit Show be held in St. John before the close of navigation on the St. John River. The department of Agriculture has taken action re the proposition and we now have a copy of the prize list for the proposed show which will be held during the first week of next November on a date to be announced later. If interested in better fruit and think you tributing some of your fruit and joining in the competition send to would like to help the show by con- Mr. A. G. Turney, Fredericton, N. B. for a copy of instructions and prize list. It contains some valuable information. Just drop a card to Mr. Turney today lest you forget and as a reply to the questions::

"Can New Brunswick grow Apples?

Can New Brunswick grow High Quality Apples?

Can New Brunswick grow commercial quantities of apples?

And can New Brunswick grow keeping apples?"

Exhibit Your Fruit.

Charlottetown Prices.

Grains.—Oats 34c. to 42c.

Feedstuffs.—Retail; Bran $1.20, Shorts $1.30, Middlings $1.40, Oil-Cakes $2.25 to $2.50; Corn Meal $1.50 to $1.80.

Live Stock.—Butcher's cattle 5c. to 6c., Stockers, not sold by the pound here; Milch Cows $35.00 to $50.00; Sheep 4½ to 5c; Lambs $2.50 to $3.00; Young Pigs $5.00 to $8.00 per pair.

Dressed Meats.—Beef (Carcass) 9½c, to 11½c; Mutton (Carcass) 9 to 10z; Veal (Carcass) 4c to 5c.; Lamb (Carcass) 13c. to 15c; Pork, None offering.

Dairy Products.—Creamery Butter solids 23c., Prints 23½c.;; Dairy Butter 17c, to 19c.

Poultry and Poultry Products.—Eggs 15½c to 16c; Fowl 12c.

Vegetables.—Potatoes 22c to 28c.

Miscellaneous.—Hay $10.00 $10.50; Straw $6.00 to $7.00; Wool 22c to 25c; Beef Hides 8c to 9c; Calf Skins 10c to 12c; Sheepskins $1.25 to $1.40; Lamb Skins 15c to 25c; Cowhangs 70c to 80c.

Market Review and Forecast.—Trade in general has been fairly good since our last report but the produce markets are still in rather bad shape. There is very little oats offering and price varies according to demand for local use. For shipping dealers are not willing to pay over 34c to 36c for white, but black is at a premium, selling at about 40c to 42c for export. The limited supply offering is being used for local consumption at about 40c to 42c for white and 44 to 48c for black. Potatoes continue without any special interest but the supply in the farmers hands is daily dwindling down and we think there will be very few potatoes sold if the price does not improve as farmers will not bother shipping them at all. Hay is also quiet the prospects of a large crop has increased the offerings and we look for no higher prices. Other lines are about steady. Creamery Butter is offering freely and prices are likely togo lower. Dairy Butter is likely at the bottom. The first meeting of the Cheese Board will be held tomorrow and it is only a guess with us yet what the price will be. The make for the first half of June should be heavy.

Peerless Lawn Fence

Is Strong and Attractive. All the wires are uniformly crimped, large gauge, steel spring wire, heavily galvanized and coated with white enamel paint. Never sags, never rusts. Improve your property with a Peerless Fence. Cheap as wood and more handsome and durable. Also full line of farm and poultry fence and gates. Write for information.

Fighting Weeds.

It is true, says John W. Chamberlin, that fighting weeds is not as common as it should be, and the work is not done as thoroughly as it should be. How often have I seen an effort made to destroy some weed by putting a hoed crop on the land and then find here and there all over it just enough of the weeds left to seed it all again. This is quite common with the daisy and the field mustard. It takes time to follow up the cultivator or the plow and make a finish of these specimens that are undoing all the work undertaken, but it must be done if there are to be results.

For this reason I have always doubted the utility of the summer fallow. It is so easy to let a few weeds grow.

Better put in a crop that will make war on the weeds by growing up and smothering them. I have never seen aa natural growth that would withstand a thickly-sown crop of buckwheat. It takes full possession of the ground and is urged on so fast by a little top dressing of manure that nothing will outgrow it. Buckwheat is somehow an unpopular crop, but it is so valuable for the one purpose —fighting weeds—that it should be sown much more than it is. Potatoes are generally worth much more as a weed-fighter than other hoed crops are, on account of the ground being dug over late in the season and in sections where two crops can be grown it would be easy to keep the soil moving often enough to kill all weeds that escape the regular cultivation or hoeing.

Weeds are queer plants in many respects. One sort or another often remains in a locality in an obscure way for an age and then springs up and makes an effort to obtain the mastery. There is in such cases some change of soil to account for that. In my boyhood days we were always fighting sorrel and spurrey, the latter seldom thought of as a weed now. I am convinced that the sorrel was so rampant because of an excess of acid in the soil and there must have been something there that attracted the spurrey, as both ceased to be troublesome after a few years, soil conditions changing with continued cultivation.

We are the great weed sowers ourselves. This is so well known to all cultivators that it will not need to be said as a matter of information. The professional cleaner of seeds is a benefactor of the race if he knows his business and he is not employed as much as he should be. The usual seller of seeds is a seller of a large percentage of seeds that are going to rise up and do us injury. I have pondered that fact ever since we seeded a large field to timothy and found next year that it was well towards half plaintain! And that plantain stayed with us till the field was plowed again, no doubt scattering its seed all over the farm.

It is the good farmer who is farthest out of reach of weeds. If all were good farmers there would be little to complain of. Still I repeat that I do not believe there is much need of going out of one's way to fight weeds. There is the natural enemy of most weeds in easy reach. Smother crops are better than hoed crops, and there are not many weeds that sheep will not eat, perhaps none that a goat will not, yet many farms are without either. There would be no wild carrots if sheep could get them. There would be no ragged growths if a few goats were kept.

Breeders Directory

Our charge for inserting names in this Directory is $1 per year for each line under each heading. Money must be paid strictly in advance. Names taken out promptly when time is up. Stamps taken.

FARM DRAINAGE OPERATIONS.

By E. S. Archibald, Agricultural College, Truro, N. S.

THE following article on "Farm Drainage Operations," by E. S. Archibald, Truro, N. S., appeared in Professor Cumming's 1909 report as Secretary for Agriculture in Nova Scotia. While Mr. Archibald wrote this article with special referenec to Nova Scotia conditions, the need for underdrainage is so prevalent in all the Maritime Provinces that the instructions given warrant our reproducing the article for the benefit of all those who are not fortunate enough to annually receive Professor Cumming's reports :

Many farms in Nova Scotia are naturally well drained, but on the majority we see the great need of some artificial means of drainage. Of this latter class many have already been converted into the most productive lands by a thorough system of underdrainage. Why has not the practice of underdrainage spread more rapidly as its financial benefit would warrant ? The reasons might be summarized as follows : Insufficient knowledge of drainage operations, insufficient knowledge of the cost of drainage, and, finally, the initiative power to overcome criticisms and obstacles. The first is by far the most important and will be the chief consideration of this article.

Drainage operations in eastern Canada present many peculiar and difficult problems. The higher lands are of a hilly character, and consequently more or less springy. Enclosed in theee hills we find extensive tracts of bogs, varying in size and character, but all enclosed by a higher surrounding ground. Take, for example, the Agricultural College Farm, at Truro N. S. This farm, rising sharply from the Salmon River, contained a series of swamp holes extending up through the centre, each bog several feet higher than the preceding one, yet enclosed by a crown of earth which prevented natural drainage. By the aid of a careful system of drains, laid out by Mr. F. L. Fuller, then Farm Manager, and carried out by his successor, Mr. S. A. Logan, these areas, once useless, are now our most fertile fields.

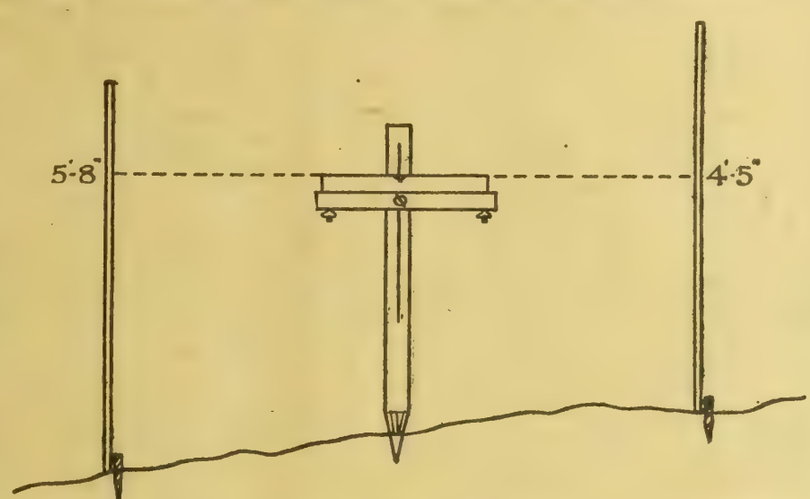

Fig. 2.—Home Made Drainage Level, showing method employed in using it.

Again, our soils vary greatly, which adds many difficulties. Marsh drainage is a problem of different nature and new aspects. Nearly all these areas can be drained profitably, and in most instances the tile underdrain must eventually predominate. Many failures have occurred in the past through ignorance, carelessness, and lack of systematic procedure.

PRELIMINARY SURVEY.

In fully fifty per cent. of cases in our upland drainage the most essential point is to determine the outlet. This done, a natural system of drains, i. e., the main drains, sub-drains and laterals, following the natural water course, is easily installed, and the system is ideal. Much money has been wasted, however, on mistaking the outlet and the economy of making an extended survey is apparent. The character of the soil is another essential to the preliminary survey. The natural course of the drains to the outlet must also be considered, always holding in mind the following precautions : 1. Lay main drains in line of natural drainage. 2. Lay lateral drains in line of greatest slope. 3. Avoid short laterals. 4. Run laterals directly up grade, rather than diagonally to a spring. All these points are self-evident to the experienced drainer, or the intelligent beginner.

EXTENDED SURVEY.

On level or slightly rolling ground apparent elevations are often deceiving. Many mistakes in locating the outlets, and systems of drains have been made during the past, by using the unaided eye in a general survey. This extravagance and inefficiency soon became apparent and now the surveyor's spirit level or transit has been adopted to find the exact lay of the land. Space will not permit of a detailed account of these operations, but we might briefly summarize as follows : The field under consideration is partially staked off into one hundred foot squares, the transit is set up within reading distance of as many stakes as possible, and the surveyor takes readings on the graduated surveyor's staff, or speaking rod, at each of these stakes. Exact notes of all readings are kept and are figured to a common basis, thus giving comparative elevations of all points of the field. These elevations are then chartered, and the system of drains accurately laid out on the chart. This is a simple operation, requiring slight experience, but accuracy, patience and the expensive surveyor's instruments. Where such operations are needed, it would pay the farmer to hire a surveyor. I am pleased to state that a very worthy movement is now on foot to supply Government aid in such matters, having a man who is both a good surveyor and a drainage expert.

The home made drainage level (Figure 1) may be used for a similar purpose, but it is of greater accommodation, accuracy and use in surveying the drains after being located by either preliminary or extended survey.

STAKING OUT THE DITCH.

Having the ditch located, it should be staked out with several 6 foot stakes which guide in opening the ditch with a plow. Then starting at the outlet (as in digging) measure the drain with, say a 100 foot tape. At each 100 foot mark drive a short guide stake one foot from the ditch, marking on it the distance from the outlet and later the depth of ditch at that point.

DETERMINING FALL OVER DITCH.

Again starting at the outlet we use the home made drainage level. This instrument consists of : 1. An ordinary carpenter's level (L.) 2. The wood is 3x1½ inches plained pine. 3. The upright is 5½ feet long, with a 2½ foot slot. 4. The cross piece 2 feet long is bolted to the upright and washered at nut and head. 5. The wood screws, with thumb heads, pass upwards through a cross piece to touch the bottom of carpenter's level, thus aiding in making this instrument perfectly level without disturbing the support. 6. Two iron buttons on cross piece hold the level secure against the upright.

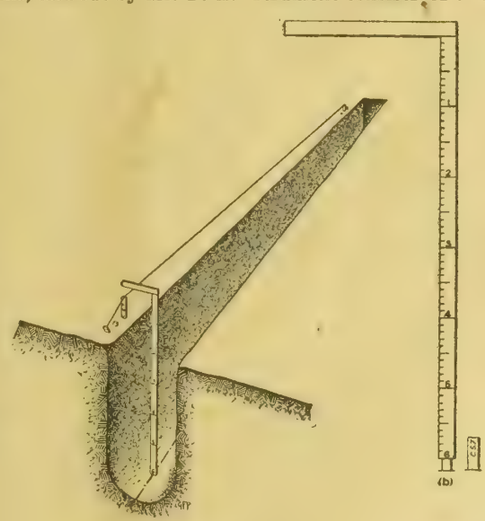

Fig. 4.

This instrument is firmly punched into the ground, about half way between the stake at outlet, and the second stake, and then carefully leveled. One man holds the graduated staff at stake No. 1 whilst the other sights over the top of level, and, as in figure 2, finds it level with the 5 foot 8 inch mark. The staff men then changes to stake No. 2 and the top of level here sights to 4 foot 5 inches; hence there is a rise of 1 foot 3 inches in the first 100 feet.

Accurate notes are kept as follows, these notes being taken by students during a survey at the College Farm at Truro :

NOTES ON MAIN DRAINS.

Stake.	Back Sight		Fore Sight.		Fall.		Rise.		Elevation	
	Ft.	In.	Ft.	In.	Ft.	In	Ft.	In	Ft.	In.
1 (at outlet)	5	8	.....		.....		.....		10	.....
2.	5	9	4	5	. . . . .		1	3	11	3
3.	4	11	5	1	.....		 8	..	11	11
4.	5	1	4	2	.....		... 9	..	12	8
5.	5	2	5	4	.....	3	..	....	12	5
6.	. . . . .		5	10	.....	8	..	....	11	9

N. B.—The elevation of stake 1 was taken as 10 feet from an imaginary horizontal plane, commonly called the datum plane, from which to work relative observations. (See Fig. 3.)

Peep sights (P, Fig. 1) used on top of level make sighting work more accu-

rate. These are manufactured by H. Occomore, of Guelph, Ontario, and we would recommend them for use, especially in hot summer weather.

DETERMINING THE GRADE OF DITCH.

To one having experience in underdraining, the value of determining the fall over the ditch is of unquestionable importance and value, especially on comparatively level tracts where every inch of fall must be saved. But the question of uniformity and trueness of grade is even more essential, and these preceding steps lead to a series of easy methods which must, if carefully preformed, give accurate results. The average farmer finds his chief difficulty in determining the grades of his ditches so that he may not go too deep, or too shallow when cutting through uneven ground; hence is given below a common method by which he may work out all grades of ditches from date previously taken in determining fall over ditch. The illustration (Fig. 3) might be briefly explained in its various steps, as follows:

1. Obtain a piece of Co-ordinate or Surveyors' Cross Section paper ruled in one inch and one-tenth squares.
2. Fix the imaginary datum plane.
3. Let one inch equal five feet in elevation and mark in the outlet.
4. Let one inch horizontally equal one hundred feet and mark in the stakes on datum plane with elevations at proper distances above
5. Jointing these elevations we have a profile of the ground surface.
6. As protection against frost, we would dig at stake 6 not less than 2½ feet and for effiency at the outlet, say 3 feet. Since one inch or ten spaces equals five feet and one space or one-tenth of an inch would represent 6 inches in eleration, hence 5 paces represent 2½ feet.
7. After marking these two points, stake 1 and 6, place a rule on them and dot the imaginary ditch bottom. We note that at stake 4 we are nine spaces, or 4½ feet from the ground surface and we would look for some cheaper, and, if possible, as efficient ditch. If possible, we must in tile draining have a fall of 2 inches per 100 feet.. With the uniform grade (dotted line, figure 3) we have four spaces, or 24 inches fall in 500 feet, or 4.8 inches per 100 feet. Hence, by making the grade slower we may cheapen digging and still have very efficient drainage. A careful study of figure 3 would make this problem clear and show its marked advantages. Other instances might ne sighted where this method is unexcelled; take for example a perfectly level stretch, by thus charting we may find our available fall when natural fall is nothing. After these operations mark depth of diggings on guide stakes.

DIGGING.

The most of our digging in Nova Scotia, is now done by spade, or shovel and pick, but under average conditions this is too expensive. Plow may be used to greatly cheapen the digging.

1. With an ordinary plow open the drain eighteen inches wide, throwing furrows outward. Now throw two furrows together in the bottom of started ditch, and shovel out. Continue this second operation as long as possible by widening the lines, using a long double-tree, one horse being on each side of the ditch and a six foot chain extension to the beam. We may comfortably loosen the earth by this means to a depth gf eighteen inches. It is now necessary to have something which will dig a narrower trench. An ordinary subsoil plow is good for this purpose, plowing up and down in the centre of the trench. Lacking this instrument, we may readily remodel an ordinary plow, as follows: Remove the mould- board and bolt a narrow block between the handles,

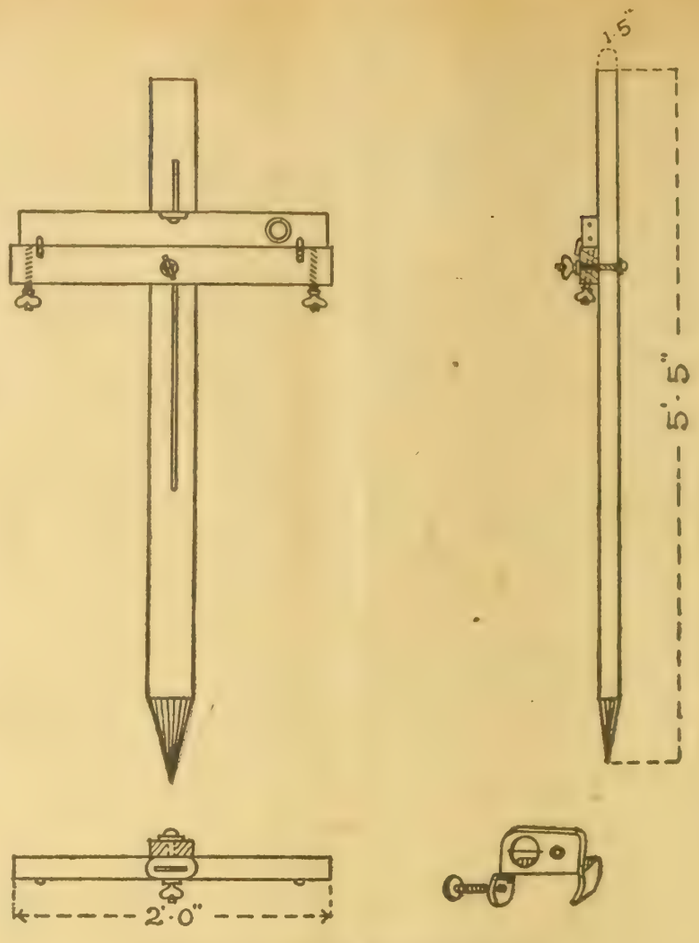

Fig. 1—Home Made Drainage Level.

running a brace from it to the back bolt in the beam, thus steadying the handle. Put on a new narrow point, and narrow the handles by shortening the rod. This makes a very useful and serviceable instrument. On some of our sandy soils the use of the plow is unnessary, but on average loam and clay soils, a man can by using such means throw out fully one half more per day with greater ease.

GRADING THE DITCH.

The usual method of grading the ditch bottom with running water is very good, but even here there are objections. During the mid-summer months we are, as a rule, unable to obtain this supply. This method leaves many chances for carelessness A great many ditchers think that providing the water will run in the open ditch, the underdrain will be fully as efficient. This often leads to trouble. The grade of an underdrain must be uniform, as sudden changes from a steep to a slow grade, invariably means sedimentary deposit in the tile. Hence, these greater or lesser uniformities must be either prevented or provided for. For the latter, such a drain coming down a steep grade to a slow grade, silt boxes and catch basin (preferably of cement) are essential. For the former the following method might be recommended.

An old method of grading the ditch bottom with the boards and carpenter's level is still much used. This was a step in advance of the use of the unaided eye, or even of flowing water, but the board is a clumsy article, especially if as long as to insure perfection. Even in the best of hands it is not perfect, and allows many chances for errors, and only this year I saw such an example. By levelling over the laid tiles in said ditch, with the home-made drainage level I found a marked lack of uniformity of grade, in some places the tile grading in opposite direction from the natural flow. This ditch, I must confess, was a difficult proposition, but the drainer was both experienced and careful, and had he used the following method the operation would have been more simple and efficient.

By the use of the plow we may suppose the ditch of figure 3 to be dug within a few inches of the bottom. At the outlet, stake 1, where the drain is to be 3 feet deep, drive a stake 6 inches from the edge, having 3 feet of the stake above ground. At stake 2, where the drain is also three feet deep, repeat this process. Draw a line or wire tight and straight over the tops of these two stakes, and anchor the ends to pegs or weights. You will see that all points on this line must be exactly 6 feet above the finished drain bottom, however irregular the ground surface may be between stakes 1 and 2. As a guide in digging, cut a piece of 2 by 1 inch board 7 feet long. Toward the upper end of this nail at right angles and brgce a 2 foot cross piece at such a height that when the upright is stood on end the lower edge of cross piece is exactly 6 feet from the ditch bottom, In digging, this answers splendidly as a guide, it just touching the upper edge of the cord when the proper depth is obtained, see figure 4. In driving these line stakes, say at stakes 3 and 4, we know at stake 3 the ditch is to be 3 feet 6 inches deep consequently we will drive the stake so as to have 2½ feet above the ground, thus making the top stake 6 feet from ditch bottom. At stake 4, the ditch will be 4 feet 1 inch deep, hence we wish but 1 foot 11 inches of stake above the ground, and all points on the cord will be exactly 6 feet above the finished ditch bottom and the uniform grade obtained.

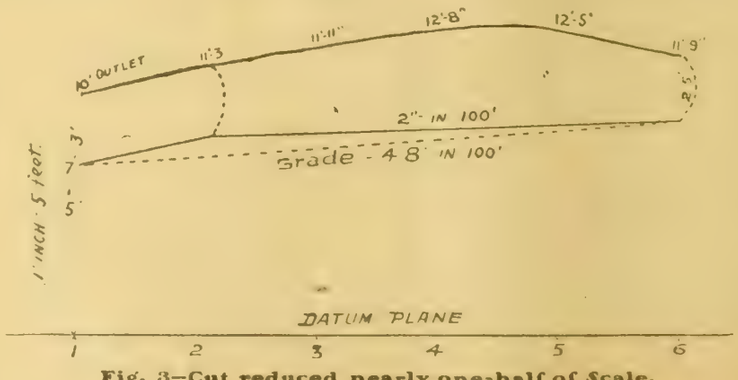

Fig. 3—Cut reduced nearly one-half of Scale.

LAYING TILE.

Through land of swampy or quicksand character it is always necessary to lay the tiles on boards. The precaution, such as joining the tiles evenly and tightly, and filling of 6 inches of earth over the tile, as a lid, to retain this evenness, are self-explanatory. Under average conditions, nothing is needed over the joints of tiles, but in cases of emergency tar paper, gravel, sawdust, etc., may be profitably used.

It is unwise to allow the digging to get too far ahead of the laying and filling. A rain at this stage does serious damage in caving the sides, or running sediment into the tile already laid. To prevent this, the following precautions are useful: Place sods at the tile joints immediately after laying, followed by a few inches of earth. Tightly plug the upper end of the tile at the close of the days work, or before a heavy storm, complete the filling of drain as soon as possible. This latter operation may be greatly cheapened by the use of horse power. Plowing in the dirt is a very common practice. A V-shaped wooden scraper is splendid on sod land, and I have found the ordinary horse scoop or shovel as good as any. With a steady team on one side of ditch and chain extension to the scoop on the opposite, a man can fill over five times as fast as by hand. After completing the drain, it is often wise to plow a high, narrow land with the drain top as the centre. This prevents surface water collecting over the top of drain, or from washing out the newly-filled dirt. Remember that one tile filled with sediment or gullied out of line by above means will spoil the efficiency of the whole system. If a relief surface drain is needed after the ditch has become thoroughly compacted, make this shallow, say a dead furrow about two feet, on one side of the tile drain. Occasionally we note the need of catch basins to prevent surface washing during heavy storms. These, as silt boxes, must be, at least, one foot deeper than either the incoming or outgoing tiles, so that sediment may have a chance to settle.

(Continued in Next Issue.)

The world's most sucressful medicine for bowel complaints is Chamberlain's Colic, Cholera and Diarrhoe Remedy. It has relieved more pain and suffering, and saved more lives than any other medicine in use. Invaluable for children and adults. Sold by all dealers.

Nova Scotia Farmers Visit the Agricultural College.

For several years it has been customary for the farmers of the Annapolis Valley counties and the counties bordering on the Intercolonial Railway in Nova Scotia to hold an annual excursion to the College Farm, Truro, where they enjoyed a social picnic, interspersed with lectures by statesmen and agricultural experts, saw the well kept stock of the Farm paraded before them and inspected at will the various buildings, machines and growing crops.

Last year these counties arranged to meet on the college farm on the same day and it was, indeed, a grand sight to see such a large, well groomed, respectable concourse of representative farmers, their wives, their sons and their daughters. This year, the arrangement was somewhat different. The Annapolis Valley farmers' excursion being held on Friday, June 24th and that of the other counties on Saturday, June 25th. The weather was all that could be desired on both days and numbers far in excess of those of other years attended.

As the various groups arrived at the farm they sauntered hither and thither, first through the college building and then to the various stables, pens, poultry houses, implement sheds and finally wandered off to the expermental and field crop plots on various sections of the farm. The College Farm consists of about 210 acres: 100 of upland, 50 of intervale, and 60 of marsh. Of the marsh, 8 acres are in oats and the balance in hay. The intervale is entirely devoted to pasturage. Of the upland, about 30 acres are in oats, 2 in barley, 8 in corn, 10 in roots, 1 in potatoes, 12 in hay, 2 in green feed, 3 in orchard and garden, and 1 in a forestry plot. The balance comprises the College campus, barn and poultry buildings, with attached grounds, and uncleared land. Of the cultivated, described above, 7 acres

Buckeye Traction Ditcher in operation on the College Farm

of grain, corn, roots, potatoes, etc., are devoted to variety and culture experiments. Besides, 22 acres of the crops are under fertilizer tests. Nothing but commeendation could be heard of the various things inspected. The professors and assistants, in charge of the various departments of the college, were at their posts to answer questions and give full information re the methods pursued in conducting their respective branches of the farm work.

Lunch was served on the grounds after which the sight seers were given the opportunity of seeing a parade of the College Standard Breds Hackeneys, Thoroughbreds, Clydesdales, Shorthorns, Ayrshires, Holsteins and Jerseys. Dr. Standish oointed out the merits of the respective horses and Professors Cumming and Archibald explained the merits of the different cows of the various breeds shown. Following are some of the records of cows kept on the college farm as they appear in a cilcular distributed for the information of the visitors :—

Breed	No.	Milk Produced 1908-09	Milk Produced present year to date.	P. centage Fat in Milk
Ayrshire	1	11½ mos., 10,215 lbs	97 days, 5,173 lbs	3.7 to 4.5
"	2	9½ mos., 9,894 lbs		3.4 to 5.1
"	3	12 mos., 11,465 lbs		3.1 to 3.8
"	4	12 mos., 12,273 lbs		3.1 to 3.7
"	5	12 mos., 7,973 lbs	148 days, 5,984 lbs,	3.3 to 4.2
"	6	11 mos., 7,756 lbs		3.4 to 5.9
"	7	(2 year old heifer),	223 days, 3,921 lbs	4.1 to 5.0
"	8	" "	207 days, 5,243 lbs	4.0 to 4.8
Holstein	1	10 mos., 10,291 lbs	89 days, 3,941 lbs.	2.7 to 3.5
"	2	9 mos., 12,826 lbs	141 days, 9,181 lbs	2.9 to 3.4
"	3	11½ mos., 14,154 lbs	160 days, 8,286 lbs	2.7 to 4.3
"	4	11 mos., 11,095 lns	118 days, 6,111 lbs	3.0 to 3.7
"	5	12 mos., 11,990 lbs		2.7 to 3.4
"	6	(2 year old heifer),	147 days, 4,151 lbs	3.3 to 3.4
"	7	" "	92 days, 2,485 lbs	2.8 to 3.0
Jersey	1		237 days, 8,255 lbs	3.9 to 5.6
"	2	11½ mos., 6,368 lbs	145 days, 5,055 lbs	4.1 to 5.4
"	3		282 days, 6,770 lbs,	3.6 to 4.7
"	4		148 days, 4,426 lbs	4.3 to 4.7
"	5		301 days, 4,754 lbs,	3.8 to 5.2

Valuing milk at $1.00 per cwt., or butter at 25c. per pound, these cows have made a profit of from $30.00 to $50.00 each, not including the extra value of the calves produced from such utility animals. Cows of this sort will prove the most efficient means of economical production of milk and butter and will make dairying, which here-to-fore has afforded a comparatively small margin of profit, one of the most valuable industries of the country.

With the exception of a few Shorthorns, none of the stock is offered for sale at the present time, but considerable will be sold during or after the Short Courses in January, 1911.

"After the college cattle were shown Postmaster Blanchard's herd of 22 dairy cows, mostly grade Ayrshires were driven into the ring and a good looking lot they were. Mr. Blanchard has a small farm adjoining the college grounds. The milk he sells at the door. But let him speak for himself. He was the last speaker, a farmer to farmers. He told about his herd and what he got from them. He said the accounts were open to anyone to examine and they would show that he made, year after year, $1,200 net profit from his herd of cows.

The addresses on live stock were interspread with addresses by some prominent statesmen and others interested in Agriculture.

One of the interesting features of the two days was the operation of the new ditching machine which had just arrived, under its own traction power, at the dollege farm, from Shubenacadie where Supt. Fuller had completed ditching contracts that showed the merits of the machine. The machine was started behind the new implement shed and its work was much admired by all those interested in land drainage. We believe the employment of this machine will solve the drainage problem and will be of immense benefit to the agricultural industry of Nova Scotia in particular and the Maritime Provinces in general.

As a rule farmers are rather conservative in their ideas, re the advisability of buying expensive machinery of this kind, but, when the merits of a certain machine are exemplified to them, the progressive ones do not hesitate to launch out and put in the field machines for their own use and which their neighbors may also use for a nominal fee. It is delightful to see such large numbers of people meeting to discuss and inspect modern agricultural methods irrespective of political strife or creed.

In the poultry department, Prof. Jos. Landry was kept busy, among the feathered stock, explaining the proper methods to practice, and appliances to use, in poultry culture.

About four o'clock the picnicers returned to the railway station where they witnessed exhibition runs by the Truro fire brigade, after which they repaired to their respective trains feeling that the days had been well spent and that they had gleaned some valuable ideas that they can sooner or later put into practice, on their respective farms. They felt that the social intercourse with fellow farmers had been highly beneficial to all concerned and that Principal Cumming and his effecious staff were the most courteous officials one would care to meet.

WE WANT TEACHERS OF THIS KIND.

In a recent issue of Wallace's Farmer, Henry Wallace, its veteran editor, tells what he saw in the way of a practical farm school while visiting in various parts of Michigan. The teacher, a genus young woman, who was teaching agriculture in a way that was very impressive. He says:

"What most delighted me, however, was the opportunity to visit a genuine rural school, out in the country, that has perhaps twenty or thirty students and is taught by a farmer's daughter whose heart and soul is in her work. She had in one corner of the school house, perhaps half a wagon-load of soil for the purpose of instruction. I was particularly fortunate in arriving there at a time when she was teaching a class of children of the sixth or seventh grade. One boy had been taken by his father from the high school and put in this rural school, believing he could get a more practical education there than in the high school. The class numbered some eight or ten. The teacher was using a text-book of which I had never heard before, having each child read the questions, then elucidating the questions by questions of her own. I have never seen a class in any school anywhere that seemed to be more deeply interested or more eager to ask questions than some of these "kids," who knew more about the soil and crops than the average farmer—instruction which must prove an untold blessing to them in the future, whether they be farmers or farmers' wives.

"What a fortunate thing in after-life it will be for those farm boys and girls that they have had the inspirational touch and contact with that young woman. Who says that the farm intellect of this country is not awakening when such things are possible? Twenty-five years ago it would have been impossible to find such a teacher or the pupils, or the farm community which would consent to such a school."

THE BULL IS THE FOUNTAIN HEAD.

It is well in every spot and place in this world, to exercise all the plain, common sense we can. This is eminently true of breeding dairy cattle. All sorts of theories will greet a man as he enters this field, but there is one principle that will carry him through safely if he will but follow it. That is, to always consider the bull as the fountain head.

Spare no expense to get the best bull obtainable every time you purchase. Follow this rule just the same with a grade herd as you would with a pure bred. One great reason why you see so many poor grade cattle is because farmers have so generally followed the idea that any sort of a bull would do for a grade herd.

It will be impossible to keep back the work of rapid improvement in any herd if the owner follows strictly the rule of buying the best bull he can get and weeding out the poor cows. He will be astonished at how quickly the yield of his herd increases if he follows this plan.

BILL NYE'S COW.

Bill Nye is credited with having actually advertised a cow with which he had had an unfortunate experience, as follows :

"Owing to ill health, I will sell at my residence, in township 19, range 18 according to the government survey, one plush, raspberry cow, eight years old. She is a good milker and not afraid of the cars, or anything else. She has undaunted courage and gives milk frequently. To a man who does not fear death in any form she would be a great boom. She is very much attached to her home, at present by means of a log chain, but she will be sold to anyone who will use her right. She is one-fourth shorthorn and three-fourths hyena. I will also throw in a double-barrel shotgun which goes with her. In May she generally goes away for a week and returnes with a tall red calf with wobbly legs. Her name is Rose."

It would be a good thing if all advertisements were equally honest, if not as genuinely humorous.

PROVIDE SHADE.

Provide good shade, housing the stock during the day if necessary in darkened stables through which fresh air passes and in which stock will be less annoyed by flies and can be conveniently fed some grain and dry roughage or some soiling crop. No one would allow his animals to stand out doors in winter to starve and freeze to death and no sooner should one allow them to stand out in the summer to starve and burn to death Supply plenty of pure, fresh water and the best feed available from the crops which you had foresight enough to sow earlier in the year to tide over the short pasturage season.

SCIENCE AND COMMON SENSE.

The men who handle cows, are rarely scientific in their knowledge or judgement in regard to the animal or the conditions that surround her. Yet, if they are reasoning, observing men, they have a chance to learn a great deal. We hear a great deal among such men about "common sense;" which, if you understand it, means the sense they have. What is common sense? We spent a week once, in hard study to define it and yet it is a thing that is on the tongues of men continually. The best definition we could work out was the following :

"Common sense, is the widest understanding possible, of the relation of common things and our relation thereto."

The things to be judged are the facts. In order to exercise common sense about common things we must know as widely as possible all the facts which affect these common things. Do we know them? If not, we can exercise this needful judgement called common sense.

What is science? Nothing but judgement based upon a knowledge of the facts. Does the scientist know all the facts? If so, he is the more completely a scientist. Wherein then does science differ from common sense? Nowhere, providing a knowledge of the facts and laws which govern their action is had. Some scientists excell others in strength and accuracy of judgement; they understand better the meaning and action of the facts they know. It is just the same with common sense. The same knowledge does better with one man than with another. This differegce lies in the power and force of judgement.

Now the men of true common sense will never be heard sneering at science. His judgement tells him that scientists have had the opportunity to look farther into the facts. He respects knowledge wherever he finds it.

He knows that though the cow, for instance, is a common thing, yet she is surrounded by a vast number of facts that cannot be looked into and studied except in the light of science. Take the action of bacteria in milk ; in the food of the cow ; in the diseases which affect her which are nearly all of bacterial origin ; in her surroundings. These organisms, so minute that they cannot be seen or studied except by the aid of the microscope, cause wonderful change in all life. Indeed they change life to death. How shall common sense, unless aided by science, understand them and provide against their destructive action?

The farmer must cease sneering at science. Indeed no really intelligent farmer does that. He must see that scientific knowledge is simply his knowledge carried further. Of course mistakes will be made, yet the scientist makes less than the common man because of his greater training in careful weighing of the facts. Science has done wonderful things for the dairy farmer and agriculture in general.

BREEDING TYPE.

When the type has been established in a herd it is also desirable that the sire and dam be as nearly alike as possible, in which the sureness of their ability to reproduce their good qualities in their offspring is increased and retrogression guarded against. All of which goes to show that it is necessary to have a fixed plan if one shall realize the most out of his work for better animals. The improvement is greatly retarded if the cows one year are bred to one breed and the next year to another breed, and the improvements cannot be expected at all if the cows are bred to bulls of unknown breeding or ancestry. That sort of breeding or crossing should be dis-continued, and the sooner the better. Breeding within a certain breed is always to be preferred.

EDITORIAL NOTES.

The milk of every cow should be weighed and a record kept, and the milk should be tested by the Babcock test twice a month. You will never know the true value of each cow in your herd until this is done. To do it will require a little time, but it will prove the most profitable time you devote to your whole business.

* * *

Anything cruel to the bird, deceptive to the judge or unfair to a fellow exhibitor is facking.

* * *

Every legitimate business deserves the best there is in one. He should give the work his best effort and thought, or get out of the way for a man.

* * *

Oiling the harness is a good job for a rainy day; it makes the harness wear longer and it certainly looks better.

* * *

Nearly every man living is an advertiser ; he may not buy space in newspapers, but his advertisement appears somewhere ; a well kept home is one sort of advertisement, a sagging gate is anorher. How do you advertise ?

* * *

Implements and farm machinery not in use should be under the shed or in the tool house. Rust is one of the best friends of the implement maker.

* * *

If you are not getting the desired results find the cause, investigate the conditions and remedy them.

The N. B. Immigration Report.

The first annual report of the Soperintendent of Immigration of New Brunswick is printed in convenient pamphet form, and is extremely interesting reading. Mr. Wilmot makes it clear that he is working and does not regard his office as a sinecure. As he says, only a beginning was made in systematic immigration work last year, yet enough was accomplished to justify the creation of the Department. In summing up Mr. Wilmot is optimistic of the future. He says :—

The prospect for larger immigration in New Brunswick is bright. The construction of railways and the development of mineral resources of the Province will provide for the employment of many men and the expenditure of much money. Increased land values and a wider market for the agricultural population must follow. When such facts as these are placed before the home seekers we require the results will more than justify the expenditure and effort necessary to accomplish our undertaking.

After reviewing the preliminary work leading up to the creation of the Department of Immigration under the direction of the commissioner for Agriculture Mr. Wilmot proceeds:

PRELIMINARY WORK.

Before attempting to grapple with the problems incidental to a successful immigration policy, I decided to ascertain for myself what others were doing, and how they were doing it.

With that object in view I visited Halifax, Montreal, Toronto and Ottawa, and consulted with the Immigration and Colonization officials of those centres in regard to promoting immigration and handling the settlers on their arrival.

From Mr. A. S. Barnstead, of Nova Scotia, Messrs. Marquette and Caufell, of Quebec, Mr. Thos. Southworth, of Ontario, and the Dominion Superintendent of Immigration, Mr. W. D. Scott, I gathered a great deal of useful and practical information.

These gentlemen had perfected their systems in the light of observation and experience, and did not hesitate to give me the benefit.

On returning to St. John my first step was to call the attention of those interested to tne fact that the Provincial Immigration Office at 4 Church Btreet, was open for business.

Blank forms to be used by those requiring farm help were distributed among the members of the different Agricultural Sacieties and other employers of labor throughout the Province. Letters were written, and correspondence invited.

As a result upwards of 100 farms and ten water powers were listed; the reasons offered for selling the farms were old age or sickness, and no one at home to take up the farm work, difficulty in getting farm labor, etc.

Applications for farm help came in less rapidly, possibly because a class of labor which was drifting in from time to time had proved unsatisfactory.

THE REQUIREMENTS.

I found a demand for a high class of farm labor, workers who understood farming and were not without some executive ability.

There were also requests for inexperienced men and boys willing to learn farming.

A continuous call for domestic servants was always in evidence.

I found a considerable number of farms for sale, some were listed far in excess of their market value, others offered at a fair value, while not a few could be got at bargain prices.

Besides these were the vacant farms, a large proportion of which were available at low figures, especially to a purchaser who knew values and had the cash.

With these requirements before me I turned to Great Britain where every State in the Empire is actively bidding for a share of her wealth and the best of her bone and sinew.

New Brunswick's London Office was at that time not organized as an effective emigration agency. My attention was in consequence partly turned to the booking agents, the men who nave the saying of the last word to the emigrant. In this I was particularly fortunate in arousing interest and co-operation, which has been followed by an almost constant supply of desirable farm laborers, many of whom brought their families.

The story of these people since their arrival in New Brunswick, of their success and their satisfaction at having come, will serve as an inspiration to others who are looking beyond the seas for a land of opportunities.

Immigration coming under direction of Superintendent of Immigration was as follows from :

Scotland	193
England	79
Ireland	17
Poland	7
Sweden	5
Holland and Germany	4
Total	305

There were seventeen families, numbering seventy-five people, of which ten familes went to the land.

Domestics	30
Single men to the farms	210
Single men to other than farm work	90

PENSIONERS.

This particular class of immigrants require an introduction because they come to the Province under conditions heretofore impracticable.

In the month of March 1908, the British War Secretary made it possible for pensioners of any age wishing to emigrate to commute that part of their pension above one shilling per day, provided the Government of the Province receiving them would undertake to supervise their settlement and safeguard their money.

I suggested a scheme to accomplish this which was finally adopted by the War Office and the Provincial Government, and which I hope will result in the immigration to this Province of a large number of this desirable class of trained men of ability, energy and character, most of whom have already had some colonial experience.

Already the following pensioners have been placed in the Province and are at work getting some practical experience before buying a homestead A. C. Milne, J. W. Mansfield, George Pipe and Edward Eyres-

Take this little group alone, and if we capitalize the present cash value of one or two shillings per day which they are drawing, and add to that amount the cash already realized from their commuted pay, it will be found to represent the tidy sum of $12,000.

Notwithstanding the fact that these men with one exception came to the Province at the least advantageous season of the year, namely, the late fall and early winter, the results have been particularly gratifying.

There are in Great Britain many thousands of capable girls who would come to Canada if they had the means to pay their passages. At home their wages average $5.00 per month, and they are anxious to improve their position. It occurred to me that with reasonable care exercised by our correspondents abroad a good selection of domestic servants could be brought to the Province, and that there would be the minimum of risk to the employer in advancing the passage money.

Up to December 31st I placed thirty domestics with those who applied at this office.

Upwards of $800.00 was advanced by the employers to pay the passages. I have yet to hear of a dollar being lost by anyone. The girls, while not expert cooks and housekeepers, have maintained a good standard for industry, and have shown a determination to become familiar with the work requiced in a New Brunswick household.

THE PLACING OF IMMIGRANTS.

Those who arrived were sent out to the different sections of the Province where places had been provided for them. There was always a cottage or a flat somewhere in the country available for each family arriving. Consequently there was no confusion from delay.

In placing immigrants whether they be laborers or settlers, each man is sent to a certain farm or locality, because it is thought that he will do better in that particular place or give more satisfactory results to that particular employer. In other words, a haphazard distribution is to be avoided.

FRUIT EXHIBIT.

The New Brunswick display of apples made for the first time at the Horticultural Show at Westminister last December, was a revelation to many who had not associated this Province with fruit growing.

The London "Standard of Empire" makes the following interesting reference to that event :

"Among the new comers was New Brunswick, making a most creditable display of a great variety of apples, which says much for the capacities of this Province for fruit growing, in respect of which very little has been heard hitherto. The silver gilt Knightian medal was awarded for the collective exhibit and silver Banksian medal to three individual exhibitors."

The day is coming when New Brunswick will take a first place in the markets of the world as a fruit producing country. That day will be hastened if our fruit is placed on exhibition at as many agricultural and horticultural shows as practicable.

Mr. Obed Smith, who has charge of Dominion immigration in Great Britain, has invited the Province to keep fruit on exhibition at the Dominion Government Offices in London. The Canadian Pacific offered their agencies for the same purpose, which together with a good display at the Provincial Government Offices, London, should prove a most valuable advertisement for the prize winning fruit which New Brunswick produces.

SOME RESULTS.

One year has passed since this office was established, a year during which the work must of necessity be largely formulative

Yet something has been accomplished.

An industrious and intelligent class of people have come to remain. They are all at work. No complaints are coming to this office from them or their employers. They appreciate the health giving climate and the material advantages that are theirs. The hope to cultivate their own land will become a reality—no longer an idle dream; and they mark the difference.

I happen to know of twenty settlers who are coming to New Brunswick because of the success of friends who were placed last yeas. There are probably many more.

Paints on the Farm.

Never apply paint or any other coating to green or unseasoned timber.

Paint the outside of buildings in the autumn after the hot weather is passed, or in winter. Oil paint, under cold, hardens so as to be much more durable than when it dries under heat.

Experiments on the behavior of different paints for ironwork seem to show that red best resists the action of the atmosphere.

A good paint for sheet iron is made of varnish and boiled linseed oil, equal parts; add enough red lead to bring to the consistency of ordinary paint.

A good black paint for ironwork, farm implements, etc., is made by mixing two quarts of coal tar with one pint of gasoline. The gasoline thins it nicely, so that it spreads evenly. Gasoline evaporates rapidly, and if the work is not quickly finished a little more may be added to keep the proper consistency.

To protect iron from rust use red lead mixed pretty stiff with boiled oil. For small work a little Japan dryer may be added and perhaps 10 per cent. of litharge, so as to make it dry quicker and harder. If a bolt is going through wood, coat the hole with the lead and paint the bolt, and there will be no rusting. If a piece of iron is going into some place where it cannot be washed, clean it well and then paint it with two coats of red lead.

For a good fence paint take skim milk two quarts, fresh slaked lime eight ounces, Spanish white three pounds. The lime is to be slaked in water exposed to the air, and then mixed with abour one-fourth of the milk, the oil in which the pitch is dissolved to be added a little at a time, then the rest of the milk, and afterward the Spanish white. This is sufficient for about twenty-sepen yards, two coats. If any other color than white is desired use the color in place of a part of the Spanish white.

Whitewash may be put on with the spray pump provided the wash is thoroughly strained before pumping; otherwise particles are apt to clog in the pump. The work is rapidly done and the wash is forced into crevices where a brush could not reach.

For an outside whitewash take a clean, water-tight barrel or other suitable receptacle, and put into it a half bushel of lime. Siake it by pouring enough boiling hot water over to cover it five inches deep and stir briskly until well slaked. When thoroughly slaked, dissolve it in water and add two pounds of sulphate of zinc and of common salt; these will cause the wash to harden and prevent its cracking. For other colors than white; for cream color, add three poands of yellow ochre; for pear,, gray or lead color, add lampblack; for fawn color, add four pounds umber, one pound Indian red, one pound common lampblack; for common stone color, add four pounds of raw umber abd two pounds of lampblack- Before mixing the lampblack dissolve it in vinegar.

For preserving fence posts paint them with a mixture of boiled linseed oil and pulverized charcoal of the consistency of paint. Neither time nor weather will affect them. The one giving the recipe says : "I would as soon have poplar, basswood or ash as any other kind of timber for fence posts. I have taken out basswood posts after having been set seven years that were as sound when taken out as when put in the ground."—E. I. Locke.

The Use of Fertilizers.

That reliable fertiiizers will not exhaust, but on the contrary, will build up the poorest land into highest productiveness, has now been proven beyond cavil or doubt. The writer has used only chemical fertilizers for over 30 yegrs, and those who adopted his system of fertilization 20 years ago are now corrobating his experience. In apples, the crops have been most satitfactory. There have been no off years, and the fru;t has always been of first quality. While the crops have not been surprisingly large, they have been good compared with the quantity of fertilizer used. A larger quantity would probably have insured heavier crops. This now being tested The quantity used has never exceeded $8.00 or $9.00 worth per acre, or less than 8cts. for each barrel of apples packed. During the past 10 years there have been an average yield of 110 bbls. of packed fruit per acre which means 1100 bbls. from every acre under cultivation during that period. On a valuation of $1000 per acre the fruit has paid all the expenses incident to its production, and left for the owner a surplus of from 14 to 17½ per cent. Others report heavier crops than any I have grown, but large crops are often followed by a year of comparative barreness, it is the long steady pull that counts.

Below is a brief report of the only 4 acres in full bearing for 1908. The balance of 30 acres is still in various stages below full production. The crop of 1909 is equally good, but at this writing has not all been realized on.

Pruning	$ 10.00
Fertilizer for 4 acres at $9	$ 36.00
Hauling and sowing fertilizers	2.00
Discing 4 times at $2	8.00
Vetch 2 bushels at $2.10 ...	4.20
Buckwheat 2 bus. at 75c.....	1.50
Sowing cover crop	1.50
Spraying 3 times	22.40
Bbs, 451 at 25c	113.00
Picking, packing and trucking at 25c.	113.00
Sundries	4.80
Total expenses	320.00
451 bbls. apples, net proceeds	1017.74
Balance	697.74

This is about 17½ per cent for the owner on a valuation of $1000.00 per acre, and reckoned as though all the work had been done by hired help. There are many orchards doing much better than this, and solely because they get better care; but this moderate result shows most clearly the possibilities of scientific orchard culture in the Annapolis Valley.—G. C. Miller, Middleton, N. S.

Aphis of the Apple Tree.

The past two seasons have seen an unusual outbreak of plant lice on trees of all kinds. The chermes on the spruce seem to have been very successful in their growth. The broad.leaved trees of the forest hape also been widely attacked by plant lice and most noticeable of all has been the increase among those attacking the apple. Two species have more because they have to be dug by They will probably cost a little hand as there will not be more than 50 per cent. of the tre?s in the been especially common: aphis pomi and schizoneura langifera. Aphis poma is our common green plant louse on the apple trees during spring and summer. It has had many another scientific name, the most common of which is Aphis Mali. It has been steadily on the increase during the past four or five years. Indeed, I urged fruit growers in many localities then to spray for this insect where it was common, but not yet abundant in their orcharks. But they did not think it serious. By some I was taken to task for even suggesting such a thing.

Its life history is not briefly told. The first lice in spring hatch from eggs which have lived over winter. These lice are all agamic females, which in turn give birth to similar females, usually without wings at first but later with wings. This is kept up till late in summer when males and egg-laying females are produced. The eggs are laid on the young branches, and greenish at first soon turn to a glossy black.

The lice feed by inserting their beak through the epidermis of the leaf and sucking the juice.

Frost is fatal to them as in any strong alkaline spray as soap or kerosine emulsion. Poisons do not kill them when sprayed on the plants as they do not eat the leaves but only the juice. They multiply so rapidly that even when most are killed the few which escape soon supply their places with as many more. As they feed they cause the leaf to curl over so as to protect them.

However, many insect enemies find them out and destroy them.

The other common plant louse on the Apple is schizneura langitera, the woolley aphis. This is not easi'y killed by frost and the young pass the winter alive and ready to perpetuate the species in the spring. As the insect approaches maturity it secrets a white down on the back of the abdomen, which gives it its common name—"woolley" aphis. The young which live through the winter do not possess this down till spring. It does not afford protection from the cold. It would afford interesting information to know the particular purpose in nature it does subserve.

These lice live also on the roots of trees. There is a western species which live on corn and on the roots of corn, and for which the ants show considerable solicitude. They carry them from underground in spring and place them on the young corn plants, and carry them to the roots of the plant in autumn. This species is more easily contro'led than those attacking the apple.—Prof. H. W. Smith, Truro, N. S., im Maritime Students Agriculturist.

Planting the Orchard.

In preparing to set out an orchard we would select a field affording natural drainage and, if possible, natural shelter; that is, if one has a grove or hedge on the farm to take advantage of, as a shelter for the orchard, for there is not much use growing fruit and having it blown off by the heavy autumn winds. A row of cherry trees planted thickly around the outside of the orchard would make quite a good windbreak and prove a source of profit as well. We would also plant an evergreen hedge outside of all and, if fruit trees and evergreens were set out at the same time, the shelter would be sufficient by the time the trees had fruited.

A good preparation of the ground would be to plow and harrow, then sow with peas or buckwheat, and when it had grown up sufficiently, to plow it down. This would make the ground mellow and provide an abundant supply of the best kind of food for the roots.

smoothing it, lay off the orchard in

After pulverizing the soil and rows each way, at whatever distance the trees are to be planted. Set up the trees are to be planted. Set up stakes in line and plant where the lines inteesect. This will leave the trees in line every way and will facilitate working among them. When pail of water, as the clay will adplanting the trees dip the roots in a here quickly to the wet rootlets and facilitate speedy growth. For years hoed crops may be grown between the rows of trees, if plenty of manure is used; the trees can thus be cultivated with profit. Late in the fall the young trees should be wrapped about the trunk with building paper to the height of abbut eighteen inches to protect them from being girdled by mice. This is about the way we set out our trees and we have never yet had an apple tree fail to grow. If every farmer in Prince Edward Island could be induced to plant five acres of orchard the exodus would stop and we would double our population in fifteen years.—A P. E. Islander in Canadian Horticulturist.

Selection of Nursery Stock.

"Every fruit grower should be able to tell at a glance what age a tree is when it comes to him from the nursery," said Prof. J. W. Crow, when discussing the above subject at the short course in fruit growing at Guelph. "Every tree has on it marks which show plainly how old the tree is. The terminal bud of a branch is a ways protected during winter by a number of scales. In the spring the buds continue the growth of the tree and the scales drop off, but the scars remain and form a distinct ring around the limb or trunk, marking each year's growth quite plainly unless removed by cutting. Thus a tree one-year-old will show no ring of scars; a two-year-old tree will show one ring of scars at the junction of the one and two-year-old wood; a threefyear-old-tree will show, two rings; and so on,"

At the beginning of the second year the nursery-man cuts back his apple trees and trims them to the desired height to form the head. If he sells the tree at two years old well and good; if not, he may let it grow but more likely he will cus it back again to keep the head from getting too big. This means that he will remove practically all the last yeas's growth. Thus a year can be added to the age of the tree for every time the knife has been applied. The marks of the knife are always evident. A tree that has stood continuously in the nursery row for three to five years, as not unfrequently happens with certain varities or when trade is slow, does not transplant with such certainty of success as does a one or two-year-old tree.

One-year-old, well grown apple trees are preferable for planting. In the first place they must be sturdy stock in order to attain the right size in a year. Then it is much easier to head a one-year-old tree low down than it is a two or thcee-year-old. These older trees gre usually headed about three feet from the ground which is too high. A low-headed tree is preferable because the limbs tend to a more upright habit of growth, sun-scald is almost entirely confined to high, open-headed trees; it is much more economical to prune, spray and pick the fruit from such trees.

Before planting a considerable number of trees it will pay well, if convenient, to visit the nursery and choose your own stock. Choose one-year-old trees not less than 30 inches high. If you insist on having one-year-old trees you will ges them.

FOR SALE.

100,000 apple trees, 75,000 Pears Plums Cherries. Complete assortment of other stock. Guaranteed first grade and TRUE TO NAME. Agents wanted on vacant territory, selling for fall and spring 1911 delivery.

Minard's Liniment Co., Limited

FATHER MORRISCY'S REMEDIES.

Cured a Truro Lady of Both Lung and Kidney Troubles.

Truro, N.S., Jan. 14th., 1910.
Father Morriscy Med. Co., Ltd.

For some time I had been troubled with a very dry cough and pain in my lungs. I made up my mind to try your medecine, and had used one bottle of No. 10 (Lung Tonic) when the pain left me and I felt much better.

My kidneys troubled me quite a lot also, and I purchased a box of your No. 7 (rheumatism and kidney cure) and since taking the tablets I have had no pain in my side or back. I spent quite a lot of money in medicine, but none of the remedies I tried ever helped me, until a lady friend showed me your advertisement. I am now fat and healthy, and your remedies have saved me from the grave.

(Miss) MARTHA WHITE.

None of Father Morriscy's remedies have ever been heralded as "cure-alls." The wise priest-physician prescribed a special remedy for each kind of disease—a remedy skilfully devised to cure that particular trouble and that only.

No. 10 (Lung Tonic), besides curing colds, inflammation, pneumonia, bronchitis and other diseases of throat and lungs, strengthens these organs and gives them vigour to resist a return of the trouble.

No. 7 Tablets stimulate weak kidneys so that they can properly perform their function of filtering from the blood the impurities that cause rheumatism.

The action of both these remedies is hastened if Father Morriscy's Liniment is applied freely externally.

No. 7 Tablets for Kidneys and Rheumatism are put up in 50c. boxes; No. 10 (Lung Tonic) in 25c. and 50c. bottles, and Father Morriscy's Liniment in 25c. bottles. At your dealer's, or from Father Morriscy Medicine Co., Ltd., Chatham, N.B. 97

nursery row fit for your purpose. Do not buy poor one-year-olds, as it is necessary with these to cut them off nearly at the ground in order to stimulate strong growth after they are planted.

Peach trees are nearly all sold at one year old. It does not pay to buy big No. 1 stock. Medium-sized No. 2 is better, as it transplants with greater safety and makes a better tree for low heading. If possible, buy peach trees with all their branches on them. Thus you will be able to head your tree just where you like. This will probably mean giving the nurseryman instructions a year ahead but it will pay.

It is good practice to grow your own nursery stock. Grow your seedlings or procure them from a nursery. Plant them in the spring in rows and cultivate as you would potatoes. In July bud these with buds taken from the very best bearing trees of the very best varieties in your locality. A very little practice will make any intelligent man a competent hand at budding as the process is simple. If you do not care to grow your own stock, buy trees that will make good stock for grafting, such as Tolman or McMahon; after these have been set two or three years top graft with scions from the very best bearing trees of the desired variety to be found in your locality. There is as much individuality in a tree as there is in a dairy cow. Select your trees as you would select your dairy cows by breeding from the very best individuals you can find. The nurseryman cannot do this as he must select his scions wherever he can get them; but the fruit grower can easily mark the trees in his own or his neighbor's orchard that are giving extra big returns and can secure scions from these trees.—D. S.

I prefer to disturb the asparagus bed in the fall rather than in the spring, especially a belated spring when the growths peep up almost before the snow is gone. About last work in the garden in fall, when asparagus growths are yellow and the sap returned to the xcrowns, cut close over and burn. Remove a couple of inches of soil or more from the surface. This takes away sour soil and insect eggs. Apply a dressing of well-spent manure and soil mixed and over this, six inches of strawy manure or leaves with branches to keep it down. This provides the winter garment.

At the end of April, weather favorable, remove the straw and tidy the bed. Keep it within the limits by the spade on each side. Slightly fork over the surface; a spade should never be used, for the roots have ransacked the soil in all directions.

With the approach of mild weather give a dressing of salt—about one pound to each ten square feet at intervals, say May 15, May 30 and June 15.

We generally cut about May 10 and continue until June 20. Short, stubby stalks about six inches long are the best, measuring three-quarters of an inch to one inch at the base. Cut these as far below the surface as possible. Tie in a bunch and cut the ends even.

Allow a fair proportion of growths to come up to strengthen the crowns for the succeeding season.

Seed can be saved in the fall when red, sown in spring in drills two inches deep and thinned to six inches allowing them to remain two years prior to planting.

The asparagut is valuable not only as a vegetable, but also as green material for decorating flower vases, and so on. It adds a charm to cut blooms. The side growths are best. No harm is caused by the cutting.
A. V. Main, in Canadian Horticulturist.

That Red Rose Tea is of surpassing quality is accepted everywhere it is used as an undisputed fact, but it is in the Maritime Provinces especially that it has by unvarying goodness so well earned the term "is good tea." 61

ROOFING.

Everybody who lives in a house ought to know how to tell the difference between good and bad roofing. That is why we have printed two instructive books on roofing for distribution among house-owners.

These two books—**"All About Roofing,"** and **"The Ruberoid Album"**—will be sent free for your name and address.

They tell about the various kinds of roofs; why some roofs last longer than others, and need less repairs, and what good roofing ought to cost.

LIVE STOCK.

Developing Pure Bred Stock

It is an axiom among stockmen that two generations of poor feeding will ruin the best of meat-producing animals, writes Wayne Dinsmore, of Iowa State College. Lack of feed brands its imprint on the animal, even before birth and alters both form and function. Investigations by Walters go to indicate that poorly nourished animals tend to become narrower and taller than those well nourished. Such alteration in form and function is not wholly overcome by the latter liberal feeding. This is in line with the general experience that animals once stunted never reach a normal development. Men of experience in developing show animals are frank to admit that there are thousands of possible winners yet undeveloped. One breeder, who has neveloped and shown many calves from a well known sire, expressed his opinion thus: "I beliepe that I can take almost any calf from this sire and make a showyard winner of him. All they need is feed and opportunity." There are many animals possessing latent possibilities as record-makers that are never heard of because they are not fully tried. Opportunity means much to animals as well as men.

It is well known, however, that many showyard prospects fail although given all possible feed and care. The fault sometimes lies with the feeder, who has erred in feeding too much, or in giving wrong feed, but it as often lies in the animal. A weakness of constitution or of digestive system may be present, unsuspected until brought out by test. It is generally conceded that improvement in our domestic animals has come chiefly through the selection and breeding together of those animals which most nearly approach the breeder's ideal in meat or milk production, or in work. In the progeny of any sire, out of a uniform lot of females, there will be many that will never equal the sire in his points of excellence. Many others on maturity will be about equal in merit to the parent stock, and some will surpass the sire and dam in the desired features if they are permitted a full development of inherent tendencies. Approximately 50 per cent. may be expected to be equal to or better than the sire, if the dams are equal in merit. The remaining 50 per cent will fall below the level of their parents.

Inasmuch as improvement has come by selecting and breeding together those animals which most nearly conform to the breeder's ideal it is evident that the most rapid progress can come away only by rejecting all animals not up to the standard of the parents, and by using for sires only those males which markedly excel the herd sire in the desired points. A considerable number of the inferior progeny of each generation can be sorted out and discarded while still young; but those that will be nearly equal to, and superior to their parents cannot be accurately divided until they have been given a full opportunity to develop and have approached maturity. Those that have varied most in the desired direction, surpassing their parents in such desired features as greater size, earlier maturity, thicker flesh, greater milk production, or power to do work, can then be reserved and used as the foundation stock for the next generation. Definite, rapid progress will result from such a policy for each generation means an actual advance, be it small or great. The elimination of all animals that fail to reach the standard of the parents will simplify the work of the breeder, and will enable him to concentrate his efforts on the main problem.

The full development of breeding stock prior to selection is necessarily an expensive proposition, for it means a policy of very liberal feeding from birth until the animals are nearly mature. When applied to two-thirds of the animal crop it means that much capital will be tied up for a considerable length of time; and it is seldom possible to weed out more than one-third of the annual production of young stock, with an assurance of their falling below the level of the parents at maturity. With the rest it is necessary to wait and see what the outcome will be. Full development of the anumals is necessary, for without this such desired characterissics, as early maturity, great wealth of natural flesh, strong digestive powers and other similar features will not be brought out. Canada has many stock breeders, but a very limited number of great improvers. The men are few who are producing in each generation, animals that are a distinct advance on the parent stock. More creative breeders are needed, who have the ability to select firstclass foundation stock, the means to carry the progeny to a full development, and the resolution to refuse to price the animals which show a distinct advance in merit over the parent stock.

Have A Pig pasture

The cheapest gains on growing pigs can never be made by a grain ration only. The pig is naturally a forager, and by all means the most economical way to make summer gains is to have a pig pasture and allow the animals to gather a goodly portion of their own living.

For a permanent pasture, if it can be had to succeed, one of the best things would no doubt be alfalfa. Any of the clovers, also, would do very well. The high percentage of nitrogenous content in all of these especially adapts them to flesh formation. Of the grasses, brome is the best for pigs, as it remains green and tasty during a longer period of the season than any of the other grasses.

But, after all, probably the best results can be had by sowing an annual crop. For early spring grazing nothing can beat fall sown rye. A little later, wheat or oats—or possibly wheat and oats mixed—will produce splendid feeding, and will take only a small patch to keep a large herd of pigs. Then, for the latter part of the season, peas and rape are excellent. Rape will grow more feed on an acre than peas, but peas do very well in this country, and the pigs will grow faster on a pea patch than on a rape patch unless a fair amount of grain is fed with the rape. But the pea crop to be so used should be sown on a clean piece of land. Otherwise the weeds will have a good chance to multiply. Wild oats would delight in such a chance, and so would thistles and almost all other weeds.

The pig pasture is pery much better if it provides a run to a slough or stream, but so long as there is a good troughful of water in the lot all the time this will not be so important. There should also be shade, but it is an easy matter to erect a season.

temporary shelter or two by putting up a few boards in such a way that they will both furnish shade and keep off the rain.

The problem of fencing may make it compulsory to confine pigs to the same lot year after year. Otherwise, it were better to move them about putting them on to new ground each season.

Of course, while green feed helps to make cheap grain, is should not be depended upkn entirely. The best results are attained when green feed and a small amount of grain are given. in combination. It is much better still if a small quantity of skim milk is added to the feed.

The Mutton Sheep

To form a basis for estimating the good and bad qualities of sheep, it is best to consider the carcass and that from the point of view of the butcher. The different parts of the lamb show a wide variation from the butcher's standpoint.

The most valuable meat is found over the back, loin and hind-quarters. The butcher, therefore, requires a broad back, a broad full loin and a heavily fleshed leg of mutton. The shoulder is not so valuable as the cuts farther back. The neck is a cheap part and is valuable according to thickness, but since it sells for little it is not important to breed for neck development. On the other hand, a thin neck is to be avoided because such indicates weakness of constitution, and a thin neck usually goes with a slenderness of body. The neck, therefore, should be short and thick, which condition is likely to characterize the entire carcass.

The carcass is usually divided by the butcher between the second and third ribs. The first part is worth about two cents a pound less than the hind part. It, therefore, follows that from the market standpoint the development of the back, loin and hind-quarters must be kept in mind. In all the parts smoothness of conformation is important. Roughness or angulariry invariably go with bareness of back and an excess of bone in the carsass. A rough sheep is usually very open at the top of the snoulder, showing a pronounced depression between the shoulder blades. This part for six or seven inches should be flat and well covered with flesh in a fatted sheep. The ribs shou,d show good spring and be well covered with firm flesh. The backbone should not stand prominent at any point in a sheep even in only moderate flesh. A groove over the spinal column frequently seen in well fleshed sheep is not objectionable, although flatness and smoothness are rather to be preferred. While a full, fleshy loin is most desirable a high arching loin is not the formation to be looked for and perpetuated. The level, smoothness recommended for the shoulder and back over the ribs should characterize the loin. A high loin is inclined to be bare rather than fleshy, or the loin may appear high in comparison with a low, sagging back which is always to be condemned as bad formation.

The loin should have width and thickness in order to yield a good quantity of flesh. Among the common flocks of the country drooping rumps are frequently seen. This is most undesirable, whether the falling away is towards the tail, head or down the thigh. The hind-quarter should continue straight and full both on the top and side lines. From the hip to the hock a sheep in good flesh should be especially strong. Not only the "leg of mutton" be plump and full with muscle on the outside, but between the legs in the twist, the flesh should fill well down to the hock, compelling the hind legs to stand well apart. When grasping the leg of mutton on the inside a decided plumpness should be found in a mutton sheep.

The stomach and liver must be restored to a healthy condition and Chamberlain's Stomach and Liver Tablets can be depended upon to do it. Easy to take and most effective. Sold by all dealers.

successfhl, we do not wonder that there is still much to do.

The lesson learned by such experiences were necessary that we might know how to avoid errors in the future, but many have them to learn yet, so I am writing this to try to teach those that prove apt scholars in a way that will nos cost them so dearly as has the education of many of us that have for years given our time and our ability to the work.

Perhaps the chief mistake that has been made by those who would be cattle breeders or improvers was that of wishing to found a herd and make from it a profit the first and each following year, regardless of the effect on the herd itself. More of us have been cattle dealers or speculators than real breeders as the term should be applied. Many herds have been well started, perhaps with intentions good enough, to cootinue for a lifetime but the desire to get some returns seized the man and these was no gainsaying that desire until it was sasisfied. Many such herds have been weakened by the best being sold because they could be sold the easiest and for the most satisfactory prices; this policy is difficult to stop. There can be but one result, the owner of the herd handicaps himself in such a way that he can never be in the race, and his herd becomes commonplace, he becomes discouraged, and the herd is dispersed without attracting attention of breeders and with poor results to the owner.

Another experience that has been a common one in Canada, and, I presume all countries where cattle are bred, is that of buying good females, paying for them with a liberal hand, but failing to get a head for the hesd that is suitable. How often do we see this happen? Some of the best herds in the land have been literally spoiled in this way. Every man with a bit of necessary instinct to make a breeder knows that a good bull is half the herd, and it has been said more than once with a lot of truth that a bad bull is the whole herd. It is impossible to account for the failure in so many instances to provide the sire worthy dams with which he is to be mated. This mistake applies to the breeder of commercial catt,e as well as to the breeder of a pure herd. I cannot account for it, nor have I seen a man that could. The first sire used should be as good as you can get, the following sires should be better than the first, for the more difficult it is to further improve it. The best herds in the land are hard to improve, they are even hard to keep up to their present standard, because of the difficulty in getting sires that are better than the herd. The two most successful breeders in Great Britain have the most trouble in finding sires for their herds. Price is no object with them, but the form must be there, and it must have been there for many generations in every branch or the defects will show up in the offspring, and a decline instead of improvement will take place in the quality of the herd. A herd of cattle long established, bred for many generations by the same man, with the same object, must, if good judgement is used become valuable and impressive when used on other herds. If bred with poor judgment, the longer time they are thus bred the more dangerous they become, for they wi,l have as much influence for bad as in the former case for good. The first way is what makes a good pedigree worse than none.

A third and costly mistake id often made in buying the foundation females. The usual way is to buy one from each of the different herds or from some man that has collected them from different herds. Earh one has perhaps been bred by skilled men, but with different ideas and they may be of different types, though all of recognized good types, each would perhaps in such a case need a different sire to suit them. The man to succeed with such a herd would require supernatural ability, something that cannot be found and should not be expected in an ordinary mortal. In time he mey get control to a certain extent, but a better way would be to buy the females from one herd as in this way one is more likely to get animals that have been bred with a definite purpose in view.

Amatite ROOFING

NEEDS NO PAINTING.

MOST ready roofings require special painting and coating, and unless this is done regularly, you are sure to have leaks and trouble right along.

If you use Amatite, nothing of the sort is required. You will have real roof protection WITHOUT PAINTING of any kind.

Amatite is made to stay waterproof and give protection year after year, without any thought or care on your part.

FIRST—Because it is waterproofed with Coal Tar Pitch.

SECOND—Because it has a real Mineral Surface.

Amatite, owing to these features, is the most economical roofing made. Its first cost is low, and you are SAVED all future expense for repairs or paint because it will need neither.

If you haven't seen Amatite, write for a sample to-day. From it you will very quickly understand why it doesn't require painting; why it does not leak; and why it saves you money.

Address nearest office to-day.

DAIRYING.

The Paying Production of Milk.

The paying production of milk is what determines the value of the dairy cow and in order to obtain good paying results, proper care and attention must be given the cow which supplies the milk. Cleanliness is perhaps the first important factor to be considered and should be considered from all standpoints.

The stables wherein the animals are housed should be well taken care of, in fact so well taken care of that the attendent who enters at the time of milking shall find no disagreeable oder, no damp floors, no dusty feed, as all feed having a tendency to give rise to dust should be carefully sprinkled before feeding the animal; allowing the animal plenty of fresh air and sunlight.

The cleanliness should not be limited to any one source but should be an important factor from all standpoints. The milker should use utmost care, seeing that the garments as well as the hands are in a nice, clean condition and exercising judgment in the care of the animal to be milked, seeing that all milking utensils are well taken care of and the milk placed where it will have access to proper cooling conditions and in this way add to the profit of the product.

The dairy cow is either a money maker or a money loser. If she is in a good, healthy condition and her milk supply profits counteract her actual expense of keeping, she is worth the time and trouble of keeping, but, on the other hand should she consume more feed than her profits warrant, get rid of her as there are too many profit producers to be obtained to waste time experimenting, nevertheless it should be remembered that when an animal supplies products beyond the necessary amount for sustaining life, it should be fed accordingly, thus preparing the animal to create vitality in order that it may give in return profits due the owner.—Dr. David Roberts.

What a Silo Can Do.

The April issue of the Blue Valley Bulletin, which is published monthly by the Blue Valley Creamery Company of Chicago, for the benefit of its patrons, contains, along with a lot more sound advice on economical milk production, a short editorial entitled "Why you need a silo," which appeals to us as exceptionally timely. Of course silo advice is never out of season, for the benefits of a plentiful supply of ensilage extended over the whole twelve months of the year; but when the subject is put up to the non-silo user in the spring he has every opportunity, if converted, of reaping the full benefits of his conversion before another fall.

The list of arguments used in the Bulletin to win over the Blue Valley patrons are worth repeating for the use of those creamerymen who are preparing to talk silo this season. We condense them as follows :

The silo will (1) enable you to increase the amount of stock you are carrying on the farm, (2) increase the production and decrease the cost of milk and butterfat, (3) prevent shrinkage in milk flow incidents to late summer and early fall, when pastures are short and dry, in the most economical way, (4) keep up the flow in winter when butterfat is highest, (5) put in palatable form and save about forty per cent. of the feeding value of corn which is often wasted, (6) enable the farmer to get more fall plowing done, (7) keep the aggravating corn stalks out of the manure, (8) save drudgery in feeding (9) keep young ssock healthier and (10) bring the old stock through the Winter in much better condition than if wintered on dry feed.

The arguments are not copyrighted and we hope our buttermaking readers will find use for them.

Profitable Stock.

We are daily coming in contact with the products of the dairy cow in one form or another, thus it is to the interest of the owner of the dairy breed of cattle to carefully select animals when laying a foundation for his herd, which will yield him the best profit, not only selecting animals which are from a good healthy stock but animals which are good profit producers, or in other words, that yield a flow of milk, containing sufficient butter fat, to warrant the animal worth the while of keeping upon the premises. lb

While it is always essential that animals be well fed and cared for, it is oftentimes found that the animal producing the largest amount of milk is not necessarily the animal which devours the most feed and for this reason the owner should learn the temperament of each individual animal and feed it accordingly, in this way realizing profits which might otherwise be wasted..—Dr. David Roberts.

Testing Facts.

Editor The Maritime Farmer :—

Every little while facts come to light which speak in far reaching tones of the value of cow testing to the dairy farmers.

For instance a letter is just received at the Department of Argiculture, Ottawa, from Mr. George Wise, of Shellmouth, Man., which reads as follows :—"I am pleased that I was led to see what my cows are doing, though now only just entering my second year of recording each cow's doings I see there is a great difference in the returns from the creamery and of course it is there we we should find the change. Note the remarkable gain for the first four months of 1910. In 1909, from January the 1st to April the 30th, we were milking 9 cows and received $129.59 for cream sold. In 1910, during the same period, we milked only eight cows and sold cream for $229.43. Further, we made butter this year for a household of nine persons, last year we bought our butter. These are actugl facts. The only difference in feed from last year is that I have fed bran, extra all winter, bur I have sold cows that were poor ones, though one of them made a good showing the first six months of the year. The cows picked up wonderfully on a soiling crop in September, the returns show it and every animal went into winter quarters fat."

It will be noted that Mr. Wise, besides the butter used at home, made an extra hundred dollars in four months with a smallez herd. The cows are being selected, the records show which cows to keep and the fact that records are kept induces the owner to look after the herd better in every way. Cow testing pays.—C. F. W.

Advice to Young Dairymen.

If the individual dairyman wishes to improve the dairy qualities in his herd or provide for a herd which will give him a better income year after year he can go about it in two ways. He can, by the aid of his records from the cow testing association, select his best cows to head the herd, and by breeding them to good sires with dairy qualities, be reasonably certain to obtain young animals with dairy qualities. The heifers of such breeding are used to replace the poorer cows in his herd and in a few years he will have a herd which will produce much more net profit for the same labor and feed.

The second way is to buy from reputable breeders dairy cows of known qualities or young heifers of good breeding. But the price asked for such animals, while it may not be exorbitant is usually more than the average farmer is willing to pay and he will find that if he wants good dairy cows he must raise them himself. And his success will depend on his realization of the great law in breeding that "like begets like or the likeness of an ancestor." Just as surely as the good dairy cow as a rule produces offspring as good or better than herself, so surely must he expect offspring without dairy qualities from the poor dairy cow. For this reason he must choose only his best dairy animals for mothers of his future herd.

The systematic dairyman fixes minimum production as a standard of excellence in a mature cow, and while one is content if a cow produces 250 pounds of butter-fat in a year, another wants 300 pounds and selects only cows capable of such production for his mother cows. In every case the cow must be bodily sound.

But the certainty of inherited dairy qualities in the offspring does not depend upon the good qualities of the mother alone. We can only be reasonably certain when she has been bred to a sire whose ancestry shows the same good qualities which we wish to produce. When the dairyman buys the bull he has at the same time chosen the breed he wishes to work with as well as the type he wants to reproduce in his herd, and for this reason he should choose with care and deliberation. In case the herd is made up of cows of mixed breeding the bull will exert an influence on the offspring of more than 50 per cent. But as with the cow so with the bull. His value is not known until he has been tested. One must see his offspring and know their qualities before one can know his value, and many bulls have been killed before their value was known.

Members of cow testing associations have an opportunity to exchange bulls whenever it is necessary to dispose of them, and in this way the ruthless slaughter of young bulls in their prime of usefulness is prevented.

When the type has been established in a herd, it is also desirable that the sire and the dam be as nearly alike as possible, in which case the sureness of their ability to reproduce their good qualities in their offspring is increased and retrogression is guarded against. All of which goes to show that it is necessary to have a fixed plan if one shall realize the most out of his work for better animals. The improvement is greatly retarded if the cows one year are bred to a Jersy bull and the next year to a Holstein or Shorthorn or any other breed, and improvement cannot be expected at all if the cows are bred to bulls of unknown breeding or ancestry. That sort of breeding or crossing should be discontinued, and the sooner the better.

Breeding within a certain breed is always to be preferred.—Michigan Bulletin.

Securing Quality in Cream.

This is ts the time of year when the creamerymen have difficulty in securing first grade cream. The trouble is due both to the way the cream is cared for and the length of time it is held before delivering. Often when a few cows are kept there is a tendency to hold the cream for several days before delivery, especi-

Chamberlain's Stomach and Liver Tablets gently stimulate the liver and bowels to expel poisonous matter, cleanse the system, cure constipation and sick headache. Sold by all dealers.

GET OUT QUICK

That is what happens to disk filled and other common, complicated cream separators when farmers try them in comparison with simple, sanitary, easy to clean, wear a lifetime

Sharples Dairy Tubular Cream Separators

Why? Because common, complicated machines are out of date with their top heavy bowls containing 40 to 60 disks or other parts as hard to clean. And because Sharples Dairy Tubulars have suspended, self-balancing bowls containing neither disks nor other contraptions, yet produce twice the skimming force, skim twice as clean, skim faster and wash several times easier than common separators. That is why farmers all over the world call Tubulars "The World's Best".

The manufacture of Tubulars is one of Canada's leading industries. Sales easily exceed most, if not all, others combined. Probably replace more common separators than any one maker of such machines sells.

THE SHARPLES SEPARATOR CO.
TORONTO, ONT. WINNIPEG, MAN.

CreamSeparators
At Half Price.

We wish all who need a Cream Separator to read the following letters, which speak for themselves.

Lock sley, Ont., May 11, '07. Windsor Supply Co.; Gentlemen: Please find 30c for which send me India rubber rings for No. 2 Windsor Cream Separator. My Separator has been in use for four years, and still gives as good satisfaction as it did the first day we used it. Yours truly, T. Hamilton.

Thornhill, Man., July 27, 1909. The Windsor Suppy Co. Dear Sirs:—You will wonder if I ever received my Separator. I wanted to give it a good trial before I wrote you. I find it **does good work.** We like it real well I am, yours truly, Mrs. S. White.

We receive scores of letters like the above from all parts of the Dominion. Send for circular, giving full particulars by return mail. All orders filled the day received. Our prices are as follows :—

No. O. cap. 100 lbs. milk per hour.....$10.00
No. 1 cap. 210 lbs. milk per hour..... 25.00
No. 2 cap. 340 lbs. milk per hour..... 30.00

N. B.—We have in stock a few No. 1 and No. 2 Separators, which have been used only for a short time, and then exchanged for larger machines. These we are selling, while they last, at the following very low prices, for cash with order only :—No. 1, $14 00; No. 2, $16.00 These machines are all practically as good as new, and all will do perfect work, skimming as close as any separator you can buy at any price, but of course they do not look like new, nor can we sell them as new machines. We advise those who wish a first-class Cream Separator almost for a song, to order one of these. Times are hard don't be humbugged by agents into paying big prices any more for Cream Separators. Address,

Windsor Supply Co., Windsor, Ont.

ally during the busy seasons. This frequently results in cream of very poor quality.

Few people fully realize the value of cooling cream immediately after milking and holding at a low temperature until delivery. When drawn from the cow the temperature is about 98 degrees F., which is ideal for the rapid development of those bacteria that produce bad flavors in the milk and cream. This is called the "critical period" and it requires but a very short time to develop enough bad flavors to make the cream grade second or third quality.

But if the cream is cooled to 60 degrees F., or lower as soon as possible after separating and so held, few bad flavors will result. The important thing is to cool quickly and the most practical way for the average farmer to do it is by using water. The average well water is close to 50 degrees F., and if a small vat is placed between the well and the stock tank, so that the water when pumped will run through it fresh cool water may be kept around the cans. It is best to use shot-gun cans for containing the cream, as these cool the cream much quicker and can be placed in the vat more conveniently. Stirring will hasten the cooling of the cream by liberating animal heat and bringing the warm cream in contact with the sides of the can. The cream usually will not cool down to equal the temperature of the water, hence the necessity of cool fresh water around the cans.

Another very important thing to avoid is mixing warm cream with that previously separated. There is a strong tendendy to do that especially where hand separators are used and only a small amount of cream is produced each day. It warms the cool cream sufficiently so the undesirable bacteria begin to work and, after this is repeated several times, the cream is sure to be poor in quality.

Usually the price for butter-fat is fixed according to the quality of the cream. When there is a difference of from 1½ to 2 cents per pound for butter-fat from first grade cream it is greatly to the patron's advantage to take the necessary precautions to deliver a first class article. With a creamery averaging 20,000 pounds output per season, and the product selling at least 2 cents per pound below market quotations for first grade butter, they will lose $400. If the quality of the cream is not first class when delivered, it is impossible by the best methods of manufacture to make a first-class product consequently it must sell at a great disadvantage on the market, and in the end the producer is the heaviest loser. Quality should be sought for and must begin with production.

How do You Judge a Dairy Cow.

Editor The Maritime Farmer :—

A dairy cow is often judged by the scale of points of the breed to which she belongs. Another method is to rate her according to her general appearance and the external indications of milking powers; appearances are sometimes deceitful. Recently a farmer near Ormstown, Que., sold five cows at $25 each, saying they were no good as dairy cows. The purchaser found to his great satisfaction that one gave him 10,000 lbs. milk, and another 13,000 lbs. Sometimes a cow is valued because she is easy to keep, or she is a docile family pet. Coming nearer to the practical test, a farmer may judge his best cow to be the one that daily gives a couple of pails full of milk in June; though she may quickly decrease in flow, the remembrance of that big yield sticks in her owner's mind and she is undeservedly ranked too high. Or she may have earned a wide local reputation just by one isolated test for fat very likely higher than normal. On the other hand a cow that gives only a moderate yield but attends strictly to business for a reasonably long milking period will probably prove the most paluable. Again there nay be some general idea of production, but totals that are only estimated are generally in excess of the actual yield.

The positive proof of value is certainty of the cow's ability to produce milk and fat economically; the generous minded, unselfish, real dairy cow, independent of strikes and lockouts, works full time, and returns a handsome margin of profit above the computed cost of feed. The one infalliable test is a record of the production of each cow for the full period of lactation. Don't average up the herd, ascertain that each cow is a specialist.—C. F. W.

The Magnet Cream Separator

s **entirely different in its construction and is better** than any other cream separator.

It is built

MECHANICALLY CORRECT.

MECHANICALLY CORRECT means putting the power on the machine by properly **graded steps** or gears When you see a very **large wheel** turning a **very small one,** it is a **violation** of **mechanical rules** and means wear, breakage and **trouble,** but is done to **save the cost** of the extra wheels of steps. The **Canadians** who originated the **MAGNET** were **educated mechanics** and could **not** be induced to apply the make shift, worm gear drive, adopted by makers who preferred cheapness in construction to durability. Use has shown that the worm gear drive soon wears, the bowl wobbles and then considerable butter fat goes into the skim milk at each separation. The square gear does **not wear** and the **MAGNET** skims as closely after twelve years' use as the first day it skimmed.

Do not take our say so, examine for yourself.

Take the **MAGNET** stand, it is **solid, strong** and **rigid,** constructed to **hold the gears without vibration** or **possibility of accident to anyone.**

Square gear drive is used, the only drive approved of for a **fast running** machine like a cream separator.

The shape of the **MAGNET** bowl is **different** from others being **longer,** enabling the insertion of the famous **one piece skimmer,** so constructed as to take out all the butter fat but a trace, at the same time **draws** out all **dirt and foreign matter** and holds the same to be washed off. This skimmer delivers **pure cream.**

Bronze bearings are used on the **MAGNET,** because being harder than steel they do not wear out.

Glass hard steel balls, extra large size, are used, will not wear or break.

The brake (**MAGNET PATENT**) circles the bowl, stops the machine in eight seconds, does not injure it.

The bowl is supported at both ends and cannot wobble or get out of balance (**MAGNET PATENT.**) All other separator bowls are run on one end, the vibration of which leaves butter fat in the skim milk

Every point in the **MAGNET** is a strong point, no weak spots.

A cent postal card will give you a full demonstration of the **MAGNET** in your own dairy. No obligation to buy.

Variations in Cream Tests.

Circular 37 of the Missouri Experiment Station gives a short review of the more common causes of variation in the tests of rream, which will be found useful by those buttermakers who have more or less difficulty with cream patrons wherever the tests of their cream show sudden variation.

"It is impossible to run a separator under farm comditions without having variations in the test of the cream occur," says Prof. Eckles in the circular, "and in fact if the cream buyer should always give the same cream test, it would be more suspicious of dishonesty than when it varies slightly. Our experiments indicate the following to be the common causes of these variations , (1) Variations in the speed of the separator. (2) Variations in temperature of milk separated. (3) Rate the milk flows into the machine. (4) Amount of water ot skim milk used in flushing out the bowl. (5) Change in the richness of the milk separated. (6) Adjustment of the cream screw."

$11,000 in Valuable Prizes

Readers of the Maritime Farr

An Opportunity for Subscribers to The Maritime Farmer.

We have made clubbing arrangements with The Halifax Herald and The Evening Mail, whereby our subscribers can enter this contest and participate in the distribution of the handsomest array of prizes ever given by a newspaper or magazine in the Maritime Provinces. This is an excellent opportunity open to every one living in the territory in which The Herald, The Mail or The Maritime Farmer circulates. Read carefully all about this exceptional offer, and send your name to the Contest Manager at once and get full particulars.

Act at Once.

How To Enter The Contest

Send in your nomination. You will find a nomination blank printed on this page. The nomination blank is good for 1,000 votes, which gives you a fine start.

Then enlist the aid of your friends and neighbors. Use your telephone. Let everyone know that you are a candidate before they promise their help to a more enterprising candidate.

The first thing to do is to enter your name as a candidate, then either call, write or 'phone the Contest Manager, The Herald or The Maritime Farmer, Herald Building, Halifax, for a receipt book with which to secure subscriptions. Then let all your friends know you are in the contest and request them to save their votes for you.

Candidates may nominate themselves or may be nominated by their friends.

All special vote ballots issued on subscriptions are good until the end of the contest, and they may be voted at the discretion of the candidate or subscriber.

Votes are not transferable.

Votes will be allowed on subscriptions secured anywhere in Canada or the United States. But subscriptions must be paid in advance to secure votes.

The votes will be counted and canvassed by a committee of prominent citizens.

In case of a tie the prize will be divided between the contestants tieing.

Any questions which may arise will be settled by the Contest Manager of The Herald and The Maritime Farmer, Herald Building, Halifax, N. S., and decisions will be absolute and final.

Nominations must have address of the candidate.

Nominate a Candidate.

Nomination Blank—Good for 1,000 Votes.

How Prizes Will Be Given

GRAND CAPITAL PRIZE

$2,400 RUSSELL TOURING CAR—For the candidate who secures the rgest number of votes in the entire contest.

Prizes for the Three Districts

$1,250 FORD TOURING CAR—For the candidate in each of the three stricts who secures the largest number of votes in their respective district ter the grand capital prize has been awarded.

MOTOR BOAT—For the candidate in each of the three districts who ecures the second largest number of votes in their respective district. The ighest among these three will be given choice of the boats.

UPRIGHT PIANO—For the candidate in each of the three districts who ecures the third largest number of votes in their respective district.

SUIT OF FURNIUURE—For the candidate in each of the three districts ho secures the fourth largest number of votes in their respective district.

DIAMOND RING—For the candidate in each of the three districts who ecures the fifth largest number of votes in their respective district.

BICYCLE—For the candidate in each of the three districts who secures he sixth largest number of votes in their respective district.

CREAM SEPARATOR—For the candidate in each of the three districts ho secures the seventh largest number of votes in their respective district.

GRAMAPHONE—For the candidate in each of the three districts who ecures the eighth largest number of votes in their respective district.

CANOE—For the candidate in each of the three districts who secures the inth largest number of votes in their respective district.

RANGE—For the candidate in each of the three districts who secures he tenth largest number of votes in their respective district.

CAMERA—For the candidate in each of the three districts who secures he eleventh largest number of votes in their respective district.

KITCHEN CABINET—For the candidate in each of the three districts ho secures the twelfth largest number of votes in their respective district.

DIVISION OF TERRITORY.

Dissrict No. 1 :—Includes the City of Halifax and all territory west and south of the Intercolonial Railway.

District No. 2 :—Includes Dartmouth and all territory east and north of Intercolonial Railway to the Strait of Canso, New Brunswick and Prince Edward Island.

District No. 3 :—Includes the islands of Cape Breton and Newfoundland.

Make Them Sound

A lame horse is a dead loss. Spavin, Curb, Splint, Ringbone, Swollen Joints and Bony Growths won't cure themselves. Yet you can cure these troubles and make your lame horse sound with

Kendall's Spavin Cure

just as thousands have done, and are doing today.

In the 40 years that this world's famous remedy has been on the market, Kendall's Spavin Cure has saved millions of dollars to horse owners.

Mounds, P.O., Olds, Alta.

"I have used Kendall's Spavin Cure for a number of years with great success, and I think it can't be beaten as an all-around stable liniment for Kicks, Strains, Swelling of all kinds, Ringbone and Spavin".

ARTHUR FLETCHER.

No telling when you will need it. Get a bottle now—$1—6 for $5.

Dr. B. J. KENDALL CO., Enosburg Falls, Vt.

THE HORSE.

Physicing Horses,

Mr. Patley Bridge, in the course of an article in Farm and Home, comments on the foregoing subject as follows :—

Purging like bleeding, has gone a good deal out of fashion, and in these days the chemist does not sell one physic ball where forty years ago he dold a score. Perhaps in the swing of the pendulum we neglect the aloetic ball as much as our grandfathers abused it. In an old book on farriery in our possession their occurs this passage :—Next to bleeding, purging is to be considered one of the most powerful modes of depletion, and therefore, it is obvious that purging is a useful remedy in all inflammatory disorders." The old-time horse doctor and cowleech was all for "depletion," and in bygone days a dose of physic used to follow a copious bleeding as a preliminary step in the treatment of almost all deseases, especially in febrile complaints, and it killed hundreds of horses that would have recovered kad they been left to nature and the nurse. Influenza, or "pink-eye," pneumonia, strangles, and kindred disorders, in which the febrile stage is quickly followed by extreme debility, were often fatal as compared with the results now obtained under a more enlightened system of treatment in which depletion plays no part, but the strength is conserved against the day of certainly ensuing debility. As a preliminary to conditioning hunters, and with horses, old and young, just taken up from pasture, a dose of physic was always given to "get the grass out of 'em," and usually the dose was a large one, and repeated once and sometimes twice at short intervals. Now rarely more than one mild dose is given, and frequently none at all—a course of bran mashes and a gradual introduction of the grain taking the place of the drastic purge Our forefathers dealt in hugh doses, and ten and twelve drachms of aloes used frequently to be administered to a horse. Now the five-drachm physic ball is the standard size kept in stock, and six drachms of aloes is considered amply sufficient for even a big horse, if it has been properly prepared. Dealing with physic in his "Notes for Hunting Men," the late Captain Courtland Gordon Mackenzie says :— "I am sure the less drugs either we or our horses take the better. Their use was at one time, like bleeding and other relics of barbarism, much too frequent; and even now most grooms have a sneaking liking for them. I always discourage them in my own stable, and never permit their being given without my knowledge. A mild dose of aloes is necessary when a horse meets with some injury which resaires that his system shodld be suddenly cooled, and I think it is desirable when an animal is quickly changed from a very high to a very low diet, and vice versa, but the constant or periodical giving of balls is, I am sure, an abomination, and will ruin any horse's condition." A common plea for the use of physic or the necessity for purgative medicine in the spring of the year is that it greatly contributes to make horses shed their coats easily, and "prevent many humors to which they are subject at this period," and although we may laugh at the "humors" and regard humoral pathology as somewhat obsolete, there is, perhaps some good in a moderate dose of physic where horses have been kept entirely on dry food and green food is not obtainable. But there is nothing tends to secure a regular action of the bowels better than attentfon to the quantity and quality of the food, and it too frequently happens that from inattention to this serious diseases occur.

PROPER FEEDING.

Horses are most healthy when their food is properly regulated in quantity and given in sufficient variety. If the stomach and bowels are at one time overloaded and at another suffered to remain empty, it is obvious that irregular action is likely to be induced, while it is equally evident that feeding for long periods on dry and highly astringent material, especially when the natural food of the animal is of an exactly opposite character, is likely to cause derangement. If during the winter more roots, especially carrots, were employed, there would be less need for physics in the spring, and if green forage was used in moderation there would be little need for physics at all. All roots or all grass is not compatible with working condition, and it is idle to expect efficient labor on either, but there are few cases where carrots or swedes cannot be obtained in moderation and due advantage taken of their succulent, laxative, and alterative properties, just as there are few instances where small quantities of green foods, as they come along in succession, are not obtainable for use as spring medicine. Where physic is really necessary, or thought to be desirable, there is certainly no need for the large and repeated doses of aloes that used to be given. We very well remember the time when a "course of physic" consisted of three doses at intervals of a week of progressive quantities of aloes, ranging from seven to ten drachms. Captain Mackenzie mentions two cases in which physic may be desirable, the first being when a horse meets with some injury. After an accident, and in cases of acute lameness, a dose of physic is often most helpful, and we hape known it to have a magical effect in a case of lameness, and particulacly of foot lameness. The other is when there is to be a drastic change in the diet, and there is certainly an advantage in a dose of physic to get the grass out of an animal before putting it on a dry diet, and especially if a full allowance of grain is to be given at once, but even these caset of bringing horses off grass can be met by gradually introducing the grain and giving bran mashes during the transition period. In the cases of horses especially, aloes should never be repeated until from flapse of time it is certain that the first dose is to remain inoperative. We have known a case where a horse not previously "prepared" for physic, and allowed to stand in the stable, held a physic ball for a week, and at the end of that time, when it was contemplated repeating the dose, commenced to purge violently. Experience, too, goes to show that two comparatively small doses of aloes given at short intervals are much more likely to cause super purgation in the horse than the same quantity given

(Continued on page 637.)

Proper Lubrication

On your plows, harrows and drills use

Granite Harvester Oil

Insures better work from the new machine and lengthens the life of the old. Wherever bearings are loose or boxes worn it takes up the play and acts like a cushion. Changes of weather do not affect it.

Gasolene and Kerosene Engines

Standard Gas Engine Oil

is the only oil you need. It provides perfect lubrication under high temperatures without appreciable carbon deposits on rings or cylinders, and is equally good for the external bearings.

Steam Traction Engines and Steam Plants

Capitol Cylinder Oil

delivers more power, and makes the engine run better and longer with less wear and tear, because its friction-reducing properties are exactly fitted to the requirements of steam traction engines and steam plants.

Traction Engines, Wagons. Etc.

Mica Axle Grease

makes the wheel as nearly frictionless as possible and reduces the wear on axle and box. It ends axle troubles, saves energy in the horse, and when used on axles of traction engines economizes fuel and power.

Every dealer everywhere. If not at yours, write for descriptive circulars to

POULTRY.

Poultry Secrets.

Numerous are the advertisements offering to exchange some valuable poultry secret for a certain amount of the coin of the realm. Judging from the number of the advertisements and the space they occupy, there must be a good many buyers. The business evidently pays.

In what I am about to say I shall refer to no particular secret, at least so as to identify, nor shall I attempt to say that the so-called secrets are not worth all or more than they cost, but this I will, and do say, that so far as I have investigated I have found them not to be secrets at all, but well known principles in use by some of the best breeders in the land. I have in mind at this moment a sttikingly advertised secret—so strikingly advertised that I would not be surprised to learn of an immense sale of it, but which,—or the principles upon which it is founded, —was communicated to me twenty years or more ago by a breeder who had it from one much older in the industry than he. And let me say right here that I consider it a good thing, worth, to one who does not know it, all and more than it costs.

What I object to in many of these so-called secrets is this, that the seller of them is not the discoverer; that he is attempting to make money out of what cost him nothing in time, effort or expense; that he is making merchandise if what, by good right, should belong to all. When a man by his own efforts, through the expenditure of time, labor, brains and money, has discovered something of benefit to poultrymen, he is entitled to sell his discovery and reimburse himself for its cost. He has as much right to do this as any inventor who applies to the patent office to get protection for his invention. The two things are exactly parallel. And if profit will encourage the inventor to go on with his inventing, profit ought to be an inducement, a legitimate inducement to the poultry breeder to pursue his investigations and discover new and better ways and means for caring for poultry. But just as an inventor is not entitled to a patent for ideas which have been embodied in devices in public use before his alleged invention, so poultry secrets, so-called, which have been known to many for years, are not legitimate objects for sale. This modification, however, ought to be made to the last sentence. If the socalled secrets are sold for a sum sufficient to reimburse the seller for printing and distributing them, the fact of their sale at such a price is not objectionable; the only objection is in clothing them with an air of mystery by falsely calling them secrets, when they are not secrets but simply valuable information. The issuing of poultry information at a reasonable price is legitimate publishing business, as legitimate as the publication of medical, theological, legal or other books of specific information. We ought not to lose sight of this side of the question.

But one is excusable for hating and detesting announcements which are both true and still wholly misleading. If I should advertise that I could furnish an insect powder at five cents a pound, and I furnish ordinary road dust, dry and fine, with a few drops of carbolic acid added to give it an odor, the buyer would have a right to complain, And yet fine road dust is a good insect powder, choking up the spinacles of hen lice and thus killing them, when properly applied.

To summarize, let us advertise and sell secrets if we have them; let us advertise and sell information, if we desire to do so; but let us call a spade a spade,' and not mislead by our advertising any of our brethren. Let our advertisements speak the truth, so far as we know the truth, so that we shall not intentionally disappoint any who have trusted us. —H. S. Babcock.

Like Begets Like.

'Like begets like' is a law of nature that is applicable to the breeding of poultry as well as anything else. If you breed from fowls that are strong and vigorous you will get chicks that will have vigor and vitcent. of loss. If you breed stock that ality to carry them to maturity with very little trouble and a small per shows any defects or that lack vitality and vigor, you must at least expect part of your chicks to have the same defects. Remember, 'like begets like.' So start the poultry business with only the best. Better start with a trio of hardy, vigorous fowls that are up to the standard than to have 50 fowls that are not bred or that lack vigor and vitality. The success of the poultry business depends on pleasing your customers. This you cannot do unless you can furnish stock and eggs of high quality. The demand for high-class line and pedigree-bred poultry of all the leading varieties is now and has always been far beyond the supply, thus proving the necessity of breeding the best. It is not necessary to pay unreasonable prices for your stock and eggs, as there are plenty of reliable breeders that ask only an honest price. It is not advisible to buy stock or eggs from too many breeders, as one may breed for feathers and show room alone while another may be breeding for something else. Utility must not be overlooked, for some breeders do overlook this in producing show birds. Many ask what breed is best to begin with. My advice is to get breed you can handle best as a side line, with your surroundings. Get the experience, and then you may follow it alone as a business. I have found the Light Brahmas and Rose Comb Rhode Island Reds more profitable than any other breeds. The Light Brahma is without exception a favorite with poultrymen, even with those who do not breed them. They are often referred to as 'the aristocrats of the poultry yard.' In size they are the largest of domestic fowls, and with their proud, stately carriage, they are very attractive. They are great favorites as 'soft roasters' and the mature fowls are very large, weighing from 8 to 14 pounds. They are excellent layers and stand confinement better than any other breed. In the show room they attract the attention of all who see them.

The Rhode Island Reds are a general purpose breed that are gaining favor very fast, both on the farms and in the show room. They are excellent layers, large in size, best of broilers at an early age and pullets mature and begin laying very early. They are very hardy, being able to stand the heat and extreme cold of any climate. I am breeding some pens of both breeds. I have birds in my pens that score from 90 to 95 points. I think line breeding the best, as you can keep your stock bred up, to the Standard of the show room, and at the same time keep the good shape, color and laying qualities in your flocks; but I do not advise breeding too closely. Better buy cocks for the first three or four years; then use trap nests for your line breeding.—M. R. Yelton.

FREE SAMPLE CULVERT To FARMERS

Say you are interested, and we will gladly send you Free and postpaid a sample of the only Practical culvert and a handsomely illustrated book telling all about it. For drainage, road-repair, and a score of farm-uses there is no culvert so economical as this. Made of heavy Billet Iron; curved cold into half-sections. Then deeply corrugated---makes it five times stronger than smooth-surfaced pipe. Heavily galvanized with lead and zinc to make it proof against rust, dampness, decay, corrosion. Will outlast any other material.

LEARN ALL ABOUT THE MOST PRACTICAL and DURABLE CULVERT

PEDLAR NESTABLE GALVANIZED CULVERT

These pictures show how easily and quickly you can lay Pedlar Culvert. Comes nested, half-section within half-section---saving freight and cartage. Triple-thick Flat flange locking ribs on each side are clamped together by a simple tool---no bolts nor rivets needed. Joints are broken---only culvert you can do that with. Ends interlap. Will stand tremendous strains. Won't leak, nor buckle, nor crack from frost. Cheaper than wooden culverts

An Investment—Not An Expense

Investigate first. Send for the free sample and book. Then recommend this culvert to your township officials---push the Good Roads Movement---this culvert keeps roads in better shape. Use it, too, for any drainage about your farm---there's a size for every purpose. Railways use and approve it---and you know what careful buyers railways are! Investigate.

Rust-Proof
Won't Decay
Easily Laid

Jacassa's Journal.

(Continued from last Issue.)

Later—Afternoon.

Mr. Meredith came in this morning, tired and heated from his labors in the barn. I d d not know he was lying on the lounge, in the cool sitting-room, as I went down for a book I had left there, for the shutters were partially drawn. But he spoke, rising.

"What volume have you there, Miss 'Cassy?" He has called me that of late.

"Mrs. Browning's Poems."

He came forward. "Won't you sit down here by the window—I will open the shutter—and read me something, while I play 'shiftless,' as Aunt Ophelia hath it, in this comfortable rocker? or are you busy—engaged in writing? I saw you up at your window, as I came in. You must be an indefatigable correspondent."

"O no, not particularly so!" I answered, smiling, for I have been writing a long periodical article. "What particular poem shall I read you, Mr. Meredith? Have you any preference for Mrs. Browning's?"

"None. I do not know much of these latterday poets, though I may shock your taste by confessing it," he answered. "I had a Byronic age once, but latterly I have eschewed everything of his but 'Childe Harold' I read that sometimes, when I am misanthropic. Bryant I place at the head of American poets; Longfellow, Field, Lowell, I read sometimes, in hours of leisure; but these lady poets, I must confess an ignorance of them, even if it involves an acknowledgment of being behind the age. You read a great deal, Miss 'Cassy?'

"Considerable! But, indeed, you should have read Mrs. Browning, Mr. Meredith! You have lost much," I said.

"Possibly. But I am one of those who believe, with a sort of conservatism, that the whole of written poetry may be found on the pages of Homer, Milton, Shakespeare, and the Book of Isaiah. Others may write much and well, but they will only give variations on the original theme." He said this in a sort of quiet assured way; but it set me to thinking.

"Then you deny the inspiration of our modern poets?" I said at length "Because a Jenny Lind has sung, you deny the gifts of voice in a Tontag; or, to go back to a more dissant age, because Socrates was a philosopher, you deny a Sir Isaac Newton! What a poverty-striken world you would make of it, Mr. Meredith! but you shall no(condemn unheard. But tell me, after hearing if language ever held truer spirit of poerry than this!" And I read that heart-touching wail over England's human slaves—"The Cry of the Children."

He listened in a kind of rapt surprise. I could see the red, indignant blood come and go on his cheeks. "Shameful!" he said, when I had ceased, "shameful, that such things be in any land, much less in the enlightened country of our ancestors! I am glad I did not visit these factories when in England, where they grind out the souls of the poor, and where the children 'die before their time!' We all know that these things exist; but it stirs up the blohd to hear it set forth like that. A perfect word-picture, and a stirring one at that!"

"Then you acknowledge that a little of the soirit of poetry might have been rescued from Homer, Milton, and so forth, to be bestowed on Mrs. Browning?" I queried, mischievously.

"Oh, pshaw!" And he laughed and colored a little. "You women have a way of taking one up so! But that's a regular society poem—it shows up social evils. If a woman wrote it, she's got a masculine mind. I'll bet considerable, your Mrs. Browning is strong-minded, and that volume does not contain one real, tender, domestic heart-poem!"

I smiled, and turned to that exquisite lyric which always moves me stranglely—"Bertha in the Lane." I read it to its close.

"I submit; and, like Oliver Twist, I shall ask for 'more,'" he said, when I had finished. "Read me this." Turning over the leaves of the book, he had taken "Loved Once!"

My voice had trembled as I closed, and I hoped he would not ask me to read more; but I read the poem selected; then rose.

"Stay, please!" he said. "Don't hurry off above stairs! I want to talk a little. That 'Bertha in the Lane' was a sweet poem, a beautiful revelation of an unselfish soul. Do you believe there are such in the world now? Souls, I mean, who would be thus willing to resign their only beloved to another, like Berthe? Under the same circumstances, I mean?"

"I believe he or she who would struggle to win a love that belongs to another, or to retain a waning would steal his neighbors' goods or bind a captive against his will! And, love, is as guilty of sin as he who if they do, they must scorn themselves, and feel humiliated ever after!" I said this proudly, for his eyes were on my face.

"And so you fully credit, and, if called upon, I would, endure this 'love's divine self-abnegation' whereof Mrs- Browning wrires? And what is that you just read?

'Those never loved
Who dream that they loved once!'

Did you ever love, Cassy?" And again I felt his eyes upon my face.

"Never!"

I think my tone has something so assured, so cnncentrated, and withal so entire in it, that it disappointed him. He looked keenly at me. I was thinking how self-deceived I had been six years earlier in my life; and he was thinking of—I don't know what.

"And yet you have suffered."

"How do you know that? At least, what cause have you for thinking that?" I answered, half in surprise, yet retaining my self-possession.

"Oh, we legal gentlemen are schooled in heart-craft," he answered smilingly. "We have a faculty of reading hearts in faces."

"Then mine must sadly belie me," I answered; "or your legal eyes are for once glamoured! And, if I have suffered, be sure no heart malady laid the foundation of the disease."

"And you deny that you ever loved?" he asked, still regarding me fixedly.

"Most assuredly!" was my reply.

Stooping, just then, to restore me the volume, which had slid to the carpet, a miniature fell from his vest pocket. He recdvered it and passed it to me with the remark, "It is Kate Harlow. She gave it to me the day she left for Nahant, bidding me not forget her. Do you think her handsome?"

"Such a face would be called so—I believe the original is, Mr. Meredith. You could scarcely need the 'counterfeit presentment' to conjure a remembrance of her charms."

The words were assured and cool, as I handed the picture back. I think my manner was so, for the gaze which met his was firm and level. I felt that I could defy him then to read my heart on my face. I rose to leave the parlor. As he was restoring the miniature to his pucket, I saw him covertly bite his lip.

"Must you go? Promise me, first to ride down to the beach with me, after tea. The evening will be a magnificent one, for the moon is at her full."

"Thank you, but I hardly see how I can tonight. I told your Aunt Sarah I would walk over to the village with her," I replied.

"Oh, Aunt Sarah will let you off, I am sure. I will take her over myself in the phaeton. It is three miles to the village."

"But I had rather you would not ask her. Three miles will not weary me or her either. Your aunt is a great walker," I persisted.

"As you will," he replied, with a little pique in his manner. "I will not insist upon it, since you seem disposed to deny me. But I shall go back to the city soon, and I had hoped we would not grow to be enemies at parting. You remember our compact, the first day we met? and we have been friends so long."

It was foolish, this feeling which prompted my denial. Would he not be likely to suspect my true feelings? I was foolish, indeed; I might let him, at least, bear away kindly memories of me. But, after what I had said, I could not yield with a good grace.

"If I had not promised your aunt, I said, as a sort of compromise.

"Will you ride with me tomorrow night, Miss 'Cassy?"

"Thank you, I will, Mr. Meredith." I said it cheerfully.

"Thanks! We will look upon the sea once again in company. I think I shall leave Ryefield day after to-morrow, though I have not mentioned it before. Mr. Harlow writes every day for my return.

"Ane Kate, too, I suppose," I said, mentally in bitterness, As I gained my chamber." And then he will go back and forget me and all these beautiful weeks we have passed together. I shall meet them some time in the street, she leaning on his arm—he, her lover or husband."

I wish this last ride were over! I wish it were all over and he were gone!

August 22d.

How can I write of this new, strange joy flooding all my heart? How can I think calmly in this new sweet life upon which I have entered? I suppose I shall grow quieter by and by; I shall get used to happiness. It is so long since I had any one to care for me—so long since any one entered within the hedge-rows of my heart to plant sweet love-roses! and now that it should be he, of all the world! I would not have believed it yesterday, if one had come to me and told me I should pass from the bleak land of still life to this living, breathing reality. Yesterday, an isolation from the great heart of love; today, bound with strong cords I would not break. And to think he has chosen me—he, so good, so strong, so noble!

But I will write it all out calmly here. Mayhap, I shall thus still this wild surging sea of happiness which breaks over the hitherto sandy wastes of my being. It seems like the tales I have woven from my own brain—like telling what has befallen a third party—as I write it here.

Last night, when the sun was dropping, like a great globe of fire, into his crimson-draped bed among the western hills, Mr. Meredith brought round his horse, and we rode slowly down to the seashore. It is but four miles distant—the salt sea air floats up here often at twilight—and we drove leisurely. The sun was down when we reached the sands, but the deep summer twilight lingered over the land and waters. I had not talked much as we rode along; indeed, Mr. Meredith did not seem to expect it, for he filled all the time in his own way, speaking of many things—of foreign lands where he has travelled for he was abroad a year with Mr. Harlow's family, he tells me—and it was very grateful to me that he did not seem to require any effort on my part, only to sit beside him and listen. So he talked till we came quite down to the shore; then there was a silence and, letting the reins fall loosely, we rode very slowly along the sands. And, for myself, to sit there in the silence—to withdraw my thoughts from the contrast of my own bare, toiling life with the one enriched by travel he had just described—to banish the idea which had arisen before me, "If my father had lived, I, too, should have visited the Old World"—to still my heart, and sit there in the dusky twilight, heeding, hearing nothing save the voice of the etneral waters—this was for what I strugled. And the waters stilled me—the murmuring voice of the sea soothed me; soft splash of the waves on the beach seemed to wash away all thoughts of unrest from my heart, bringing me quietude, peace.

"You love the sea?" said Mr. Meredith. It seems to have a particular hold on your affections."

I had not been conscious that he was regarding me; but the twilight was not dark enough to hide the in-

Blending coffee

ful memories. Will you tell me something of yourself—your past? Be assured I do not ask from idle curiosity, but as a sincere friend."

In another mood, I might have rendered an evasive answer, or waived the subject with a light jesting remark; but his manner and words were so respectful, and, withal, so sincere, that I felt I could trust him. Keep careful watch and ward over our feelings as we may, there are seasons when the ebb-tides will flow, when the heart longs for human sympathy, and we must speak outright; so, sitting there in the twilight, I told him all. I kept back nothing, not even my passage d'amour with Montague Livingstone Wentworth, his desertion in the dark days of adversity, my loneliness in the days following my bereavement, and, lastly, my brain-and-pen labors these last solitary six years of my life. He only laughed a low, quiet laugh when I recounted the story of my grande passion, as I called it; but he heard me through silently, when I was telling of my life there in the city, then, when I had finished, said—and I knew, by his tone, that there was a sparkle of mischief in his eyes: "And to think my good Aunt Sarah has been harboring a blue, a 'strongminded' woman, all these months!" And he went off into an immoderate burst of laughter.

"The discovery seems to amuse you vastly Mr. Meredith," I said half tartly.

"It does; and not only ought it to amuse, but amaze me, Miss Bowen that I have actually lived a whole month in the same house with the lady in question, on terms of peace and quietness!" Then, relapsing into a graver mood, he continued, in a friendly tone: "But you lead an isolated life in the midst of your labors. It cannot wholly suit you, this life, Miss 'Cassy, for you were made for better things than this ceaselessly toil at the treadmill of brain labor. You possess all the gentler feminine domestic qualities, and, by and by, I suppose, will make some man happy in the different sphere of home?" He said this inquiringly.

"However fashionable it may be for young ladies to wish to declare themselves 'engaged,' " I replied, "I must prove the exception. I shall probably never marry !"

I took a sort of pleasure in saying this—letting him see how little I cared for the attentions which city belles, like Kate Harlow, covet.

"How would you like to travel—to visit the Old World—Italy?" he asked, changing the subject suddenly. "You should travel in order to write. Look here, my little friend, I have a confession!" And he laughed. "Do you suppose I didn't know you when we met? That I haven't known your propria personea all these weeks I have been here at Ryefield? The graver erudition of Coke and Blackstone, it is true, leaves me but little leisure for the light literature of the day; but I have often seen and read your articles in the ladies' magazines—Kate Harlow takes them all—and I have heard her lavish warmest eulogies on them. So my confession is this: I recognized your name when Aunt Sarah presented you, and I was confident of you during that first conversation. Haven't I kept the secret well? Give me credit for undue discreetness, Miss 'Cassy! But I was speaking of travel for material, since you vow yourself wedded to this literary life!" I was confident he smiled as he uttered these last words.

"There is an old saying, 'See Naples and die!' " I replied; "but I should be well to see Italy and live, even if I never put pen to paper again. But it is a fairy-land I never expect to reach !" And I sighed.

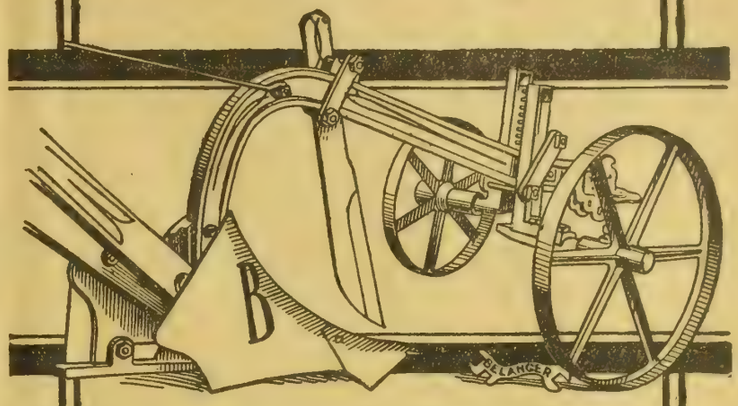
(Continued in Next Issue.)

tense gaze I raised my eyes to encounter.

"It is my father's grave! Do you wonder, now, that the sea is dear to me, Mr. Meredith?"

This was the first time I had ever spoken to him of anything connected with my past life; but the time, the place, the influences were peculiarly softening. I burst into tears. He suffered me to weep myself calm, then said, kindly: "Forgive me, Miss 'Cassy; I did not intend to call up pain-

YOU DON'T NEED A SULKY PLOW—GET THIS TRUCK.



THIS truck under the beam makes an ordinary plow as solid as a sulky—takes the strain off the plowman's arms—makes it almost unnecessary to hold the handles—keeps the plow working at an even depth—makes the draught easier and more regular on the horses—makes it possible for a boy to plow as well as a man could. Anyone can put this truck on ANY plow in 5 minutes—you don't need to have one of our celebrated "B" plows to work it. The large 18-inch wheel runs in the furrow, regulating the furrow thickness and width; the small 12-inch wheel supports the plow when the plowing is too deep and the plow has a tendency to overthrow.

Remember, $5.00 will put this truck on YOUR plow—isn't that cheaper than a sulky? What's more, that price includes free delivery anywhere in Ontario, Quebec or the Maritime Provinces. Write to us for Catalogue No. 100 5

Requisites for Matrimony.

Mr. Editor.—It has been my conclusion, lrom a somewhat random observation of my married friends, that the paramount consideration should be congeniality of temperament that two people who have not congenial tastes should beware of experimenting with matrimony. The in. ability to enter into each other's interests gradually and surely raises a wall between man and wife. It often strains love almost to the breaking point. I, therefore, place love and congenial tastes above any consideration of money. Ib

Albeit, I am far from depreciating money and its purchasing power, being myself a lover of luxury and beauty of sursoundings. I think, however, my view is broad enough to see the true ratio of a man and his worldly possessions.

I opine that the vital considerations of a man and woman before marrying are not the man's income or the woman's training or lack of training to become a wife, but rather an absorbing love, mutual interests, a happy outlook on life and an inherent desire for an ideal home.—A Spinster of Thirty.

Home Nursing.

Every woman who is the mistress of a house especially the mother of children, should know something about the art of nursing. There is something in the tender, tactful touch of woman that fits her fot this particular work. Ever since the pioneer work of Florence Nightingale in the Crimean War, woman has been inspired to care for the sick and dying, to minister to the wants of suffering humanity, until today 90 per cent. of the nursing staff off the world are females. Her sympathetic nature, soothing voice and unscrupulous cleanliness make her mans superior in the capacity of nurse.

In country districts and outlying places, it is not always convenient to call a Dr., and many an illness may be avoided by the wise administration of a sensible woman. When ordinary ailments are taken in time there is little need of a Doctor. Too often we fill ourselves up with dangerous drugs that are more dangerous to the system than the disease, especially are drugs most dangerous in growing children, where nature is constantly devcloping, unfolding and expanding. Mothers who make the welfare of her child the prime object of life, will find that cleanliness, fresh air, sunshine and, nourishing food are the only necessaries to promote healthy and happiness. Let the sickly live more out of doors. Their contact with nature makes the blood mount the temples, respiration is regular, and temperature normal. The object of hygiene is the preservation of health, and no where is it more neglected than in our common schoo,s. Ill ventilated school-rooms, improper seats, and long hours are, in my opinion (and I have been both teacher, nurse and mother) responsible for many ills of childhood. Think then how cruel it is, when they are already pale and delicate, to fill their systems with the very thing they do not need—drugs.

If I had a delicate child, I should give it a morning bath, nourishing breakfast, comfortable clothes, and turn it out to dig in the mud.

Our lives are lengthened or shortened, by the observances or neglect of the rules of common sense and these do not require any great personal sacrifice Hyhiene simply means sanitary discipline and is derived from Hygeia, the Greek goddess of health.

The Greeks were an excellent type of manhood, and we read that their mothers used to take them down to the river in the morning, and dip them in. Then taking them by the hand, would run with them for three miles in the wind, that they might dry off. What would the people of conventional Canada say to this.

I believe in the old adage, that an ounce of prevention is worth a pound of cure and if we aim to lessen disease in children, pay more attention to health habits, we would have a race that had little need fo? nurses and doctors. There is nothing more beautiful than the glorious sunlight, and it is especially necessary for the healthy growth of children. Let its warming forces come freely into our dwellings, animate our spirits, prevade our homes and hearts with its joy, inspiring and health preserving influences.

NURSE.

A Good Thing.

Wr. Editor.—A certain bachelor friend of mine is continually rehearsing the virtues of a good wife. She must be a good cook, an economiral housekeeper, more or less of a home lover and home stayer. Some time ago he lost his heart to a nice little girl, and he made the remark that she would make a good wife for somebody because she had such a "sweet little face." maybe he is a great exception, but I don't think so. When a mans falls in love with a girl, he doesn't stop to think what she can do or what she can't —which is a good thing for lots of girls.—Ethel M. Johnston.

Love and a Cook Book.

Mr. Editor—Girls are accused of not knowing how to economize. Make inquiries into the case of any successful business man who started on a moderate income, and find out who did the economizing when such economy was nesessary. In nine cases out of ten, it was that "foolish," "frivolous" wife who doesn't "realize how hard it is for any young man to make a dollar."

The average girl cares infinitely more for love, a spirit of comradeship and partnership, than for the $15,000 income. Our bachelor friends fear they will not be properly fed—deluded creatures ! They have absolutely no means of knowing the domestic qualities of the girls they meet.

When a man calls on a girl, would he like to have her meet him at the door and ask if he would like to have his steak rare or well done; excuse herself, to appear a few moments later with her nose red and shiny and produce a well-cooked steak and perhaps a biscuit ? Or would he prefer to have her looking

I Present to You a "Health Belt Man"

He is 55 Years "Young"

Yes, 55 years young; not 55 old for My Health Belt poured vitality into his blood, nerves and tissues until

HIS VIGOR WAS RESTORED

My marvelous HEALTH BELT is a Wizard Worker, a mechanical self-treatment of the highest therapeutic value. It stands by you and never abandons its task until you are brought back to a state of vigorous Manhood, without an ache, pain or weakness. No drugs, no dieting, no restrictions of any sort, excepting that all dissipation must cease. Worn during the time you are sleeping, it opens its flood gates and drives a great, soft, warm stream of electric-vitality into your blood, nerve and weakened organs throughout the entire night; you sleep better for its use; it cures forever the weakness in your back; it seeks out and expels from your system all rheumatic pains. The electro-suspensory attachment is there for a purpose; it is the strong feature of my Health Belt, and delivers the electro-vitality to the parts most needing it. Courage, ambition

and a new view of life, with full self-confidence, surely result. It makes you young and keeps you young, with the fire and vigor of the biggest, fullest blooded man you ever saw. The "HEALTH BELT MAN" cannot grow old, for he knows the secret of perpetual youth. It will place you in the "feeling fine class." "I am a man again, thanks to your wonder-working Health Belt. Use my name as you see fit." So writes C. L. Snell, of Middleport, N. Y. So have said thousands before him.

YOU CAN PAY WHEN CURED.

If you're sceptical I'll prove it first. I'll take all risk by letting you have the Belt on Free Trial, not to be paid for until cured. Send it back if it doesn't do the work.

These Wonder Books are

FREE

Call or write for them to-day

Fill in the coupon and let me get these wonder Health Books into your hands. They are sent free, sealed, by mail, and give certain health and nature facts which every man (young, middle aged or old) should have. They fully describe my Health Belt, and are beautifully illustrated. I have known 100,000 men who sought my aid—I should know you.

DR. M. F. SANDEN CO., 140 Yonge Street, TORONTO, Ont.

Dear Sirs—Please forward me your books, as advertised, free.

NAME.....

ADDRESS.....

dainty and sweet, offer him a dish of delicious fudge? He has always given her the impression that he prefered the fudge, together with a good supply of small talk. But did it ever occur to him that the same hands were capable of cooking a substantial meal?

If a man really cares for the more practical and serious things of life, and thinks so highly of a girl's domestic ability and training, why doesn't he impart to her his interest in such matters? She is a most responsive creature and ever ready to pleate him. He indariably shows his preference for the "gay butterfliesf"

The subjects of domestic science and domestic art may not enter into her conversion, but the average girl understands household duties and responsibilities and would readily adapt herself to new surroundings and delight in making happy the man she loved.

Give the clever Canadian girl love and a good cook book and man need not fear starvation.—Mabel R.

The Sporting Spirit.

Do you think I would dare say that the girls in my "set" are not rightly brought up and trained? They would find it out somehow or other—they always do—and I should get an awful talking to.

As a matter of fact, I think they would get along pretty nicely in the harness. The amount of self-denial they would show in married life would depend a good deal on the husband. If they thought he was a pretty good sort of a chap they would be willing enough to sacrifice for their common good or the good of their children. Of course there are some who, if they had to cut down their personal expenses, would do so with a grieved air and think, if they did not say it, that they might have done better in the matrimonial market. But most of them are good sports, not given to self pity nor artificial ideals, and I think that with the right man they would be more than willing to do their share.

But I don't think they would think much of the self-denial part of it. They would simply look upon their married life as a new experience, a new situation in which, more than ever before, they had to discriminate between the really worth while and the unnecessary, and try, with what wisdom and money they had, to make life for herself and husband not only comfortable, but real and live and interesting.

As for "bringing up" and "training," I don't think these count as much as the girl herself, her ideals of life and her adaptability. It is all very well if she has learned the domestic arts; but if in so doing she has narrowed herself to the boundaries of the walls of a house, she has not her full power of enjoying life, married or single.

"Sporting spirit" is an usual term to apply to a woman, but it describes that spirit of taking adversity with a smile and going ahead that I find in many women' Many a girl that is "rightly brought up and trained" for matrimony in the eyes of the world lacks just that. She is more likely to bow to the gods of things as they seem to be. She is less likely to enjoy with her husband their hours of leisure. There are some girls in my set who would understand that a man would prefer to come home for a supper of bread and milk and a smiling wife than to a five-coflurse dinner and a worn-out housekeeper. Perhaps I am an exception, but I should prefer a wife who could share a little music or a good talk around the open fire to one who is conscious of her "responsibilities" that she sees none of the possibilities. For there are possibilities —possibilities in the home in the way of hospitality ehat is unprententious, possibilities outdoors in the way of unstilted recreation.

In short, I do not think that domestic training is necessary, and I think that if such training narrows her vision and her adaptability, she is better off without it. There are some girls in my "set" who can keep their feet on the ground and their heads in the air.

$1,000 for a Coat of Paint

It seems hard to believe, yet that is the sum of money that a coat of *Martin-Senour Paint 100% Pure* added to the selling price of a certain house.

For several seasons, a shabby weather-beaten house had been offered for sale. There were no buyers until a shrewd real estate broker purchased the property and, with a single coat of paint, magically changed it from a shabby house to that of a home of dignity—a home of comfort and elegance; furthermore, he sold it within a very short time clearing $1,000.

Nothing so preserves and maintains the value of your property like

Martin-Senour Paint 100% Pure

whose mission is to paint your buildings uniformly, economically, safely and surely.

The coat of Paint made the sale. Don't let your property depreciate in value for the need of paint.

If your dealer cannot supply you, notify us and we will gladly direct you to where our paints are to be had.

Down With the House Fly.

A bulletin issued by the Dominion department of agriculture contains an absteact of a lecture deliverev by C. Gordon Hew'tt D. Sc., Dominion entomologist, on the subject of "House Flies and the Public Health.' Its circulation is timely, for the fly season is near at hand. Pretty soon there wil, be a succession of hot days, and then the flies will be swarming.

Mr. Hewitt gives the house fly a very bad name. "It is,.' he says, "the embodiment of filth, swathed with the ger s of decay." He asserts that it carries on its body and legs bacteria of all kinds, and that no living fly is free from germs. Naturally, therefore, it is the common cartier and disseminator of all sorts of infectious diseases, but notably of tuberculosis, typhoid fever and infantile diarrhoea. Impure m lk is blamed for the slaughter of many innocents every summer, but the fact is that in many, if not most cases, the milk is made dangerous by flies reeking with infection. Typhoid and similar diseases of the intestinal tract are caused chiefly by flies. "In the South African and Spanish-American wars flies were responsible for more deaths than bullets," is Mr Hewitt's startling assertion.

The only effertive way to cope wit' the plauge of flies is to carry the war to the sources of the evil—the breeding places of the little pests. They breed in filth, preferably in decaying animal and vegetable matter, suth as accumulate in heaps of household refuse, and also in stables. Mr. Hewitt suggests two remedies. Local health authorities thould make it illegal to keep stable refuse exposed for more then six days—the time necessary for the development of the fly from the egg; garbage should be quickly and regularly removed and destroyed, and it should be compulsory to keep the garbage receptacle closed. It is suggested also that chloride of lime or kerosene be sprinkled over garbage after each addition; this treatment prevents flies from breeding.

If these suggestions were generally acted upon, there would noy only be much annoyance and inconvenience averted during the summer months, but the health of the community would be greatly improved and the rate of summer mortality would be cut down.

Here is a moth preventive recommended by a tailor and furrier. After thoroughly airing and brushing, put garments away in the usual chests, drawers or closets used for storing, but instead of using those evil-smelling tar and camphor combinations place in a corner of each chest or drawer a two-ounce phial of chloroform, uncorked. This not only keeps moths out, but kills any larvae which by chance might have eluded the vigilant eye of the housewife.—G. M. B.

Burned Suger—"Professor Trilbert of the Pasteur Institute at Paris has demonstraled that burning sugar develops one of the most powerful antiseptic gases known. The practice of burning sugar in the sick room was formerly regarded as an innoceent superstit on." If sugar were burned in the house when one member of the family has the grip or merely a cold, there would be less danger of its spreading throughout the household. This may be easily done by putting a few hot coals on a shovel or pan, sprinkling them with a tablespoon of sugar and letting it burn in the rooms where the sick person has been

Your old Carpets will make you handsome Rugs. Write for booklet mailed free.—THE MARITIME RUG WORKS, St. John, N. B.

Consumption Book FREE

This valuable medical book tells in plain, simple language how Consumption can be cured in your own home. If you know of any one suffering from Consumption, Catarrh, Bronchitis, Asthma or any throat or lung trouble, or are yourself afflicted, this book will help you to a cure. Even if you are in the advanced stage of the disease and feel there is no hope, this book will show you how others have cured themselves after all remedies they had tried failed, and they believed their case hopeless.

Write at once to the Yonkerman Consumption Remedy Co., 1592 Rose Street, Kalamazoo, Mich., and they will send you from their Canadian Depot the book and a generous supply of the New Treatment, absolutely free, for they want every sufferer to have this wonderful cure before it is too late. Don't wait — write today. It may mean the saving of your life.

Childish Fears.

There are few things more degrading to the moral nature than fear, the expectation of pain. Healthy being is impossible under its influence, and one of our earliest cares must be to prevent its even entering the atmosphere of a child's life. Timidity and courage are alike easily developed, and it is the business of the parents to foster the latter, while avoiding in every way to call the former into growth. It is, perhaps, not too much to say that upon the impressions and influences of the first seven years of our life depends our possession of the virtue of courage or our servitude to the demon of fear.

Man, both in his early and later years, has a dread of the unknown; to an infant everything is unknown; and it behoves its parents to watch that no new experience should come to it with fear. A sudden sense of helplessness in solitude may be dangerously terrifying to a baby. The dark is terrible, unless always associated with a sense of security and the mother's encircling arms. Children should never be put to sleep in a room without some shaded light, and the nurse within hearing of the slightest noise. If on waking they are not thus quickly reassured by light and attention, thay may suffer agonies of fear long before they can explain what they are feeling.

No children, however young, should ever hear disagreeable or frightening things said in their prenence. Ghost and goblin stories, murders and terrible descriptions of every kind, such as those in "Blue Beard" and "The Forty Thieves," ugly, uncanny mysterious, or painful pictures— everything capable o. exciting fear—must be avoided by the entire household. An imaginative child will contrive to build on the smallest mysterious suggestion, an image of dread which may haunt him for years. I have known a very young child lie awake night after night in agony after hearing two nursemaids speak of murder. The same child had a terror she never forgot from a ghost story told her by an indiscreet governess. Cases of other children are known to me who, after having been kept from all fear in their own home, heard ghost stories told, for the first time, while visiting, and grew to dread, all through the day, the approach of bedtime, and the dark, lonely bedroom in which they lay awake. Many people who look back to similar experiences in their childhood hold that some such hardening process is inevitable and salutary. The battle between unreasoning, instinctive fear and reasonable courage must indeed come in every life; but we should try to have it come when the faculties of reason and the virtue of courage are cultivated into strength, not even when, as in early childhood, the instincts are uncontrolled by any higher faculty, and unchecked by any experience of fact.

Equally vicious, but more visible in result, is the influence of fear inspired by threatened punishments, cross words, and angry gestures. We all, unhappily, know the leaden look the timid eyes, of children subject to these evils. I have known a sensitive child to dread scolding and impatient tones, even when not addressed to herself, with a shrinking which almost made her a coward for life. But the question of the punishment of children has not its place here; for the moment, we have not to deal with faults already engendered, and in need of correction, but with the training of the first blameless years of infancy; and in this training the perpetual sunshine of the moral atmosphere, the light and warmth of tenderness and love, is of all things first needful.

I have said that a child should be kept in ignorance of fear until it is old enough to be brave; but the experience and the lesson in courage may come unawares with some of the first impressions of the external world. I saw the other day a baby ten months old touch with her tiny fingers some fur on a dress. It was a new sensation to her, and she shrank from it with a comical horror, rubbing her little hand on her dress as if to get rid of some visible impurity. But the habit of examining new things was strong in her, and she presently touched the fur again and again, at first with a recurrence of her horror, then with dimishing dislike. The unknown became familiar to her, and gradually she came to touch the passive "pussy" with almost liking. The same child learned to stroke a gentle spaniel with complacence and love.

A white feather boa can be easily washed at home, exactly as one a warm lather, using two waters; rinse in clear warm water, and give would wash a delicate woollen scarf or shawl. Shake it lightly about in it a **final dip in slightly** blued ter. Tie or fasten the two ends together, so that it can hang over the line without breaking any of the feathers. A breezy day should be chosen and the boa shaken occasionally as it is drying. If the boa is an expensive one, it might be advisable to have it dry-cleaned the first time, but home-washing does admirably for second-best, and few feathers are lost if care is taken. For that matter, a boa returns from the cleaners much thinner than it went.

An enamelled pan is the most reliable of all to make "catch"—probably because it is so thin. A thick iron pan is the safest to use, and it should always be rinsed out with cold water immediately before the over with butter while wet, the milk will be yet more safe. As we have all experienced, a too fierce or flaming fire will cause milk to burn very milk is put in. If the pan be rubbed readily.

THRESHERS

Are you going to buy this season ? If so you want

The Sussex Little Giant.

Our New "Four Horse" Thresher.

Four Horse Size—Experience has shown us that Gasoline Engines are coming more and more into use for threshing purposes. With this power the demand is for a machine small enough to be moved from place to place with ease and yet of sufficient capacity to turn out a big day's work. Our Four Horse Machine has been specially built to meet this demand—A five to seven horse power engine will operate this machine with ease. It will turn out more work and work better than any machine on the market. Dimensions of Cylinder, 17x30; dimensions of sieve, 30½x36; speed, 900-1000; capacity, 500 to 1000 bushels per day; weight not mounted, 1900 lbs.; weight mounted, 2400 lbs.

Two Horse Size - For use with Two Horse Tread Power or small Gasoline Engine. Dimensions of Cylinder, 17x26; dimensions of sieve, 24x36; speed, 900-1000; capacity, 300 to 500 bushels per day; weight not mounted, 1400; weight mounted, 1900.

One Horse Size..For use with One or Two Horse Tread Power. A very handy and serviceable machine. Possesses all the conveniences of the larger machine. Dimensions of Cylinder 17x20½; speed, 900-1000; capacity, 100 to 200 bushels per day; weight 1000.

Apply to our Agent or write direct to the factory. We will be pleased to quote you prices and give you full informatiou.

Massey=Harris Mower.

Large, broad-faced Drive Wheels.

Four-powl Ratchets—no lost motion.

Finger Bar and Knife back are finest rolled steel.

Long wearing Plates on cutter bar.

Steel Clips hold knife in position.

Sections have hard edge and soft centre.

Raised Ledger Plates give long cutting edges—the serrated edges add greatly to the cutting efficiency.

THE MASSEY-HARRIS CO., Limited, Moncton, N. B.

Pasturing and Fencing Hogs.

In the first place, we should have rye and clover sown in the fall for the first spring forage. Select a good sized field or a field that can be plowed and worked to good advantage, and fence it off with hog wire fencing 3 feet high. Cut stakes and drive them in for posts. This fence does not cost much, and can be taken down and put up very quickly and is not expensive'

Next to your field of rye put in a ctop of rape, clover and barley; sow at the rate of 3½ pounds rape, six pounds red clover, and about one bushel barley to the acre. If you have not enough shoates, pigs or old hogs to keep this fed down (not let it get too rank), you can fence it off and hay it. One acre of this will keep eight or ten old hogs all summer without grain, and by keeping rye fed and cut down you can keep a number more. Plant sweet corn in a field near by, and don't forget to put in some pumpkin seeds with the corn, or plant seeds in hills by themselves.

Plow up the rye field in August and sow again to rye and clover. Fence it off, and the last of September or first of October it will make good feed, along with pumpkins, poor apples and what remains of your field of rape and clover and barley. If you are going to fatten your hogs you will see that your grain bill will not be large. To finish them off give plenty of water and a shelter. I use movable hog houses summer and winter. Hogs kept in this way through the summer get the land in nice condition for crops. The land that is used for rape, clover and barley must be well manured, or a good amount of commercial fertilizer applied. Rye does not requ;re as much. If you have any corn feed it to your old breeding stock through the winter. Buying so much western grain takes off the profits.—Frank Nye,

The Cost of Keeping a Cow.

Of course there is no general standard, even among well qualified dairymen there is a great difference in the cost of keeping as well as in the quality of the cows. Prof. Wing of Cornell College of Agriculture, in his address last winter before the New York Dairymen's Association, piled up a pretty heavy bill against bossy. Here are some of his figures:

COST OF FEED FOR ONE YEAR.

20 lbs hay, 180 days, 3600 lbs at $10.	$18.00
3 lbs. grain, 180 days, 1440 lbs. at $30.	21.60
26 week's pastkre at 38c.	7.80
	$47.80
One man to 20 cow's at $20: a month	24.00
Interest on $50, at 5 per cent.	2.50
Depreciation $50.—$25—$25. in five years	.00
Total	978.90

Prof. Wing credits the average New York cow with 4,500 lbs of milk or about 2,200 quarts at 3 cents a quart; we have $66. as her earnings or about $12. less than her keeping costs.

There is one thing to be said about these figures: No self respecting dairy farmer would consent to be represented by a cow that did not yield more than 4,500 pounds of milk, unless she gave six per cent. milk. It has long been a wonder where the average farmer came out of the hole.

Every man who "foresaw the evil" has hid himself behind a herd of cows giving six to seven per cent. milk and then his margin was small enough. It cannot be that we begin to know the dire pinch of poverty which the average cow imposes on the poor victim of her incompetency.—Hoard's Dairyman.

Physicing Horses.

(Continued from page 630.)

at once, and as super-purgation has caused many deaths among horses, and is always dangerous and difficult to stop, this fact should never be lost sight of. Even in cases of urgent need, and where constipation is most obstinate, no horse should receive a second dose of physic under 36 hours from the exhibition of the first. With cattle this is not a matter of so much importance, and one dose of purgative may follow on another in twelve hours or less, because the risk from super-purgation or causing inflammation of the bowels is quite remote.

Unless there is great urgency, it is always wise to prepare the horse for physic. This is done by knocking off all the grain, greatly reducing the hay, and giving warm bran mashes for 24 or 36 hours pzevious to administering the ball. If this is done, a smaller dose of aloes suffices, and the medicine acts with greater celerity and efficiency. After administration the mashes should be continued and the chill taken off the drinking water until the physic has "set". Twenty-four hours after the ball has been given, especially if the physic has shown no signs of acting, the horse should be led out for a few minutes, if it can be done without exposure to wet and cold, or walked round a loose box, but on no account should a horse be worked while in physic, or be set to any labor until the faeces have resumed their normal consistence. The practice of giving a dose of physic often without previous preparation, on Saturday night, and taking the animal to work early on Monday morning, is highly dangerous and to be strongly deprecated. Usually, four days is the minimum that should be allowed for recovery from physic before the horse is sent to work, and during the action of aloes, cold, cold water and corn should be avoided.

"SILVER PLATE THAT WEARS"

At the Reception

the silverware must be correct. Spoons, Forks, Knives, etc., stamped

"1847 ROGERS BROS."

meet every requirement of the mos elaborate social function. It's the accepted standard in silverware.

A PUBLIC WARNING

We wish to warn the public against being imposed on by unscrupulous dealers who substitute with cheap and worthless preparations designed to be imitations of Dr. Fowler's Extract of Wild Strawberry, the wonderful Bowel Complaint cure.

Pharmaceutical concerns are flooding the market with these cheap and worthless preparations, some of which are even labelled "Extract of Wild Strawberry," "Wild Strawberry Compound," etc.,—but they dare not use the name "Dr. Fowler," in the hope that the public may be deceived and led to purchase them, thinking they are getting the genuine "Dr. Fowler's."

Are you willing to risk your health—perhaps even your life, to these no name, no reputation, likely dangerous, so-called Strawberry Extracts?

Dr. Fowler's Extract of Wild Strawberry has a reputation extending over sixty-five years, therefore when you buy it you are not experimenting with a new and untried remedy.

It cures Diarrhœa, Dysentery, Colic, Stomach Cramps, Seasickness, Cholera Morbus, Cholera Infantum, Summer Complaint, and all Looseness of the Bowels.

Ask for "Dr. Fowler's" and insist on getting what you ask for. Price 35 cents.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

Three Bacterial Troubles of the Apiary—Know them and how to control them.

Much dissatisfaction with beekeeping as a business is caused by so-called "bad luck," which is really due to a definite bee disease which any beekeeper can learn to cure. Bees are quite as liable to disease as any other live stock, and to be able to treat such disease intelligently is quite necessary to success.

Bee moths are often blamed for the ravages due to disease; but moths never destroy a healthy normal colony, as they feed on the deserted combs after the bees are nearly all gone. Heavy Winter losses can often be attributed to disease. In fact, whenever a colony is not doing well the exact cause of its failure should be carefully sought to make sure there is no bacterial disease.

On the other hand, disease often makes its first appearance in the best colonies in the apiary, because infection is usually carried by robbing and that is generally done by strong colonies. If not checked on the start it soon spreads through the whole apiary, and from it to other apiaries in the neighboorhood.

The inspectors of apiaries can do a great deal for the health of bees but to be of real value their work must be supplemented by the earnest efforts of the individual beekeepers. Everyone should be his own inspector, carefully examining every comb of every colony in the apiary at least once a year, remembering that it is far better to detect it on the start in strong colonies than to wait until they are practically ruined and the disease has spread through the whole neighborhood. Only one cell of infectious disease makes is necessary to treat even the best colony in the apiary. And because one has kept bees for a number of years without seeing a case of disease is no reason why it should not make its appearance this year. Plenty of people have died of smallpox after having escaped it for fifty years.

When a case of infectious disease is suspected the beekeeper should go ahead and treat the disease according to directions given in this bulletin.

EXAMINING APIARY FOR DISEASE.

The disease which cause the most damage attack the developing brood, causing much of it to die in the comb, and so reducing it that the colony soon dwindles from lack of young bees to replace the old.

When examining an apiary for disease the prime consideration is to avoid robbing. The best time is during a good honey flow as early as possible in the season.

It is necessary to have a good smoker, a hive tool for taking out combs, and a supply of wooden toothpicks for testing the brood.

First go over the apiary and blow a few puffs of smoke into every entrancef This will check the bees for a time from coming from other colonies to try to rob the hive that is open. In opening the hive just enough smoke should be used to keep the bees in subjection. Remove each comb in turn from the broad chamber and examine the brood. It is best to sit on a box close to the hive with your back to the sun, and hold the comb so it will shine into the cells, and throw a strong light directly on the lower sides and bottoms of the cells. If there is no disease, the empty cells will be bright and clean, and the uncaped larvae will be plump in form and of a pearly white color. At first a number of cells or caped brood should be opened with the pick, until you are quite familiar with the outward appearance of healthy caped brood. Cappings which to any but the best trained eye appear quite healthy often cover dead larvae. When diseased cells are present they are quite frequently found around the lower edge of the comb. If any of the brood cappings appear darker than the rest or are flat, sunken, or perforated, they should be opened to see whether the brood thay cover is dead. Healthy brood is sometimes found under darkened, flat, or perforated cappings; but there is a difference in appearances which experience soon teaches one to detect. Brood sometimes develops without ever being fully capped; this is not known to be an indication of infectious disease. When each hive is finished the pick used there should be left in the hive, and if any honey is daubed on hands or tools they must be washed thoroughly before opening the next hive.

There are three brood disease prevalent in the apiaries of Canada; American Foul Brood, European Foul Brood, and Starved or Pickled Brood. The first two are known to be infectious, the last in not so considered, although its cause is not well understood.

AMERICAN FOUL BROOD.

This disease is caused by bacteria known to scientists as Bacillus Larvae (not B. Alvei, as was formerly supposed). It reaches the healthy young larvae by means of infected food unsuspectingly fed to them by the nurse bees. In most cases the larvae dies when nearly ready to seal up. and most of the cells containing infected larvae are caped. The dead larva softens, settles to the lower side of the cell in a shapeless mass, at first white or yellow, changing to coffee color and brown. At this stage it becomes glutinous, so that if it is is picked with a toothpick the contents will rope out half an inch or so when the pick is slowly

Agricultural College, Truro, Nova Scotia.

Next Session of Full Course Begins NOVEMBER 1st, 1909.

Next Short Course for Farmers and Farmers' Sons Begins JANUARY 3rd, 1910.

Next Short Course in Domestic Science, Dairying, Horticulture and Poultry for Ladies Begins JANUARY 4th, 1910.

Three hundred and fifty [350] students enrolled in the various classes during the past session. A large increase is expected next session.

Tuition FREE to all students from the Maritime Provinces

A farmer's son attending the College, can take a full course in the various branches of Agriculture, Horticulture, Dairying, Poultry Raising, Veterinary Science, etc., and at the same time, in English, Mathematics, Book-Keeping, Political Economy, the various Sciences and other lines regularly studied in High Schools and Colleges.

Requirements for entrance are familiarity with farm practice and an ordinary school education. The College is especially adapted to the needs of farmers' sons who have had an opportunity to acquire a school education and now wish to improve their knowledge in all lines.

Students completing the two year course at Truro can enter the third year at Guelph, St. Anne de Belle Vue or any of the American Agricultural Colleges.

For full particulars apply to,—

M. CUMMING, B. A., B. S. A., - Principal Agricultural College, - Truro, N. S.

withdrawn. It adheres to the cell so it cannot be lifted out entire. It has the odor of a poor quality of glue. When the larva dries it forms a tightly adhesive scale, of very dark brown color, which cannot be removed without tearing the cell wall.

Where the infected larvae are caped the cappings turn a darker color and become flat or sunken, the workers perceiving that something is wrong usually start to tear off the capping but, discovering the condition of the contents, they generally leave it with a small perforation in the centre until quite dry, then the capping is removed, and in time honey may be stored in the cells containing the scales of disease. The millions of disease spores then float out into the honey, which becomes a medium for carrying the disease to other healthy larvae by robbing in the same or some other apiary. Some of the honey is also carried into the supers, to make room for alternations in the brood nest, and is marketed in the form of bottled or section honey. It goes into many homes especially in towns and cities. The wooden sides of the sections, and many of the empty bottles, or washings from them, are thrown out ly housekeepers and cleaned up by bees in the neighboorhood, and the disease carried home to their healthy brood. This is how our inspectors find more disease in the apiaries around towns and cities than elsewhere.

Now to be cured of this disease a colony must be freed from all this infected brood, comb and honey. To do this we simply take it away. But in the operation some precautions are necessary. We must see that the colony will get healthy food as soon as the unhealthy food is taken away and have means for building new comb at once. So the operation should be performed during a honey flow, and to make it perfectly sure it is a good plan to insert a division board feeder of sugar syrup. We must take precautions against starting robbing, or causing the treated colony to scatter to other hives or swarm out, be lost, and carry infection to other places. So the operation should be performed in the evening, when the bees are settling down for the night, and the entrance should be covered with queen-excldding metal to hold the queen in case of swarming out the next morning. A regular queen-excluder laid on the bottom board under the brood chamber will answer the latter purpose. Whenever bees are disturbed in their hives they fill their honey sacs with honey from the combs. As this will happen when the hive is being treated, and some of this diseased honey may be stored in the new combs, it is thought best to remove these after three days and require them to make a second start.

METHOD OF TREATMENT.

We shall use what is commonly called the "McEvoy Method." When there is a good honey flow, go to the colony in the evening, remove it from its stand, and set in its place a clean disinfected hive containing clean frames with small foundation starters, and if convenient a division board feeder with thin sugar syrup. The entrance of this hive must be covered with queen-excluding metal. Now shake the bees from the combs of the old hive into the new; but if any fresh nectar flies out in shaking it will be necessary to brush instead of shaking. Get these combs immediately under cover, and clean up very carefully any honey that may be around, so robbers from healthy colonies cannot carry home disease.

When the diseased colonies are weak in bees, the bees of two or three should be put together into one clean hive, so as to get a good-sized colony to start the cure with.

On the third evening after the first operation the starters and what combs have been built must all be removed, even greater care being taken than at first to avoid shaking out thin honey. This time the bees are given full sheets of foundation, and the cure is complete. To make sure however, the brood must be examined again in about three weeks.

The old combs and the first set of starters must be either burned or melted and boiled thoroughly before the wax is fit for use again. The honey that has been removed is entirely unfit for bee feed. Even after it has been boiled for a full half-hour it is not safe. The only way to dispose of it is to dig a deep hole and bury it.

If the disease is discovered late in the season, and the colony is still strong, leave it until November, take the diseased combs away, and supply honey from a healthy colony, in full sealed combs. Be sure that that the combs are all sealed, and that they are from a colony which has no disease.

Brood from badly diseased colonies is of no value and dangerous, and should be burned, buried or otherwise destroyed at once. Brood from colonies having only a few cells diseased might be placed over an average colony slightly diseased, and the queen caged. When most of the brood has hatched, treat as given above.

Combs free from pollen that have never been used for brood rearing that are white and clean, and have been dried from all honey before the colony was treated, are reasonably safe for use as super combs. As a rule, however, it would pay better to melt them into wax and use full sheets of foundation. All doubtful combs should be melted down.

Hives which have formerly contained diseased colonies, or in which diseased combs have been stored or carried, should be burned over inside with a gasoline or oil torch.

EUROPEAN FOUL BROOD.

Until the last two seasons the only infectious brood disease known to exist in Ontario was the one described aboue. But another kind has made its appearance. It is called European Foul Brood (spmetimes "black brood.")

European Foul Breed has destroyed the apiaries in great areas of different States in the Republic to the south of us. It is now known to be rampant in at least one section of Canada. In one way it is much more to be dreaded than American Foul Brood, because it runs its course and destroys an apiary much more rapidly, and because the adult bees will carry out the disease scales and scatter them in the yard and farther, to find their way into healthy colonies.

In the part of Ontario where it is known to be apiaries were wiped out at first something like this :

112 colonies reduced to 23 in two years.

180 colonies reduced to 21 in one year.

60 colonies reduced to 44 in one year, and the balance all deseased the second year.

The symptoms are easily distinguished from those of American Foul Brood, as there is no ropiness, and the odor is different. The larvae mostly die without uncoiling from their natural early position. The color in the earlier stages is lighter than in American Foul Brood. The odor is very pronounced and offensive, like decayed fish; in fact, on a warm moist morning, it is noticed on entering the apiary, and when a diseased comb is held up for inspection is almost sickening.

The McEvoy treatment is effectual if applied to the whole apiary at once, even though only a few colonies show the symptoms. Even then the cure is only permanant when pure-bred Isalian queens are introduced to the affected colonies. It is quite impossible to cure an apiary of black bees of European Foul Brood without introducing pure Italian queens to all colonies.

We know of no reason why we should not expect this plague to sweep over Canada as it has over most of the United States. If it does, all apiaries of black bees will be practically destroyed within the next few years. Its progress in the one district mentioned above has been appalling. No Government expenditure can touch the situation without the intelligent co-operation of the men themselves whose property is in danger. There is a remedy, however, right at hand. Pure bred leather-colored Italian bees are almost immune to this disease, which works so much havoc among the common blacks.

It is very important, then, that all

(Continued on page 642.)

FARMER'S SONS !

Why not Learn Telegraphy ?

All over the country today "Railroad and Telegraph Companies" are endeavouring to get reliable, trustworthy Operators. The demand is greater than the supply—Good men are scarce---It's the golden opportunity for the young man with Brains and Ability.

A Complete Course for Railroad Students.

The G. T. P. School of Telegraphy and Railroading

which is the most complete school of its kind in Eastern Canada,—is now preparing hundreds of young men to fill positions of trust, as railroad operators.

We teach the only Practical Course which is endorsed by Railroad Officials. Our Class Rooms are completely equipped with Stations, Instruments of Local and Main-Line Circuits. Students get the actual experience in sending and receiving "Messages," "Train Orders," etc.

We educate Our Students in "Telegraph Construction," and all its branches; teach them the proper care and use of Telegraph Instruments, Switch. Boards and Batteries.

Railroad Operators Get Big Salaries

The pay for Railroad Operators ranges from $50 to $175 per month, according to ability. But this is not all—think of the vast opportunities offered in the Railroad field for young men who are industrious and reliable. Big corporations like the **Grand Trunk Pacific** who have millions of capital, are entering the field, and there is absolutely no limit to the advancement offered to the young men with Push and ability.

Positions Waiting for Our Students

We are continually receiving at our "Office" requests from Railroad and Telegraph Companies for trained men, and it is an easy matter for us to find good positions for our students as fast as they fit themselves for practical work.

Don't let this chance slip by. Sit down right now and write for our Special rates to all who enroll during the present month. Rates of tuition advance 20 per cent August 15th.

Enroll Now and save money.

FOR FULL PARTICULARS ADDRESS

W. T. LITTLE, Principal, - FREDERICTON, N. B

The Composition of Hay.

Now that the hay harvest is fast approaching, it is an opportune moment for asking ourselves, At what stage of growth should we cut the hay crop, in order to obtain the maximum amount per acre of nutritive matter throughout an entire season? It must be noticed, first, that we are to consider the yield of nutritive matter per acre; and second, that our view must extend over a whole season. It would be quite misleading to select certain species of grasses in our field or meadow, and fix the best time for cutting with reference so the amount of nu-

trient materials in these alone; we must make our analysis on a fair average sample of the whole crop when cut, and then calculate from that the total amount of digestible matter per acre. Thus we might find in a field of ryegrass and clover hay that, while the ryegrass had become over-ripe, and so less digestible, the increase in the amount of clover obtained by delaying cutting for a few days was more than sufficient to compensate for any such decrease in the nutritive value of the hay crop. This brings us to our second point.

We may delay cutting and so get a larger crop, both of total produce and of nutritive matter, but if this increase be obtained only at the expense of the aftermath, then our total yield of nutritive matter for the season may suffer. And there is always a great danger of this occurring. If we cut the clover plant while it is still in the vegetative condition, or at least before it has begun to mature its seed, then in the natural course of events it will produce an abundant aftermath; but once the vegetative period has ended, once seed-production has begun, then we need hardly expect to have such a large aftermath. As with the clovers, so with the grasses. Hence arises the popular and thoroughly scientific practice of cutting the hay crop just when the "bloom" is going off the ears of the grasses. At this stage, the grasses are found to contain the highest possible proportion of digestible matter for a hay crop, although in the majority of cases the clovers will not yet have reached their maximum growth. The farmer, however (instinctively, it may be), considers in what way he can best obtain the highest yield of nutritive during the whole season- and is unwilling to sacrifice the aftermath for the sake of a larger hay crop. He calculates, and rightly, too, that after flowering the grasses do not increase in total weight, and he knows from experience that stock do not so thoroughly relish hay which has been allowed to ripen its seed before cutting. Still, it cannot be denied that many farmers do err by allowing the grasses to become too ripe before cutting, in the hope of getting a larger yield of hay owing to tee continued growth of the clovers. As a general rule, it is safer to commence cutting even before the bloom is completely off the grasses, for not only may harvesting operations be delayed by unfavourable climatic conditions, but it may also happen that, where there is a large area to be dealt with, the later cut fields may be over-ripe before we can get at them, unless we commence in good time.

Date of Cutting.	Nitrogenous Substances: Abuminoids.	Nitrogenous Substances: Amides, &c	Fat	Soluble Carboey-drates	Fibre.	Ash
May 14	11.5	6.2	3.2	40.8	23.0	15.3
June 9	9.4	1.8	2.7	43.2	34.9	8.0
June 26	7.8	0.7	2.7	43.3	38.2	7.3

The figures given in each case the percentage of the ingredient in the dry substance. In another table, the same author shows the influence of age upon the digestibility of fodder plants. The meadow hay above referred to was fed to sheep, and the following co-efficients were obtained :—

Date of cutting		Proportion of each Constituent digested for 100 parts supplied. Total Organic Matter.	Nitrogenous Substance.	Fat	Soluble Carbohydrates	Fibre.
May	14	75.8	73.3	65.4	75.7	79.5
June	9	64.3	72.1	51.6	61.6	65.7
June	26	57.5	55.5	43.3	55.7	61.1

Now let us see how far we are justified in assuming that the nutritive value of the grasses and clovers diminishes as ripening proceeds. Here we must appeal to the chemical analyst, for, although the farmer satisfies himself on this point, as on many others, by appealing to the cow or to the horse, this is scarcely a reliable enough trial for the scientific observer. What we have to show is that, as ripening goes on, the percentage of the valuable digestible materials in the stems of the plants decreases. It is true there may be an increase of nutritive matter in the seeds, but in the case of grasses and clovers these have not proved suitable feeding stuffs either for man or beast. In general, we may say that, as the plants mature, "the proportion of water, nitrogenous matter, and ash constituents diminishes, while the proportion of carbohydrates and fibre increases; at the same time, the amides become more or less converted into albuminoids," which have, it is true, a much higher nutritive value.

Warington, in his "Chemistry of the Farm," gives the following table to illustrate the changes in compps-ition which take place in meadow hay as the grasses pass from the green state (14th May) to rhe flowering condition (9th June) and then to maturity (26th June) :—

Here we see very clear,y the marked difference in digestibility berween ordinary pasture grass and over-ripe (mature) hay, and if the experiment had been made with horses instead of with sheep, the diffecence would have been more accentuated. And numerous experiments, both on th Continent and in America, corroborate Warington's conclusions, both as regards composition and digestibility.

Enough has been said now to show that, even if we consider the hay crop alone, no advantage may be gained by delaying the cutting past the proper time—i.e., just when the "bloom" is going off the ears— for the increase in quantity may be counter, and perhaps even over-balanced, by the coincident decrease in quality—i.e., in digestibility.

In conclusion, the writer may say that he is well aware that there are other considerations which might have been touched upon in this paper, and which might have to a certain extent nullified the conclusions come to. For example, in a mixed crop of ryegrass and clover, it may well happen than an increase in the proportion of clover in the hay may render is more palatable to stock, and therefore perhaps more digestible. But these are, after all, subsidiary questions, which do not greatly effect our main argument for cutting hay just after flowering has occurred.—Scottish Farmer.

High Temper in Bulls.

High temper is an indication of the prepotent power in breeding. Some of the best sires in the world have been sacrificed right in their prime because they grew ugly, when it would have been well worth while to place borne with them much longer for the sake of the cows they could produce. Such bulls need hard work every day, on the tread power or in harness, to keep down their superabundant energy. Nothing tames high tempered men, horses and bulls, like plenty of hard work.

But we must never forget that the bull is the fountain head. This is just as true in poor qualities as in good. "The other day," says Hoardjs Dairyman a farmer in this vicinity spoke to us about the bad mistake he made at the start in buying a poor registered bull because he could get him cheap. He said it wodld have been money in his pocket, if he had paid $500 for a bull that was worth it rather than to have used the bull he did."

Ingalls' Rhapsody on Grass.

Next in importance to the divine profusion of water, light and air, those three great physical facts which render existence possible, may be reckoned the universal beneficence of grass. Exaggerated by tropical heat and vapors to the gigantic cane congested with its saccharine secretion, or dwarfed by polar rigors to the fibrous hair of northern solitudes, embracing between these extremes the maize with its resolute pennons, the rice plant of southern swamps, the wheat, rye, barley, oats and other cereals, no less than the humble verdure of hillside, pasture and prairie in the temperate zone, grass is the most widely distributed of all vegetable beings and is at once a type type of our life and the emblem of our mortality. Lying in the sunshine among the buttercups and dandelions of May, scarcely higher in intelligence than the minute tenants of that mimic wilderness our earliest recollections are of grass; and when the fitful fever is ended, and the foolish wrangle of the market and forum closed, grass heals over the scar which our descent into the bosom of the earth has made, and the carpet of the infant becomes the blanket of the dead.

Grass is the forgiveness of nature —her constant benediction. Fields tramped with battle, saturated with blood, torn with the ruts of cannon, grow green again with grass, and carnage is forgotten. Streets abandoned by traffic become grass grown like rural lanes, and are oblitered. Forests decay, harvests perish, flowers vanish, but grass is immortal. Beleagured by the sullen hosts o winter, it withdraws into the im pregnable fortress of its subterran ean vitality and emerges upon th first solicitation of spring. Sown by the winds, the wandering birds, propagated by the subtle horticultur of the elements which are its minis ters and servants, it softens th rude outline of the world. Its tenac ious fibers hold the earth in its place, and prevents its soluble com ponencs from washing into the wast ing sea. It invades the solitudes of deserts, climbs the inaccessible slopes and forbidden pinnacles of mountains modifies climate and determines the history, character and destiny of nations. Unobtrusive and patient, it has immortal vigor and aggression. Banished from the throughfare and the fields, it bides its time to return, and when vigilance is relaxed, or the dynasty has perished, it silently resumes the throne from which it has been expelled, but which it never abdicates. It bears no blazonry of bloom to charm the senses with fragrance or splendor, but its homely hue is more enchanting than the lily or the rose. It yields no fruit in earth or air, and yet, should its harvest fail for a single year famine would depopulate the world.

The PUBLISHER'S DESK.

The Windsor Supply Co., of Windsor, Ontario, are selling their Windsor Cream Separators direct to the consumer, instead of through agents. They claim it is the most economical method and that they are able to sell their machines at about half the usual figures. They will send description and prices on request.

Summer Cruises in Northern Seas. —In connection with inauguration of the Grand Trunk Pacific Steamships on the Pacific Coast on June 12th, the Company has issued a very handsome and interesting booklet describing the new boats and the scenic

Peerless Lawn Fence

Is Strong and Attractive. All the wires are uniformly crimped, large gauge, steel spring wire, heavily galvanized and coated with white enamel paint. Never sags, never rusts. Improve your property with a Peerless Fence. Cheap as wood and more handsome and durable. Also full line of farm and poultry fence and gates. Write for information.

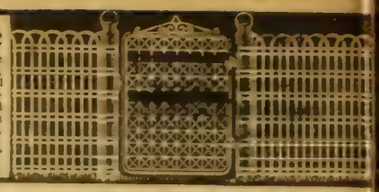
Dept. K, Hamilton, Ont., Winnipeg, Man.



FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, **free** of any charge, my **home treatment** with full instructions to any sufferer from women's ailments. I want to tell **all** women about this cure—**you**, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourself at home without the help of a doctor. Men **cannot** understand women's sufferings. What we women know **from experience**, we know better than any doctor. I know that my home treatment is a safe and sure cure for **Leucorrhœa** or **Whitish discharge, Ulceration, Displacement** or **Falling** of the **Womb, Profuse, Scanty** or **Painful Periods, Uterine** or **Ovarian Tumors** or **Growths**, also **pains in the head, back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles** where caused by **weakness** peculiar to our sex.

I want to send you a **complete 10 days treatment entirely free** to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that **it will cost you nothing** to try the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week, or less than two cents a day. It will not interfere with your work or occupation. **Just send me your name and address**, tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you **free of cost**, my book—"**WOMAN'S OWN MEDICAL ADVISER**" with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it and learn to **think for herself.** Then when the doctor says, "You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures **all, old or young.** To **Mothers of Daughters**, I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness, and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this **Home Treatment** really **cures** all women's diseases and makes women well, strong, plump and robust. **Just send me your address**, and the free ten days' treatment is yours, also the **book.** Write to-day, as you may not see this offer again. Address:

MRS. M. SUMMERS, Box H 309 • WINDSOR, ONT.

randeur of the trip from Seattle, ictoria or Vancouver to Prince .upert.

There are thirty-two pages of text iatter, full of information and new iaterial, carefully prepared after a ecent trip over the route. The pub.cation is profusely illustrated with irand Trunk plates made from direct hotographs, and include pictures of he new boats, scenes in Seattle, 'ictoria, Vancouver and Prince Ruert, forest scenes on Vancouver Isand, Indian villages on the route, ictures of the majestic scenery of he inside channel, and a series of eautiful scenes on the Sveena River. n addition, there are diagrams of he steamships and a new and comlete map of the North Pacific Coast howing in a clear way the steamhip route.

The cover of the booklet is a triking one, printed in four colors. Copies of this publication can be ad free on application to J. QUINLAN, D. P. A., Montreal.

"The Wyandottes."—We are just n receipt of a revised edition of a book entitled "The Wyandottes" published by the Reiable Poultry Journal, Quincy, Ill., and find that it is an authoritative est book and instructive treatise deoted to the different varieties of Wyandottes, viz:Silver Laced, Golden, White, Buff, Black, Silver Penciled, Partridge and Columbian. The est and illustrations are based on he changes to appear in the 1910 American Standard of Perfection, and the book is invaluable to breedrs of Wyandottes who wish to anicipate future Standard requirements. It was edited by J. H. Drevenstedt, a breeder and judge of twenty-five years experience.

"The Wyandottes" consists of 160 pages 8 ½ x 11 ½ printed on first-class paper and is bound in heavy paper with a handsome embossed cover design. It is fully illustrated by Franklin L. Sewell, A. Of Schilling, I. W. Burgess and others, and in addition to eight full-page latest typo Wyandotte charts by Sewell, there are three Sewell color plates of Silver Laces, White and Partridge Wyandottes.

The price of "The Wyandottes" is $1.00 per copy, postage prepaid.

Growth of Rural Telephones.—To anyone who travels the country roads, one of the most striking features is the continuous evidence of the growth of the rural telephone. Even the most remote and sparsely settled parts of the country have their strings of wired poles, spreading like a network along highway after highway and branching off here and there to take in some farmhouse that, were it not for the connecting link of electricity, would indeed be isolated.

Pleasant View Farm For Sale.

Farm in best fruit section of Annapolis Valley containing 115 acres land. About 40 acres orchard, 2000 trees mostly apples, but includes pears, plums, etc., 1¼ acres raspberries Good pasture and plenty of wood, fine place for dairying. 3½ miles from Middleton and Wilmot, 1½ mile from church, ½ mile from school, daily mail. 8 room house, barn room for 10 head cattle and horses, barb wire fencing, soil varies from sandy loam to clay loam with clay subsoil. Reason for selling, owner engaged in other business which requires all of his attention. For price and terms apply to the owner.

GASOLINE ENGINES
FOR FARM, FACTORY AND BOAT
SEND FOR CATALOGUE & PRICES
AMHERST MOTOR CO. AMHERST, N.S.

The call of the telephone bell is no uncommon sound in the farmhouse today. Men are called for the threshing, prices are learned, buying and selling is done, orders go to the butcher and the grocer and friendly gossip and chat are all among the many things that keep the busy rural lines buzzing. The farmer with a telephone is no more isolated than his brother in the city, indeed, often far less so; for the city man as a rule, does not know his next door neighbor. The farmer knows everybody and thanks to the wonderful invention of Prof. Graham Bell, can talk to them all any day or minute of the night. To comment on the value of the telephone to the farmer, from the standpoint of prices and markets would be almost superflous when one considers to how greas an extent the instrument is used for just this purpose.

"My telephone," says one farmer," has, I calculate, paid for itself fifty times over since it has been installed. The times when it has told me to sell and the times when it has told me to hold for higher prices, are numerous.

"More than that, our company is only a little independent concern owned just among ourselves. Yes, I suppose you can credit me with a good part of its organization," he said in response to an enquiry. "You see, it happened this way; I noticed the advertisements off one of the big electrical supply houses and got interested. I wrote these people for their book on the organization of rural telephone companies and they sent me full information on how to proceed. They told me everything I wanted or needed to know, told me a lot of things that I never even knew there was to know. They told me not only about their telephones themselves, but posted steps that I had to take to organize. All I had to do when I gat that information was to go out to my neighbors and you bet, I was able to answer anything they asked me. Say we had a telephone company organized and operating almost before you would know it and there's not a single one of our men today who would go back to the old way of doing without a 'phone for anything.

"No, it didn't cost us much. There's nothing prohibitive about the cost and, as I told you, we own the company among us. Last year, we paid a good dividend and it will be only a question of a few years till we have back every cent we invested and a telephone service into the bargain. Our running expenses are almost nothing, just the cost of maintenance and the salary of a girl at central. It's not worth speaking of. That's one advantage, you see, of a co-operative company such as ours.

"It's a surprising thing to me that more farmers don't organize telephone companies of their own. I believe they're doing it now more generally than they used to but there are lots more that would and could organize if they only knew how simple it was to get started and how great the benefits were.

"If there's one thing that I would advise more than another, it would be for some farmer in every locality to write in to one of the big telephone supply-houses and find out what they have to tell him. There's no reason either, why one man could put it off expecting another to do it; write yourself. Rural telephones are a thing a farmer can't know too much about, especially when there are concerns who are ready to tell him everything and not charge him a cent for the information.

"All I ever invested for the knowledge was a two cent stamp and I read over the books they sent me in the evenings.

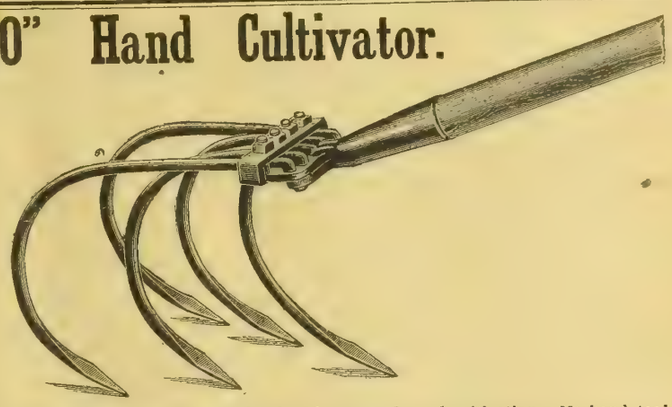
"BUCO" Hand Cultivator.

Handle 4 1-2 Feet Long



The secret of growing things is largely freedom from weeds, and cultivation. No hand tool ever made will destroy weeds and loosen soil like the "Buco." and it does it easily. It's a labor saver and a crop grower. Teeth are oil tempered steel and adjustable to different widths. If you want a nice, clean, healthy garden use a "BUCO."

Sold by hardware trade. If your dealer cannot supply them, write us direct.

Manufactured by
Bailey-Underwood Co., Ltd., New Glasgow, N. S.

This Serviceable "Swiss" Army Rifle For $3.50

We have in stock about twenty of these "Swiss" Army Rifles which we would like to dispose of. Having purchased a large number of these rifles for premium purposes we necessarily got them at a bargain and are now offering them to you at wholesale prices. The shooting season is over and we do not want to carry so many in stock. They retail at all hardware stores for about $6.00 each. Ammunition for these rifles is cheap and can be obtained at almost any hardware store in the provinces. If your dealer does not keep it we can get it for you- Every farmer should have a rifle and this is your opportunity. Better send for one to-day. They will not last long at the price quoted, $3.50. Orders filled in rotation. If all are sold when your order is received money will be refunded. Order to-day. Cash must accompany order. If you send check add 25c for exchange.

SEAMAN, Moncton, N. B.

Three Bacterial Troubles of the Apairy

(Continued from page 638.)

apiaries, especially in or near infected neighborhoods, should be Italianized at once, without waiting for a destructive outbreak of disease.

STARVED OR PICKLED BROOD.

A disease slightly resembling Foul Brood is called by some "Starved Brood," and by others "Pickled Brood." The most positive difference in the dianosis of this disease is the absence of ropiness and of the glue pot smell, which are always found in American Foul brood. In Pickled Brood the larva decays from the inside leaving the skin tough and in its ratural shapr; in E. F. B. or A. F. B., the skin of the larva softens as the contents become glutious, and all the natural wrinkles become smooth as the mass settles to the lower side of the cell. In P. B. the larva often dries up so as to become loose in the cell and fall out when the comb is inverted. In A. F. B., it always cements fast to the lower cell wall, so it cannot be removed without tearing the cell. E.F.B., attacks the larva generally at an earlier stage in its existence than P. B.

The cause of Pickled Brood is not definitely known. It is not considered to be infectious. McEvoy asserts that it is caused by an insufficient feeding of the larvae, due to a sudden check of the honey flow, or a constitutional weakness of the workers. The latter he charges to inbreeding of the queens. Re-queening with vigorous queens from other apiaries will often effect a cure and it often disappears of its own accord.—Ontario Department of Agriculture.

MARKETS.

Charlottetown Prices.

Grain.—Oats 34 to 42c.

Feedstuffs.—(Retail) Bran $1.15 to $1.25; Shorts $1.30 to $1.35; Middlings 1.35 to $1.40; Oil-Cake $2.00 to $2.25; Corn Meal $1.75.

Live Stock.—Butcher's Cattle 5 to 6c. live weight; Milch Cows $35, to $55.00; Sheep 4 to 4½c; Lambs $2.75 to $3.50; Young Pigs, pair, $6.00 to $8.00.

Dressed Meats.—Beef (Carcass) 9½ to 10½c; Mutton (Carcass) 9c.; Veal 5 to 5½c.

Dairy Products.—Creamery Butter 22c. solid, 23c. pts; Dairy Butter 17 to 19c; Cheese 10½ c.

Poultry and Poultry Products.—Eggs 14½c; Fowl 12c.

Fruit.—Strawberries 12c box retail. Potatoes 25c, to 35c.

Miscellaneous.—Hay $10.00 to $10-50; Straw $6.00; Wool Wool 22c., to 25c; Beef Hides 8c; Calf Skins 10c; Sheep skins 75 to $1.00; Lamb skins 15c; Quohaugs 70c.

Trade in general has been fair since our last report, produce markets are still in rather bad shape but potatoes are in better demand, blues are reported rather scarce and some inquiring for reds. Farmers can now get 25 to 30 c. for blues and 20 to 25c. for Reds. Hay on the other hand is easier and the demand limited with generous supplies offering. The prospects of a heavy crop this year is causing farmers to push off the surplus stocks and is having a depressing effect on the market in general. Oats is about unchanged with very little moving and a wide range of pfices, whites for shipping are worth about 34 to 36c but with very little changing hands and dealers who have stocks on hand which cost 42 to 42 c, last winter are not willing to accept today's prices and are not willing to buy more unless at reduced prices. Black oats are scarce and are in small supply and bring from 40 to 42c, for shipping and the bulk of what is offered goes to supply the local demand at the outside figures in some cases a cent or two more. Butter is dull, supply is ample for present demand and there is a wide range between Dairy and Creamery. Factory men might be disposed to accept lower prices than our quotations for round lots as we understand there is quite a lot accumlating at some of the factories. This was cheese board day and there was boarded about about 3000 boxes, almost all of which sold at 10½c. One or two factories did not sell on the board and it is understood that they realized 1.16 more, which would equal last board day 10 9-16. Eggs are lower and the market weak 14½c., is the outside price today for full count job country points. Conditions are most favourable for an abundant harvest.
July 8th, 1910.

St. John Prices.

Grain.—Oats 45c. bushel.

Live Stock.—Milch Cows.—$30.00 to $60.00.

Dressed Meats.—Beef (carcass) 6 to 11c; Beef (Retail) 10 to 25c., lb; Mutton 6 to 9c; Veal 6 to 10c; Lamb 14 to 15c; Pork 10 to 11½c.

Dairy Products.—Creamery Butter 24c; Dairy Butter 18 to 21c; Cheese 13 to 14c.

Poultry and Poultry Products.—Eggs 18 to 20c. doz.; Fowl 70 to $1.30; Chickens 50 to $1.00; Ducks 60 to $1.00; Turkeys 14 to 22c, per lb.

Vegetables.—Potatoes $1.00 to $1.30; Turnips 60 to 85c bushel.

Miscellaneous.—Beef Hides 9c; Calf Skins 15c; Sheep Skins 15 to 20c; Lamb Skins 35c.

HAD HEART T

LIFE WAS A BUR

MILBURN'S HEART AND NERVE PILLS CURED HIM.

Mr. Elexander McKay, Port Philips, N. S., writes:—"Seeing testimonials in the B.B.B. Almanac of how many poor sufferers had been helped by Milburn's Heart and Nerve Pills, I thought mine would not be amiss. I am a man of fifty-four years, and have a family of five children. About two years ago I was a sufferer from heart trouble, and life was a burden to myself as well as others. I could not lie on my left side and sometimes I would nearly choke, and was very nervous and run down. My father, a very old man of eighty-five years, told me that he often heard people recommend Milburn's Heart and Nerve Pills to be a great cure so thought it would do no harm to give them a trial, but I had very little faith in them. My wife went to the store and got me two boxes, and before I had used the last of the first box I noticed a change, and before the second box was done I was cured and am a well man to-day."

Price 50 cents per box, or 3 boxes for $1.25 at all dealers, or mailed direct by The T. Milburn Co., Limited, Toronto, Ont.

SEALED TENDERS addressed to the undersigned and endorsed "Tenders for supplying Coal for the Dominion Buildings" will be received until 4.00 P. M., on Tuesday August 16 1910, for the supply of Coal for the Public Buildings throughout the Dominion.

Combined specifications and form of tender can be obtained on application to this office.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Honourable the Minister of Public Works, equal two ten per cent (10 p. c.) of the amount of the tender which will be forfeited if the person tenderling decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By Order,
R. C. DESROCHERS,
Asst. Secretary.

Department of Public Works,
Ottawa, July 6, 1910.

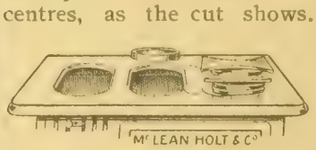
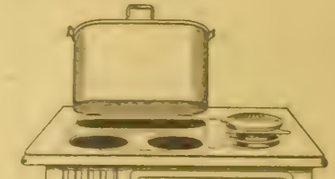
If You Want to Save Trouble on Wash Days, Then Buy a GLENWOOD RANGE.

Yes, when you have a Glenwood Range in your home, you can shift your wash boiler to the back of the stove by shifting the centres, as the cut shows. The Glenwood Ranges have been proven a success by the hundreds that are using them.

We are getting enquiries for them all over the Maritime Provinces, which shows that the Glenwood Ranges are taking a hold through the provinces as well as in St. John, where they are made. We have the stoves that the people want and we neither spare time or money to make them just what we say they are.



This cut shows section before changing.



This cut after changing.

We prepay all freight to your station. Send for our Catalogue. We have Ranges from $25.00 up.

Butter Defects and How to Correct Them.

The following extract from a bulletin, written by Prof. M. Michels, of the University of Wisconsin, are intended as a ready reference that will aid the butter maker in locating the common defects found in butter; their probable cause and a remedy that may be applied.

A DEFINITION OF GOOD BUTTER.

Flavor: should be rich, pleasing, creamy and suggest nothing objectionable to either the taste or smell.

Body, should be firm and waxy.

Color, should be even showing a luster and an oat straw shade unless the particular market wants a dfferent color.

Salt, well dissolved and just enough to bring out the highest flavor of the butter.

Package, clean and neat in appearance.

BUTTER FLAVOR DEFECTS.

I. Curdy Flavors: Indicated by a sour cottage cheese smell and taste.

Causes: 1. Adding wheyed-off starters to the cream.
2. Adding an over-ripe starter while the cream is at too high a temperature.
3. Ripening a very thin cream at a high temperature.

Remedies: 1. Do not use a starter that shows whey on top.
2. Never add a high ripened starter until the cream is cooled
3. Cream should test 30 per cent or more butter fat, a lower testing cream should not be ripened much above 60 degrees F.

II. High Acid Flavors: Indicated by an excessive sour smell and taste.

Causes: 1. Over-ripening of the cream before churning.
2. The use of an over-ripe starter.
3. Receiving part of the cream in an over-ripe condition.

Remedies: 1. Develop less acid in the cream before churning.
2. Do not use a starter having over 0.70 per cent acid.
3. Cream containing over 0.50 per cent of acid should not be mixed with sweeter cream, but churned separately.

III. Lacking Flavor: Lacking taste and smell.

Causes: 1. Churning the cream too sweet.
2. Too much washing of the butter granules.
3. By using a dead or inactive starter.

Remedies: 1. Cream should not contain less than 0.45 oer cent of acid, even when a light flavored butter is wanted.
2. When butter is churned at low temperatures, one washing or rinsing is sufficient.
3. Never use a newly prepared starter until it sours readily.

IV. Rancid or Old Cream Flavors: Smells and taste like old cream or old butter.

Causes: 1. Over-ripening the cream.
2. Holding the ripening cream too long before churning.
3. Ripening the cream at very high temperatures.
4. Holding some of the cream or milk too long before churning.
5. Keeping the butter at too high a temperature after churning.

Remedies: 1. When cream is kept over night to be churned the next morning, it should not contain more than .55 per cent of acid.
2. Cream should not be cooled down after ripening with the idea that it will keep its fine, creamy, acid flavor until churned several hours later.
3. Start ripening the cream below 68 degrees F.
4. Old or over-ripe cream or milk should not be mixed with sweet cream, but churned separately. Milk or cream, even under the most favorable conditions, should not be kept longer than two days.
5. After churning, keep the butter in the refrigerator at a temperature of 50 degrees or below.

V. Oily or Greasy Flavors: Indicated by an oily and greasy taste and smell.

Causes: 1. Holding the milk or cream at too high a temperature before delivering to the creamery.
2. Ripening, churning and working when at too high a temperature.
3. Using a poor grade or too much butter color.

Remedies: 1. Hand-separator cream should be cooled to 60 degrees within an hour after separating.
2. Do not ripen the cream above 65 degrees F. Churn and work at low enough temperatuee so that one washing of the granules will take out all of the butter milk, it will then be in such condition that the butter will not turn greasy while being worked.
3. Never use bad smelling color or one that has a sediment at the bottom; use no more color than is necessary to satisfy your trade.

Vl. Fishy Flavors: Indicated by a bad taste and fishy smell.

Causes: 1. Uncleanliness in handling the cream and milk at the farm.
2. Leaky cream or milk vats at the creamery.
3. May be produced by certain species of bacteria.

Remedies: I. Keep separators, pails, cans and takns for cooling clean at all times.
2. Never use a leaky vat, dipper or can for handling milk or cream.
3. If produced by certain species of bacteria it is certain that they grow in dirt, hence cleanliness is necessary.

VII. Stable Flavors: A bad taste and cow stable smell.

Causes: 1. Uncleanliness in milking.
2. Keeping the cream or milk in or near a dirty cow stable.

Remedies: 1. See that the stable and cows are clean before milking and milk with clean, dry hands.
2. All milk should be removed from the stable as soon as milking is finished. Never keep the milk or cream near the stable or manure piles.

VIII. Bitter Flavors: Indicated by a bitter taste.

Causes: 1. Holding cream too long a time at low temperature before churning.
2. May develop in the starter.
3. Bacteria brushed from the cow's udder while milking.

Remedies: 1. Cream should not be held at well-water temperature more than two days. Bitter flavors are often noticed in cream which is hung in the well or set in the spring for three or four days.
2. Set the starter with a small amount of mother starter at 70 degrees F. rather than a large amount at 55 degrees. (One quart of starterline to 100 pounds of pasteurized skim milk is sufficient.)
3. Milk clean cows in clean stables by clean hands.

IX. Weedy and Food Flavors: Indicated by weedy and food smell.

Causes: 1. Cows feeding on weeds.
2. Feeding strong scented food just before or during milking.
3. Exposing milk in an atmosphere laden with objectionable food flavors.

Remedies: 1. By giving cows a plenty of good pasture feed they will not eat weeds wnough to flavor the milk.
2. Do not feed silage, brewer's grain or slightly decayed feed shortly before or during milking.
3. Do not keep milk in the same room with feed of any kind.

X. Unclean Flavors: Unclean smell or taste.

Causes: 1. Dirty cans and milk utensils.
2. Dirty water may cause an undesirable aroma, but nothing objectionable to the taste.
3. Impure air and dirty starter may give an undesirable taste but nothing objection able in aroma.
4. When the judges fail to find words to describe a flavor, this expression is used as a last resort.

BODY OR TEXTURE DEFECTS.

1. Weak Body: Soft and weak when pressed with thumb or finger; sometimes coarse in appearance.

Causes: 1. Ripening, churning and working at too high temperatures.
2. Cream not cooled long enough before churning.
W 3. Too much moisture in butter.
4. Character of the butter fat.

Remedies: 1. Ripen, churn and work the butter at as low a temperature as practicable.

Houdan Cock.
Bred and owned by Dr. G. W. Taylor, Houdan Specialist, Orleans, Ind.

2. Remember that with cream churned right after being cooled down from 60 degrees, the churning temperature may have to be lowered to 50 or below, while cream kept at 55 over night may be churned safely at 57 to 58.

3. By employing the ordinary methods of washing and working not over 16 per cent of moisture will be left in the butter.

4. Change the feed of the cows. This trouble is seldom found in the butter fat from mixed herds.

II. Greasy Body: No grain, dead in appearance.

Causes: 1. Over-churning of the butter.

2. Over-working.

3. Washing the butter granules in too warm wash water.

4. Churning and working at too high temperatures.

Remedies: 1. Stop churning when the granules are about the size of wheat kernels.

2. Work the butter no more than is necessary.

3. Never use wash water above the temperature of the buttermilk when drawn.

4.Churn at low temperature so that the butter granules will not stirk together while washing.

III. Body Showing Too Much Moisture.

Causes: 1. Stopping the churn when the granules are too fine.

2. Under-working the butter.

Remedies: 1. Churn granules to the size of wheat kernels.

2. Work but once and until smooth and waxy.

IV. Mily Brine.

Causes: 1. Churning at too high temperatures.

2. Over churning.

3. Improper washing.

Remedies: 1. Churn at lower temperatures so that the granules will will not stick together.

2. Churn until the granules are about the size of wheat kernels.

3. Fill the churn with wash water to about the same height in the churn as the cream occupied when the churning started.

V. Color: Mottled appearance.

Causes: 1. Uneven distribution of the salt.

2. Using too cool or too warm wash water.

3. Not enough moisture in butter when worked.

4. Churning too warm.

Remedies: 1. Distribute and work the salt evenly.

2. Have the wash water about the same temperature as that of the buttermilk when drawn.

3. Leave enough moisture in the butter so that the salt will readily dissolve while working.

4. Churn the cream at a temperature low enough to prevent the granules from sticking together and allow the buttermilk to be washed out, then salt is quickly and more easily distributed and dissolved. Streaked butter is simply a mild case of mottles.

VI. Color Specks: Tiny color specks which appear throughout the butter.

Causes: 1. Using a poor grade of color.

2. Allowing the color to become too old.

3. Keeping the color at too high a temperature.

Remedies: 1. Buy only the best grade of color.

2. Buy in small quantities.

3. Never keep the color near a radiator or boiler.

VII. Salting Defects: Indicated by taste.

Causes: 1. Too course, gritty.

2. Unevenly distributed.

3. Too low or too high.

Remedies: 1. Leave enough moisture on the granular butter and work sufficiently to dissolve the salt.

2. Distribute evenly and revolve the churn a few times before setting rollers in motion.

3. Too little salt often fails to bring out the best flavor. Too much salt leaves a coarseness of taste that covers up the fine, creamy flavor so much desired in butter.

Houdan Hen.
Five years old and still laying. Bred and owned by Dr. G. W. Taylor, Orleans, Ind.

VIII. Package Defects:

Causes: 1. Bad appearing, dilapidated package.

2. Badly trimmed and dirty on top or sides.

3. Butter not packed solid.

Remedies: 1. The package and covers must look neat and clean and not be too old.

2. Cut top of butter with a string or wire and wipe the dust out of the cover before placing it on the tub.

3. Pack small amounts of butter in the tub at a time and use the packer after each addition. Strip the tub from the butter occasionally and note the appearance of the butter surface.

Our Prince Edward Island Letter.

Editor The Maritime Farmer :—

An unusually, warm, early spring with an abundance of rain, followed later by cool, cloudy, damp weather in June has again demonstrated the value of fertile, well cultivated soil, as extreme conditions of weather always do.

Early sown grain on good soil has come along well and promises, at this writing, July 12th, a very heavy yield. Later grain, especially on cropped out land, looks washed out and hungry, but as we have had several days of warm, ideal weather it may come out alright yet, as grain is the hardest of all farm crops we grow, to form any correct estimate of, up to the very time of harvest.

Hay, where the land is at all rich, will be the heaviest crop in years. Seldom have we seen so much clover in our second cut, and pastures are ideal being full of white clover and fresh as in early Spring. This is indeed the dairyman's year, never have we seen fall calved cows, or any other milk cows for that matter, keep up such a regular flow, although I never could see why the large majority still think it profitable to keep cows idle practically all winter feeding just about enough to lose what is fed, and then land their cows on the grass in the spring so thin that they again lose the first flush of grass, picking up what should be kept on them in winter.

A Grand Houdan Pullet.
The making of a fine Exhibition Hen. Bred and owned by Dr. G. W. Taylor, Orleans, Ind.

With all that is published in Farm journals these days in every concievable form along with the numerous lectures on this subject, trying to rub in the common truths that are well known to every intelligent stockman:

How a certain amount of food is required to sustain the cow, only what she consumes above that can profit be made from.

How, if we keep her eating five days what she could digest or assimilate in three we haue wasted two day's feed.

How much easier it is to keep a well conditioned animal gaining, than to start a thin one up.

How much just a little more feed added to what lets a cow grow thin would have kept her gaining.

How necessary it is to develop a good dairy cow (and more especially a heifer) that we keep her fattening when she is dry.

How easily and natural it is for a cow to put on fat rapidly the last two months before calving. We who have ever dressed a "has been" for beef will have noticed the immense amount of tallow stored around the intestines and kidneys, nature storing away for the extra strain of feeding the calf. All these and many such truths are accepted by almost every intelligent man, but only a very few will put them into practice, and we repeatedly see cows yet carrying their old hair in June.

If our farmers, and those who would be dairymen, could be made to understand all the very many other advantages of intelligent feeding such as the fact that when we feed well at any season we not only receive more milk at the time and greater profit but the effect of that same feed will be noticable through the entire year. That is if we feed well in summer the flow will be kept up for a longer period and greater profit will result from fall and winter feeding and if we continue in winter the effect will be felt during the next summer. Our heifers will be many times better cows and accidents and loss from sickness due to poor condition will be much less common.

We are having institute meetings during the past few weeks over almost all the province, addressed by experts, in different branches of agriculture, from the upper provinces.

Just how much value these meetings are it is difficult to estimate, but I am afraid that few of the men most neediog this education attend. Although this would seem to be the most suitable time of year for holding these meetings, still the long twilight of our sdmmer euenings now keep men from assembling in anything like decent time as few will go to a meeting before the lights are on. Garden parties, picnics and the like often butt in and these meetings cannot stand such opposition. And while much is often to be learned (though not always) at these meetings, nothing influences any given district, nothing increases or promotes the sound dairy sentiment, like "demonstration" dairy work. Let any number or even one farmer begin to make a success of any special line and the effect is at once noticed around even amongst his critics, and could we drop an up-to-date Danish or other successfull dairyman in every settlement we would have done more to influence the province to this line of farming than any number of lectures will ever do, (not that we despise them either). Dairying would mean for this province what no other line of farming that now is, or can be carried on, could do. We here are limited to our 1,000,000 acre farm, our only hope for development is to build on top of that acerage. Just what it would mean to make every acre doubly productive, to carry twice as large a population on the land and double as many in our towns and villages with little increase in keeping up our public utilities I will leave your readers to estimate.

And when we can make the man who says "give me manure and I will farm as good as any of them" understand that he can grow all the manure that he has a mind to, that he can create conditions on his farm that will assure him a steady increased yield of crop and manure, and at the same time yield him greater profits than shipping his grain produce would do, then and only them can we make this province the little Denmark that nature intended it.

We have here a moderately costing fertile and easily cultivated soil, a cool, moist climate, the cheapest labor, and the best market in Canada, a temperate climate, a country noted for its beautiful scenery. When will we awake to our possibilities and check this mad rush to the west, overlooking opportunities fully as great and a much more desirable country in which to live.—W. M. Lea, Victoria, P. E. I.

Farm Drainage Operations.

(Continued from last Issue.)

SIZE OF TILE.

The size of tile in the main drain depends upon three factors, namely, the quality of soil, number of acres to be drained by this main, and the slope of both main drain and laterals Below is a table worked out by McConnell and recopied from a report from Prof. W. H. Day, which will act as a general guide :

TABLE OF SIZE OF TILE PIPE OF MAIN (McCONNELL.)

Fall.	Acres Drained.					
	3-Inch Tile.	4-Inch Tile.	6-Inch Tile.	8-Inch Tile.	10-In. Tile.	12-In. Tile.
1 foot in 20	18.6	26.8	74.4	150.0	270.0	426.0
1 " 30	15.1	21.8	60.4	128.0	220.8	346.0
1 " 40	12 9	18.6	51.6	108.8	189.6	398.4
1 " 50	11.9	17.0	47.7	98.0	170.4	269.0
1 " 60	10.9	15.6	43.4	90.0	156.0	246.0
1 " 70	10.0	14.5	39.9	83.0	144.4	228.1
1 " 80	9.3	13.4	37.2	77.0	135.0	213.0
1 " 90	8.1	12.6	35.0	72.5	127.0	200.5
1 " 100	7.3	11.9	33.1	69.2	120.6	190.5
1 " 150	6.7	9.5	26.6	56.0	97.3	154.4
1 " 200	5.7	8.2	22.8	48.0	83.9	132.5
1 " 250	8.1	7.5	20.4	42.4	74.4	117.0
1 " 300	4.6	6.9	18.4	38.2	65.5	107.0
1 " 400	4.1	5.9	16.5	32.6	60.3	90.7
1 " 500	3.7	5.2	14.8	30.1	54.0	81.6
1 " 600	3.3	4.7	13.3	28.0	48.6	74.0
1 " 800	2.9	4.1	11.4	24.0	41.9	65.0
1 " 1000	2.6	3.7	10.2	21.2	37.2	56.0
1 " 1500	2.1	3.0	8.5	16.8	30.8	47.0
1 " 2000	1.9	2.8	7.4	15.0	25.0	40.8

DEPTH AND DISTANCE APART.

These two factors are, to a certain extent, controlled by the size of tile. The distance between drains depends largely on the kind of soil. In general cases underdrains in clay soil should be no more than 45 feet apart; in sandy soils 75 to 100 feet, with the average depth of, say 3 feet. This would hardly apply to swamp lands, nor can any fixed rule be laid down. However, in soils needing drains this will act as a guide. In both above cases the water table would be about 1½ feet from the surface, at a distance midway between the two lines of tile. But if the depth of these tiles be only 2½ feet then the drains must be closer together in order to keep the water table sufficiently low. Drains must be placed below frost level, and then deep enough as neehed to insure satisfaction. Knowing that the water table is curved higher between drains than at the tile, we would advise digging drains from 3 to 3½ feet in depth, but owing to the many influences in our irregular land surfaces and formations, each farmer has a distinct problem and knowing his condition better than others must use his own judgment.

MAPS AND RECORDS.

How many farmers who have underdrained could tell exactly where each drain is located? And what of his successors? It takes but a short time to make a complete map of the farm with all drains charted exactly to a convenient scale. This, with other records, should be both useful and valuable in locating obstructions in tiles, or in constructing new drains.

ESTIMATE OF COST.

The pertinent question is, how much will drainage cost? Let us consider in order, the various items of expense. After a more or less careful survey of the land by either farmer or surveyor, the number of tile needed is known. The cost and weights of the same may easily be obtained from the nearest factory, and expense of freight and hauling readily estimated per ton.

As to the cost of digging, we have already stated that this depends largely upon the nature of the soil. This work is usually contracted for, and estimated per rod. Digging by hand a ditch 3 feet deep in heavy soils, the cost would be from 65c, to 70c. per rod, and on light soils, the cost would be 30c. to 40c. Digging by hand and plow, the cost would be lessened, in the former case to 40c. or 50c., and in the latter 25c. to 30c. per rod. The digging machine previously mentioned will greatly lessen this outlay. This machine is manufactured by the Buckeye Traction Ditcher Co., of Findlay, Ohio, there being several models, but the machine purchased is an average size for digging to a depth of 4½ feet. Where these machines have been used, the average charge per linear rod is 7c. for each foot in depth, or 21c. per rod in a 3-foot ditch. Add to this 2c. per rod for fuel and 1½c. per rod for the board of two men, the total coss is 24½c. per rod. This machine digs from 90 to 120 rods per day easily and owners make big money, while compared with other methods, the farmer saves. This machine, purchased by the Nova Scotia Government, will be used in as economic a manner as possible to cheapen cost, to stimulate drainage, and perform this operation for the farmer when, owing to dryness of midsummer or a lack of labor, other methods would be impossible.

The cost of filling ditches with the team and scraper if from 10c, to 15c. per 100 feet, as compared with 25c. to 35c. when done by hand. Provided the farmer does his own surveying, laying out of drains and superintending, all costs have been included.

Before closing, I would like to draw the attention to the possibilities of disputes as to outlets or drains running across neighboring lands. "The Drainage and Water Course Act" (Chapter 67, Vol. 1, Revised Statutes for Nova Scotia, 1900,) provides for such contingencies. According to this Act, owners of adjoining lands are compelled to give natural outlets for drainage water, and assist in sharing the expenses for the same. It also provided necessary appointments of engineers, inspectors, contractors, etc., as well as the regular procedure according to law should there be any disputes over the same. Limited space permits only the mentioning of this Act, but by so doing it may aid someone in perplexity over such matters.

As to the profits and benefits of drainage, much might be said. Surely if drainage will make our soils earlier, better aired, sweeter, warmer, deeper, and more drought resistent; if it will give proceeds from waste land which before drainage produced nothing; if it will double the annual production of many other areas, or diminish the costs of management and farm operations by reason of doing away with rough, broken fields, open ditches, etc.; if it will change diseased breeding swamps barnyards, etc, into useful productive healthy estate; if it will do all this and much more, then it is not worthy of our most careful consideration.

It has been the aim of the writer to suggest a few practical improvements to farmers uninterested in or using older and inefficient methods of drainage. Few of these ideas are original, but have been gathered from various sources and experiences, but all are practical and easily understood. May the interest in this most important need of drainage grow rapidly. The results have been proven highly profitable, financially and otherwise, in almost every case.—Prof. E. S. Archibald in 1909 Report of the Nova Scotoa Department of Agriculture.

Description of the Buckeye Traction Ditcher.

Among the many labor saving devices used by the farmers, should be classed the ditching machine. This is an appliance to cut drainage ditches for ordinary tile, and, as proven by actual test, it does the work better, faster and far more economically than is possible by hand-labor.

Drainage is no longer an experiment, but a necessity. Proper drainage is always a good investment, at least causing a heavier production and of better quality. It is therefore of interest to note any improved method pf accomplishing this end.

Of the several makes of such machinery, mention will be made only of the one which, in the writer's judgment, is the most satisfactory and efficient to meet varying conditions.

The Buckeye Traction Ditcher (manufactured by The Buckeye Traction Ditcher Co., Findlay, Ohio, U. S. A.,) has been on the market for thirteen years, and is a machine in wide use throughout the United States and Canada. Those being operated in this country are said to be giving good results. As Canada is a big field, one needing extensive improvements, it is well to consider the adaptability of such an invention to our local conditions.

The Buckeye Traction Ditcher is built on the principle of a traction engine, on the rear end of which is mounted an excavating wheel provided with excavating buckets fastened to its circumference, as shown in the accompanying illustration. This excavating wheel is an "open wheel;" that is, it has no axle, but revolves upon anti-friction wheels placed outside the rims of the cutting wheel. The excavating buckets connecting the two rims, have a top and back, but no bottom, being rather bowl-shaped. As the wheel revolves, each bucket cuts off a slice of earth, filling it, and the dirt is then carried over a steel stationary arc fastened between the rims, to the top of the wheel and dropped upon the belt conveyor. The stationary arc prevents the excavated earth from falling out of the bucket until it reaches a point above the conveyor.

The cutting wheel, which can cut to a depth of almost two-thirds its diameter, is revolved by means of a pair of driving sprockets. The latter mesh with segmental gearing directly above the actual cutting surface so that no power is lost in transmission. This excavating wheel, it is further explained, is supported between two steel beams, which can be raised or lowered to any depth within the machine's capacity. The rear end of the excavating wheel frame is supported by a post, to the lower end of which is fastened a shoe. The latter slides along the bottom of the finished trench, giving stability to the wheel also, because of its design, catching all crumbs and leaving the ditch and bottom in the shape of the tile.

Side cutters are bolted to the rims of the large wheel, which prevent the buckets sticking in the trench.

The machine excavates the full depth of the trench at one cut, leaving the bottom clean and exactly in grade. A level, sight-arm and flag-poles with sliding targets are provided with which the operator gets the desired grade by raising or lowering the cutting wheel. A curve can be cut to the right or left when desired.

The cost of operation varies according to the size of the machine used. A Buckeye cutting a ditch 11½ inches wide by 4½ feet deep, (this being the smallest Ditcher built) requires only two men, one operator and one helper, whose combined wages need not exceed $4 per day. About one-third of a ton of good soft coal, and one gallon of water for each pound of coal, are sufficient to run the machine ten hours. The manufactures guarantee any of their machines, when properly handled by a competent operator, to cut in soil that is favoranle at the rate of 3 lineal feet per minute, 3 feet deep, and greater or lesser depths in inverse ratio. It is claimed the Ditcher can average between 100 and 150 rods of trench per day, in good soil conditions.

In localities having a sticky "gumbo" soil, special open-back excavating buckets are used instead of the regular solid buckets for dry ground. When small stones are encountered, the machine excavates them along with the dirt. If the stones are too large to be carried in the buckets, the operator can close the throttle, reverse his engine, and jar the obstruction loose enough to be lifted out of the trench by hand.

Among other advantages claimed for this ditcher may be mentioned the following :

(1) That its use obviates the heavy expense and delay always incident to the employment of hand labor.

(2) Simplicity of operation enables

SPECIALIZING ON BREEDS BY DISTRICTS.

Mr. Jas. McLay, a prominent figure at all our Maritime shows some years ago, when associated with the Chamcook Farm, St. Andrews, N. B., but now in charge of the Wyoming State sheep flock and assistant lecturer on animal husbandry at the Wyoming Experiment Station, accompanied by Prof. Faville, Chief of the Animal Husbandry Department of the said station, were in Sussex and other points in the Maritime Provinces last week, selecting some pure bred dairy cattle, of various breeds, some sheep and some swine for their station.

Mr. McLay's friends were all glad to see the genial Scot again. He still has a deep interest in the East and says, that although they might have procured stock nearer home, he believed they would be well repaid for going so far afield, as he was of the opinion that there was less disease among Maritime flocks and herds than among those further West. He has kept in close touch with the doings of our Maritime breeders and is quite conversant with the show yard winnings of the respective herds.

This is Prof. Faville's first visit to the Maritime Provinces and he was much impressed with what he saw. He says that if the farmers of Maritime Canada would specialize in breeding by sections, so that a purchaser could go to the district of A and there buy a carload of Holsteins or to district B for Jerseys or to district C for Ayrshires, without having to travel so much and entailing so much expense in getting a carload of any particular breed, as at present, buyers would be in the field nearly all the time, buying up, at profitable prices, all the surplus stock they could procure.

"A word to the wise is sufficient."

Come again, Bro. Faville.

THE OBJECT OF AGRICULTURAL SHOWS.

Exhibitions do more perhaps than anything else to impress upon everybody the importance and magnitude of agriculture.

They are the farmers' shows and it will do for the farmers to make them the best and make the best of them. It is one of the great advertising mediums for the farmer. It is where he puts his fine stock and produce before the public in their most attractive form. It is where the farmer can learn what the other man is producing, make his acquaintance and get pointers for his own good. Without these public competitive events, the live stock breeds would not be so rapidly improved. It keeps breeders alert for defects in their own and strong points in the other man's stock. It affords an opportunity to see, examine and buy good breeding stock, and to sell what he has for sale.

It is a duty the breeder owes himself, his herd, his country and his state to become an exhibitor at the fairs. There is no better advertising medium than that of being in the show ring at your county and provincial fair. Stock raisers and farmers in general, who have need of improved breeding animals, at once recognize quality, and they reoognize prominence in standing of the various herds just as well. The breeder, who desires to "get into the game," must necessarily place himself in position to get acquainted with the public and have the public know who he is and where he is located. The local fair affords one of the best means of securing this.

But aside from this, the exhibitions are great educational institutions in many ways. The farmer goes and learns a little of city ways. He has to see—unless he is blind—what the great world is doing with his products. He learns what the public demand, what sort of package is best. He learns all about the newest machinery and can compare many makes.

CANADA'S NEXT CENSUS POPULATION.

The next census of Canada will be taken under date of June 1st, 1911, and will embrace the subjects of population, mortality, agriculture, manufacturers, minerals, fisheries and dairy products.

Population will be recorded under the heads of residence and personal description; citizenship, nationality and religion; profession, occupation and trade or means of living; wage-earnings and insurance; education and language spoken, and infirmities.

Every person living on 1st June will be entered on the schedule of population by name, as member of a family, institution or household, together with place of habitation, sex, relationship to head of the family or household, and whether single, married, widowed, divorced or legally separated. The month of birth, year of birth and age at last birthday will also be recorded.

Entries will be made for each person to show the country or place of birth, year of immigration to Canada if born elsewhere, year of naturalization if formerly an alien, and also racial or tribal origin, nationality and religion. Every person of alien birth, who has become a naturalized citizen, is a Canadian by nationality; and every British subject with residence in Canada, as well as every native of Canada, who has acquired citizenship by birth or naturalization, is also a Canadian by nationality. But there is no Canadian by racial or tribal origin, unless the Indians are so counted.

Every person having an occupation or trade will be entered for it, but if employed in the census year at some other occupation for part or whole time, he will be so recorded also. If the person is working on own account, the entry will be so made. An entry is also required to be made showing where the person is employed, as on farm, woolen mill, at foundry shop, in drug store, etc.

Wage-earners are entered to show the number of weeks employed in 1910 at chief occupation or trade; at other than chief occupation if any; the hours of working time per week at chief occupation, or at other occupation if any; the total earnings in 1910 at chief occupation; the total earnings at other than chief occupation; and the rate per hour when employed by the hour.

Entries are required to be made for each person showing the amount of insurance held at date of the census upon life, as well as against accident or sickness, together with the cost of such insurance in the census year.

Under the heading of education and language records will be taken for every person of five years of age and over, showing the number of months at school in 1910, and if the person can read and write, and the language commonly spoken by each person. The cost of education in 1910 for persons over 16 years of age at College, Convent or University is also called for.

The last question on the schedule of population relates to infirmities. It calls for a record of each person having an infirmity. If blind, deaf and dumb, crazy or lunatic, idiotic or silly, a record thereof will be made in the proper column, and the age at which the infirmity appeared is required to be specified.

VALUE OF PASTURE LANDS.

There has never been a proper appreciation of the real worth of the pasture lands in this country. All lands were naturally pasture, or regarded so, and used as lands to turn stock onto for grazing or occupying as a pasture. This has been true since the first settlement of the country. Even the wild native timber lands and forests were looked upon and regarded as pastures by our forefathers.

It has always been the practice with the pioneer settler to select the smoothest land, the acres most readily turned to cultivation, as the farm land, the land to be cropped, leaving the rougher, poorer and least productive to be pastured. Pasture lands from the beginning of time have been discriminated against, as a kind of waste; tracts when not good enough for easy cultivation from any cause were good enough for pasture, be they rough, stony and hilly, or wet, boggy and swampy lands.

The farm pasture has usually been a piece of ground that made itself, so far as grass is conserned. It has been taken possession of naturally or voluntarily by the native grass and white clover grasses which follow the conditions of cultivation as well as weed crops and neglect of various sorts These pastures commense early in the spring to send forth their crops, and persistently continue until the late autumn season checks growth of vegitation. It must be observed that these refuse fields, and often untillable tracts' when spring opens up at once take the place of the winter feed, hay and grain, a very expensive proporation of feed that is prepaired on all farms at consiperable cost. They not only serve as a substitute, but they actually exceed all prepared feeds in conditioning and fleshing up the farm stock. The sick and enfeebled animals at once take on new vigor and life when turned on the spring pastures, thus demonstrating the superior value of the pasture grass over any other form of farm crop as a feed.

The time has now come when the pasture must be credited for what it is worth. Instead of leaving the pasture to catch and develop from year to year, it has become necessary to make pastures, and make them to produce two or three times the amount of feed that they formally supplied. Many farms do not contain any rough or untillable lands that are fit for nothing else than pasture—can not be put to other use. Such farms must have pastures, notwithstanding their good, even quality of lands. They can have much better pastures, producing much more grass, and it is the duty of the farmer to proceed in the cultivation of a pasture. This can be done by sowing a variety of pasture and hay grasses; as the sod thickens up the distinctly pasture grasses will take possession of the land.

The dairy business, for instance, is suffering today all over the country for need of more and better pastures. Pastures produce milk cheaper than do the prepared feeds, and there is nothing that will exceed good pasture in quantity and quality of milk. The cow owner that wants to get the greatest advantage out of his milk product should not neglect the making of first class pastures for his cows. The milk product during the grazing season is the cheapest produced through the year and most profitable for the dairymen.

Does Concentrated Food Pay in Milk Production.

Editor The Maritime Farmer .—

I, as a dairyman, enclose herewith a cutting from The Dairy World and would very much like to see the subject discussed in your columns. My own idea is that, here in Canada, it pays to feed concentrated feed to cows even in summer, when the pastures are at their best.

A. OWEN PRICE.

Annapolis County, N. S.

Following is the article refered to :

DOES CONCENTRATED FOOD PAY IN MILK PRODUCTION ?

The question of the economic value of concentrated food in the production of milk has lately been receiving the attention of practical dairymen, and judging by the remarks of Mr. Primrose McConnell in The Agricultural Gazette, it seems that the views hitherto generally held on this subject are likely to be considerably modified. No one speaks with greater authority on the practical side of dairying than Mr. McConnell, and his observations, therefore, are entitled to serious consideration. In the course of a letter to our esteemed contemporary, Mr. McConnell says:—

It may be assumed that all cows get fodder and roots as the bulk of their food—the fodder being hay and oat straw, and the roots being cabbage, turnips, swedes, kohl-rabi, and mangles; some or other of these according to the district and the nature of the farm. The problem is to find out what is the lowest amount of purchased, in feeding stuff that can be utilised to yield the greatest profit from the milk produced. It may be further assumed, of course, that the more concentrated food allowed, the less fodder and roots will be needed to keep a cow going, and therefore some manipulation of the quantities of each may be necessary to find out the happy medium.

The method to be adopted is to first find out the number of pounds daily of each item in the rations fed to the average cow in a herd in milk then value these at the market prices current in the locality; againtt this put the average daily milk yield per head, and thus arrive at the cost for food alone of producing a gallon of milk.

I give a ration below, taken from actual practice, to illustrate the method :—

	d.
10lb, hay	2.6
7lb. oat straw (chaffed)	1.6
28lb. mangles (pulped)	1.5
2lb. decorticated cotton cake..	1.7
2lb. sugar feed	1.1
	8.5

On this the average milk yield is 20.1 lb, or 1.96 gallons; the cost for food is therefore 4.3d. per gallon. Now, the question is, would it pay to increase any one of the above ingredients: the purchased food in the above amounts to 1s. 8d. per week; would it pay to increase this ? My own opinion is that it would not, as I showed in my former letter that reducing from 4s, 6d. per week to 2s. 6d. was followed by an increasing profit balance and a further profit by going still lower, and the point is to find the figure that would give the best results all round—the happy medium, as it were.

Last week, in one of your Scottish contemporaries, two farmers—writing independently—gave their results worked out: with one the cost is 3¼ d. per gallon, and with the other it is 5¼ d. Other things being equal it is manifest that the cheaper man is the one to follow, and it is on this line the inquiry should be made.

The whole world has been started by the milking tests inaugurated by the Highland Society under the management of the late Mr. John Speir. He found that some farmers were feeding their cows at double the expense per gallon of others, and on adjacent farms that some high-yielding herds were not paying so well as poorer-yielding ones not far off, and that there was very great need of investigating this point as one on which we were very ignorant, and in which there was room for valuable inquiry. The last time I met him (at the recent Smithfield Show) he was full of the great advances yet to be made in this direction, but he has not been spared to carry them out.

Since writing the above, the Journal of the B.D.F.A. has come to hand, in which Mr. Speir's last article on the subject appears, and those interested should get a copy. He shows that with cheese-making farms where the milk is produced on summer pastures only, the cost works out at from 1s. to 1s. 8d. per gallon of 10lb. For winter feeding the average was about 4.3d. over 600 cows for two years—that is, the winter cost 3d. per gallon more for food than the summer supply did. He further shows that the cost comes out pretty constant on pastures at both high and low rents, because the higher-rented land yielded the more milk per acre.

Some two or three months ago a friend of the writer reduced his allowance of cake and meal because of evidence similar to the above, and was surprised to find that his herd went up in yield some thirty gallons during the first week; their previous allowance had really been checking the flow of milk.

If any dairy farmer who reads these notes will work out his own figures, and compare them with those that are given above, or with those of his neighbors, he will get his eyes opened, as I have had mine. I am convinced that going back, say forty years, during my father's time and my own, we have thrown away thousands of pounds worth of feeding stuffs, which never left any profit either in milk or manure. The only consolation I have is that I am not the only bally fool in the country.

I have not come across, in recent years, a subject connected with dairying which gives so much promise of immediate cash profit as this, as the result of a little investigation. Finally, let it be clearly understood by half-informed persons that it is food cost only we are discussing, and not the total cost of production. The rent of the land, the cost of labour, depreciation, deaths, & c., are being left out of account for the time being, because this one item is the one we can most easily control, is the one which involves the greatest saving, and is also the one we seem to know the least about, although we have been feeding cows for generations.

Editor's Note.—Will dairymen who have had practical experience along this line send us their opinion on the question of feeding grain etc., to cows on pasture.

Important Appointments.

Some recently announced appointments are indicative of the growth and evolution of the Dominion Department of Agriculture. Messrs J. H. Grisdale, Agriculturist, and W. T. Macoun, Horticulturist, of the Central Experimental Farm have been given charge of the work in their respective branches at all the Dominion Experimental Farms. It is hoped that by having officers whose supervisory work in gardening, field husbandry and live stock will cover the whole system of Experimental Farms a greater degree of unity, efficiency and usefulness will be attained and the national value of the work increased.

The distribution of agricultural information in the form of bulletins and reports has become so important a phase of the work of the Department of Agriculture, that it has been decided to create a new branch having charge of publications in a systematic way. Mr. T. K. Doherty, for some years the capable private secretary to the Minister of Agriculture, is to be chief officer of the new branch with James B. Spencer, at present assistent in the Live-Stock branch as chief editor of publications. Mr. Spencer's extended experience in agricultural journalism fits him admirably for such a position.

The new branch will edit and distribute the information supplied by the Seed, Cold Storage, Live Stock, Agricultural Statistics, Markets and Pedigree Records Divisions and will also have charge of the work involved in the co-operation of the Dominion with the rest of the civilized world in the International Institute of Agriculture, which has its headquarters in Rome.

The transfer of Mr. Spencer to this new work and the resignation of Mr. Geo. H. Greig, Live Stock Commissioner for the West, have deprived Dr. Rutherford, Veterinary Director General and Live Stock Commissioner, of his chief assistants at a time, when the work of his branch of the service is rapidly growing. To make good this loss Prof. H. S. Arkell of Macdonald College has been appointed to the staff of the Live Stock Branch. His position has not been clearly defined to us, but we understand he is to have charge of the organization of the activities of the Department in the encouragement, extension and regulation of the live stock industry.

This appointment appears to us a particularly happy one. Prof. Arkell's thorough education including an Arts Course in McMaster University as well as an Agricultural Course at Guelph, his experience on the staffs of the Ohio State University, the Ontario Agricultural College and Macdonald College and his well-used opportunities of observing the methods of breeders in the British Isles, Holland and other of the older lands have given him a wealth of knowledge, and a breadth of outlook, which admirably fit him for such position as that to which he has been called.

Prof. Arkell's appointment to the Civil Service of course necessitated his resignation of the Chair of Animal Husbandry in Macdonald College Mr. H. Barton, Lecturer in Animal Husbandry, who has been Prof. Arkell's capable assistant ever since the opening of the College, has been granted a well-deserved promotion and is now Head of the Department of Animal Husbandry in the College.

The Corps and Live Stock of Canada.

The Census and Statistics Office today reports on the condition of field crops and the number and condition of farm animals of the Dominion at June 30. For the three years 1908-1910 the field crops range in condition from 82.16 for spring wheat to 91.42 for hay and clover this year to 80 for spring wheat and 82 for rye and peas in 1908. Fall wheat is 85.47 this year compared with 77.28 in 1909 and 89 in 1908. Oats was 90 in 1908 and 93.81 in 1909, and this year it is 86.29. Peas is 86.94 this year; last year it was 84.40 and in the previous year 82. The condition of mixed grains is nearly the same, being 84.53 this year, 86.58 last year and 84 in 1908. Hay and clover is better this year than in either of the previous years, being 91.42 compared with 76 in 1909 and 87 in 1908. The condition of alfalfa has been recorded this year for the first time, and its average is 88.94. Pasture has a condition of 89.02 this year, compared with 99 in 1908 and 87.74 last year. The conditions of all field crops are good in Ontario, the highest being 94.29 for fall wheat and the lowest 84.79 for spring wheat. Quebec crops range from 74.45 for mixed grains to 102.58 for hay and clover. Peas is 84.42 and its condition is the next above mixed grains. In Prince Edward Island and Nova Scotia all field crops are reported for a condition above 90 except alfalfa, which is 83.33 in the Island. Hay and clover are 104.31 in the Island and 185.79 in Nova Scotia. Wheat, oats, mixed grains and alfalfa are reported in a condition above 90 in New Brunswick, and all other crops between 83 and 89 except alfalfa, which is 97. Hay and clover are reported between 83 and 89 except alfalfa, which is 97. Hay and clover are reported at 109.68. Manitoba, Saskatchewan and Alberta have low averages throughout owing to a light rainfall in June. The general condition of crops in Manitoba is much below the average. Correspondents in nearly every district report no rains—only a few light showers and hot dry winds that absorbed the moisture and withered the crops. The lowest average condition is reported from around Brandon and Morden, and the highest from Marquette where it is placed at a standard. In Saskatchewan the crops do not appear to have suffered from climatic conditions to the same extent as in either Manitoba or Alberta, as there have been many local showers. The reports from Lloydminster, Battleford, Indian Head and Qu'Appelle are very favourable, the condition of wheat being placed at 100 and over. The prevailing condition of crops in that part of Alberta south of townships No. 30 is below the average in consequence of the drouth and hot winds. In the Edmonton district the grains, although suffering to some estent from the same causes, are in much better condition. The best reports come from the Strathcona district, and those from Athabaska Landing and Saddle Lake districts are also particularly favourable. The field crops of British Columbia are all good. The areas of late cereals—buckwheat, flax, corn for husking, beans, potatoes, turnips and other roots, sugar beets and corn for fodder—have increased this year to 2,150,382 acres, which is 279,526 acres more than last year and 247,869 acres more than in 1908. But this increase is altogether in flax, which owing to the high price offered for seed has come into favor with the farmers of the Northwest.

The only farm animals which show a noticeable increase since 1907 are horses, while sheep and swine have declined. The condition of all these animals over the Dominion exceeds 99.—Ottawa, July 12th.

Fencing the Farm.

Good fences very often indicate good farming. During the summer extra help is usually necessary for the weeding and haying. After the showers it would be more profitable to use this help at some other job until the ground dries up again. Fencing and preaaring for the fence is one of them. There are a few particular points to be observed.

1. Stave out the line with stakes about 6 feet long.

2. If there are too many trees

(Continued on page 652.)

HORTICULTURE

Store House for Apples.

In planning a storeroom for keeping apples through warm weather as well as cold weather, provision should be made for placing it as deep in the ground as practicable, and the floor should be concrete. The concrete floor gives the best condition of excess heat downward in the summer time, to keep the storeroom cool, and the conduction of deep ground heat upward in the winter to keep the storeroom from freezing. If no artificial heat is to be provided the ceiling should be of galvanized iron, nailed directly to the joists and the space between tae joists and the floor above filled with sawdust, dry peat or some such non-conductor. The advantage of the galvanized iron for ceiling is that it makes the ceiling absolutely air-tight and so prevent loss of heat in winter and it will not mould and so will protect the joists from decay. If the walls above ground were hollow and the space filled with sawdust or dry peat the storeroom would be cooler in warm weather and less liable to freeze in winter. Windows should be double. For ventilation use a nine-inch galvanized iron flue extending out through the roof from near the bottom of the cellar. Provide two six-inch galvanized iron intakes, built horizontally in the wall on opposite sides, with the ends projecting into the storeroom about six inches. Provide each of these and the out-take flue with dampers to regulate the air movemeot. Both intakes and outtakes should be kept closed except when the air is too damp or too warm in winter.—Rural New Yorker.

How to Prune and Why.

Aside from shaping the trees in the nursery, which is done before the trees are received for planting, pruning should begin at the time the trees are being set in the orchard. No systematic method of pruning can be recommended which will apply with equal success for all varities of apples and for all localities. Varieties differ in shape and in habit. Different soils and climatic condition necessitat different methods in different places. Even under similar conditions and with the same variety one man succeeds with one method, while another succeeds perhaps equally as well by adopting a different plan. There are, however, certain principals which should be borne in mind in determining how to prune.

Pruning as a whole should be regarded as a means of adapting the tree, or its individual branches, to environment or surroudings. In considering the environments, the climatic condition of the region is important. Apple trees should be pruned so as to give the maximum amount of sunlight to every limb. This is necessary to give sufficient sunlight for the proper development and the proper coloring ol the fruit. The head may be formed of five or six leading limbs, which spread out equi-distant from each other as scaffold limbs. This arrangement of the branches affords an open centre to admit sun and air. On hill or ridge land trees should be headed much lower than in the valley. This is to prevent the wind from blowing the tops about and destroying the fruit. Trees that are headed low protect the bodies from sunscald, the fruit is gathered and spraying is done with much less effort.

It is generally best to remove surplus limbs while they are young, rather than to leave them until they are large. The removal of very large limbs should bot be practised where it can be avoided. It exposes parts of the tree to the sun which have been accustomed to semi-shade, and also makes large wounds on the trunk. Diseases may get into these large wounds before they heal over. It should be borne in mind, however, that a limb may serve a very useful purpose for a year or two, and then it may be removed if no longer needed.

In removing limbs it is best to cut them very close, so as to leave no suggestion of a knot. The closer the cut the larger the wound will be, but a large wound made by cutting close will heal quicker than a small wound, which leaves the base of the removed branch.

One must depend upan the cambium of the trunk to grow over the wound where a limb is removed from the trunk. If a short knot is left it will die, and the growing layer of the trunk cannot close over it until the tree increases sufficiently in diameter to grow over the knot.

The most of our pruning is done during March, April and May. One can see better what limbs to remove while the trees have no leaves, though diseased and dead parts should be removed whenever they occur. They can be more readily obsererved when the tree is in leaf. Not that every tree in the orchard will need prunning. Ii a tree needs no pruning, do not cut simply for the sake of pruning. Some trees, however will need attention every y?ar. A will need attention every year. A than much pruning at long intervals. —H. Stabler in Farm and Home.

Remedies for some Common Troublesome Insects.

Cabbage Worm.—This is the green worm which works on cabbage and cauliflower, and which is produced from the eggs of the white butterfly. Use Paris green and arsenate of lead in water during the season as frequently as occasion demands on cabbage. Cauliflower cannot be sprayed after the heads begin to form. Dry hellebore, which is harmless to man, can be used on cauliflower heads if they are eaten by insects. Some growers use Paris green on cabbage as strong as three pounds in fifty gallons of water, since they seem to be resistent to injury. A quart of soft soap, or eight quarts of very strong soapsuds should be used in every fifty gallons to insure the liquid spreading over the leaf. Any liquid which contains Paris green should be kept, constantly stirred during the spraying to prevent the Paris green from settling to the bottom.

Currant Worm.—This greenish caterpillar frequently begins its work on the inside of the currant or gooseberry bush, gnd hence it is sometimes not noticed until it has nearly stripped the bush of its leaves. Keep a sharp lookout for them and upon their first appearance spray or sprinkle bushes with arsenate of lead (one pound in ten gallons of water), or Paris green (one pound in twenty-five pounds of air-slaked lime) used while fruit is small. Afterwards use white hellebore as a dry dust when leaves are wet with dew, or one ounce in one gallon of water sprayed or showered on with small broom.

The Lawn.

A pretty, well-kept lawn is one of the best assets a home can possibly have. It is often likened to the canvas a painter uses. Beautiful pictures may be made if one is careful in arranging the trees and shrubs on it. There is no reason for a poor lawn if it is carefully prepared and good seed is sown.

PREPARATION OF LAND.

The land should be deeply plowed pr spaded unless the subsoil is poor, then harrowed, and a good dressing of thoroughly rotted manure put on and disked or harrowed into the soil. All sticks, stones, etc., that would nterfere with the lawn mower should be removed, and the lawn smoothed and raked so that the land is fine and smooth.

SLOPE.

It is a good plan to have the lawn sloping rather than level. It is more pleasing to the eye and drains better than when flat. No steep slopes should be allowed anywhere if they can be prevented. It is difficult to run a lawn mower over them, and the grass is more apt to dry out.

SEEDING.

After the land has been smoothed and fined so that it is in good condition, the seed may be sown. Kentucky blue grass should be the principal seed in every lawn mixture, because it is a strong, rank growing grass and forms a heavy sod. Red top and white clover are added because they form a quick sod and soon give way to the blue grass. A good mixture consists of 3 bushels of Kentucky blue grass, 5 pounds solid red top, and 3 pounds of white clover per acre. If a very large quantity of seed is to be sown, it is better to mix one's own seed; otherwise, buy some good lawn mixture from a reliable seedsman. The seed should be sown evenly sometime when the wind is not blowing, and then immediately raked into the soil. The land should then be rolled to firm the soil about the seed. It is a good plan to water the lawn and keep it moist until the seed comes up. Great care should be used not to allow anything on the lawn until the grass is up and the the soil firm.

SOD.

Sodding is sometimes practiced, but is much more expensive, and while it secures a lawn a little quicker, is no better than seeded land. If not properly laid, sod often makes a rough, poor lawn. The sides of walks and drives may often be sodded to advantage.

TIME OF SOWING.

Early spring is the best time to sow a lawn as grass makes a better growth during the cool, moist weather of spring than later. July and August are usually too dry.

SEEDING BANKS,

Trouble is often experienced in getting grass to grow on a steep slope This is usually because the heavy rains wash the seed out before it becomes established. This may be prevented by running a heavy board along the top of the slope, to turn the water to some convenient place where a box culvert may carry the water over the edge of the slope until the sod is established. It is also a good plan to sow plenty of seed.

MOWING.

As soon as the grass is high enough it should be kept mowed with the lawn mower, as this makes a thicker, closer stand of grass. The clippings may remain on the ground if not too heavy, and protect the plants from drying out.

FOR SALE.

100,000 Apple trees, 75,000 Pears, Plum, Cherries. Complete assortment of other stock. Guaranteed first grade and TRUE TO NAME. Agente wanted on vacant territory, selling for fall and spring 1911 delivery.

BEWARE OF IMITATIONS SOLD ON THE MERITS OF MINARD'S LINIMENT

Minard's Liniment Co., Limited

SEALED TENDERS addressed to the undersigned, and endorsed "Tenders for supplying Coal for the Dominion Buildings," will be received until 4.00 P. M., on Tuesday, August 16 2910, for the supply of Coal for the Public Buildings throughout the Dominion.

Combined specifications and form of tender can be obtained on application to this office.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Honourable the Minister of Public Works, equal two ten per cent (10 p. c.) of the amount of the tender, which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By Order,
R. C. DESROCHERS,
Asst. Secretary.

Department of Public Works,
Ottawa, July 6, 1910.

Newspapers will not be paid for this advertisement if they insert it without authority from the Department.

THE WORLD LOOKS DARK

To the Dyspeptic. How to Make It Bright.

Father Morriscy, the learned priest-physician, realized that many of the difficulties and troubles of this world are due to indigestion. He believed that to get a proper mental and spiritual attitude, a normal digestive apparatus is very helpful. The good Father therefore gave much study to the important question of the stomach.

His famous prescription, "No. 11," for dyspepsia and indigestion, consists of simple tablets cleverly compounded from the materials in Nature's laboratory. Each tablet will perfectly digest a full meal of 1¾ pounds of food.

Father Morriscy's "No. 11" has brought ease and continued health to thousands of sufferers who had previously tried other remedies in vain. It instantly relieves and in due time restores the stomach to full vigor.

If you suffer at times or regularly from a sick, sour, dyspeptic stomach, try No. 11, and see how quickly you can again enjoy hearty meals, and how bright the world looks once more.

In convenient flat boxes at 50c. each. Get a box from your dealer, or from Father Morriscy Medicine Co., Ltd., Chatham, N.B. 91

Co-Operative Fruit Shippers, Association.

A meeting of the Co-operative Fruit Shippers' Association of the Annaphlis Valley was held at Foresters' Hall, Berwick on July 4th. It was attended by delegates from the ten co-operative fruit packing associations in the Valley. The association at Bear River was nor represented.

At the business meeting at 11 o'clock Mr. A. E. McMahon was chosen vice-president, Mr. J. N. Chute, secretary. Mr. S. B. Chute was afterwards elected general manager.

A public meeting opened at 1.30. Mr. S. C. Parker gave an address on the benefits of co-operation, in which he pointed out the financial advantages already obtained in the way of larger prices for fruit better packed as a result of the adoption of the co-operative system. The system was leading to the growing of better fruit as the example and methods of the more careful, painstaking and successful growers would be followed by others, as the benefit resulting from these methods became more patent.

Mr. F. M. Chute urged the adoption of a uniform system of book-bookeeping. He outlined the system now followed, showing the necessity of a uniform system which would facilitate the work of auditors and under which each lot of apples could be traced by entries, from its receipt at the packing house till placed on the car for shipment.

After an interesting discussion upon the subject a committee consisting of Messrs. John N. Chute, Foster M. Chute and Avard L. Harlow, was named to devise a satisfactory and effective system.

Mr. McMahon spoke briefly in regard to aid required by fruit growers from the government. There was a general feeling that too large a share of the receipts for the sale of our fruit in the English market was absorbed by the commission on the other side. He suggested the appointment by the government of a man who could look after the apples in the foreign market.

Mr. F. M. Chute gave some figures obtained by him during his visit to England in January, 1909, showing where very considerable saving could be effected in the marketing of our apples.

Principal Cumming, of the College of Agriculture, suggested that government aid might better take the form of a grant to the Fruit Shippers' Association to be expended in the payment of the salary of a man employed for the purpose stated.

Mr. McMahon, Mr. S. E. Bancroft, and Mr. John Donaldson were appointed a committee to interview the government upon the matter and also in regard to the appointment of inspectors, whose duty it should be to secure uniformity in grading and packing.

Principal Cumming was called on for an address. After assuring the meeting that he had nothing to say in regard to the specific objects of the association, he intimated that a few words regarding the new ditching machine might be the means of answering some questions that would otherwise have to be answered repeatedly. He was able to give the gratifying assurance that the machine was a success. It was now working in Annapolis County. The charge for digging and grading in readiness for tile was twenty cents per rod. It would cut a ditch to a depth of more than five feet. It had been at work for the farmers of Stewiacke and was going back there from this Valley.—B. R.

Red Rose Tea is so popular because "it's good tea" and because when you buy a package you have the comfortable feeling you're getting an article fully worth every cent you pay for it. 62

Dust Spraying.

Dust spraying, or dusting says Prof. H. A. Surface, was at one time strongly advocated because it could be done more quickly than liquid spraying, and with much less waste of material; but it has been found that to be effective it must be done only when the leaves are damp as after a rain or dew. Moreover, it should be repeated five or six times to be as efficient as one good liquid spraying. Those who have been practising dusting have given it up; and even in Missouri, where it was most extensively advertised and recommended, there have recently been a series of experiments performed, showing that it is not so reliable as liquid spraying and is no longer recommended.

When the stomach fails to perform its functions, the bowels become deranged, the liver and the kidneys gested causing numerous diseases. The stomach and liver must be restored to a healthy condition and Chamberlain's Stomach and Liver Tablets can be depended upon to do it. Easy to take and most effective. Sold by all dealers.

Farmers Do Exceptionally Well

——As Agents for the——

Empire Cream Separators

1st.—Because no selling experience is necessary.

2nd.—Because one farmer understands the other.

3rd.—Because the Empire Cream Separator is the easiest to clean, easiest to turn and easiest to sell.

4th.—Because selling separators can be done at odd times without neglecting farm work.

5th.—Because the makers of Empire Cream Separators stand behind every machine.

6th.—Because there is no fault-finding after machine has been placed.

Write us to-day for further particulars.

DAIRYING.

C. W. McDougall, Dairy Inspector, staff Contributor.

Proper Watering of Milking Cows.

The dairyman should remember that his milk cows need water frequentl y during these hot summer days, just as a man does best if he drinks a few sups of water occasionally, before he gets very thirsty rather than great sluices once or twice a day. A cow requires water often to properly digest the food she eats so it is better to give it to her frequently than in large quantities once or twice a day.

If the pasture is provided with a stream of clear water running through it, or a wind mill and well, the cows will of course take care of the water problem to suit themselves and if you watch them you will see them drinking several times a day. If there is no stream or wind mill, and the well or spring is not in the pasture, try the followng plan of watering them, and watch the milk returns and see if the labor involved is not well paid for:

Take a number of half-barrels and place them at convenient spots in the pasture, sinking them into the ground six or eight inches, under trees if there is such shade. If there are no trees then build on the sunny side of each barrel a lean-to shed to make a shade, high enough to permit the cows to come under and drink. Twice or three times a day, according to the size of your herd, fill a barrel or two with water from your well or spring, place them on a wagon and fill up the pasture barrels. See that the barrels are kept clean, and do not allow the water in any of them to remain long enough to become stagnant.

This makes a little extra work, but if you have no running water in your pasture you will find it better to do this than watering your cows once or twice a day. You will get good returns for the extra work in the increased quantity of milk, and in the contented, placid disposition of your cows. Try it a while and you will note a decided improvement. If possible, it is more important that milk cows have plenty of pure drinking water, and just when they want it, than any other class of stock.

Influences of Feeding Potatoes on test of Milk.

A reasonable test for buttermilk at a creamery is .2 per cent fat. I am unable to say what the average test of buttermilk is in this state but I think it does not vary far from this figure in creameries. In some places cream is churned so exhaustively that buttermilk tests down to .1 per cent and I presume it even goes so high as .3 per cent but an average of .2 per cent fat in buttermilk is a fair figure for creamery work.

I do not think that the feeding of potatoes to cows lessens the cream test. If potatoes are fed in small quantities when cows are on dry feed I think they may have a tendency to increase the flow of milk and this may temporarily reduce the test of milk but it will not be permanent.

The test of cream, however, is a matter which is entirely independent of the milk test, if the milk is skimmed by a cream separator as these machines are so constructed that the richness of the cream can be regulated regardless of the richness of the milk skimmed.

E. H. FARRINGTON.
Wisconsin Dairy School.

Close Skimming and Churning.

Emil Holm, of the Royal Experiment Laboratory, Copenhagen, has a thoughtful article in Maelveri Tidende on the value of the chemical analyses of skimmilk and buttermilk.

After acknowledging the value of using te fat percentage of the dry matter in buttermilk, in determining the closeness of churning, he says: "It is my opinion that the closeness of skimming and churning is not enough by itself, more is needed!

"We all agree that the aim of a creamery should be to work so that the least amount of fat is returned in the skimmilk and the buttermilk for every 1,000 lbs. of whole milk. The amount of butterfat in the skimmed milk is the product of the fat percentage and the amount of milk. It then depends not only on the fact percentage, but on the amount of milk as well.

"When thus two creameries skim equally close, as for instance 0.1, but one takes 18 per cent. and the other only 12 per cent. cream, they return for every 1,000 lbs of whole milk treated respectively 0.82 and 0.88 lbs. of butterfat in the skimmed milk. Hence the necessity of not only knowing the analysis but also the weight of the milk.

"It would, however, be premature to conclude from the above example that the first creamery works more economically than the second—the buttermilk must also be considered. Assuming that the whole milk is equally rich at both creameries and assuming that the yield is 4 per cent. butter, and we may here be allowed to leave out the question of the amount of starter and rinsing water used. We then get 140 lbs. buttermilk at the first creamery but only 80 lbs at the second, so that the probabilities are that after all, the latter creamery works more economically. At least it is indicated by some experiments made some years ago by the writer and two creameries where one-half pound more milk was used for one pound of butter when 15 to 16 per cent. was taken as cream than when only 11 to 12 per cent. was taken.

"Hence, if we are to compare results at several creameries as regard the work done, it should be done by comparing the amount of butterfat returned to the patrons for every 1,000 pounds of whole milk.

The Real Canadian Girl

will never waste her money on imported table salt.

St. John, - - N. B.

They Fear Your Common Sense

You are right to use common sense in buying a cream separator. Common sense says "The greater the skimming force, the faster and cleaner the skimming—The fewer the parts, the more durable and easy to clean." You have reason to feel indignant when agents for common, complicated cream separators, who fear your common sense, try to hide these plain facts by belittling your judgment. These agents cannot hope to sell their common machines if they admit these facts, for they cannot admit them without confessing that

Sharples Dairy Tubular Cream Separators

are the best. Tubulars contain neither disks nor other contraptions, yet produce twice the skimming force, skim faster, skim twice as clean, wear longer and wash several times easier than common separators.

The World's Best. The manufacture of Tubulars is one of Canada's leading industries. Sales easily exceed most, if not all, others combined. Probably replace more common separators than any one maker of such machines sells. Write for Catalog No. 194

Light, simple Dairy Tubular bowl compared to common bowls.

Sharples 30 Yrs

THE SHARPLES SEPARATOR CO.
TORONTO, ONT. WINNIPEG, MAN.

"While we surely agree as to the above theoretical side of the question, it may be more difficult when we come to the practical side which I do not claim to master. It requires exact analysis and fairly correct statements of the amount of new milk, skimmilk and buttermilk.

"As regards the chemical analysis we have now in the 'shaking out method' (Gottlieb-Roese method) a reliable determination of the fat so that if special care is taken, excellent results are obtained.

The author then tells about some tests made in 10 creameries to which he sent blanks, with columns for "name of creamery, speed of separators, temperature of milk, feed of milk per hour, pounds of new milk, pounds of skimmed milk, cream cooled to — degrees, churning commenced at — degrees, churning closed at — degrees, — pounds of buttermilk. (The weight of the skimmed milk was given as the difference between that of the whole milk and the cream and the weight of buttermilk as that of the cream plus starter and rinsing water less the butter yield, the buttermilk samples were taken the day after separated milk samples to make them correspond).

The blank had furthermore columns per cent. fat in buttermilk, per cent for three tests of fat in skim milk, dry matter in buttermilk, per cent fat in dry matter of buttermilk, pounds of butterfat in skim milk, pounds of butterfat in buttermilk, total pounds in buttermilk and skim pounds of butterfat lost per 1,000 pounds of whole milk, in skim milk, in buttermilk and in all.

It is hardly worth while to reproduce the table for the ten creameries from Nov. 13 to 16th, 1909, suffice it to state that the total loss of butterfat in skimmilk and buttermilk varied from 1.08 pounds to 1.70 lbs., for every 1,000 pounds of whole milk, or an average of 1,342 pounds.

The table does not show the average per. cent of fat in the whole milk, but if we assume it to be 3.8 per cent. the average loss of fat on the 38 pounds (per 1,000 pounds of whole milk) was 3.53 per cent. (from 2.84 per cent, to 4.47 per cent.)

This article should be read and digested by all buyers of separators who are often flim-flammed by agents with a test of the skim milk without reference to the amount of cream taken.—New York Produce Review.

How Milk is Produced.

"Most persons think that giving down or holding up the milk by the cow is a voluntary act," says John Burroughs, the well-known naturalist. "In fact, they fancy that the udder is a vessel filled with milk, and that the cow releases or withholds it just as she chooses. But the udder is a manufactory; it is filled with blood from which the milk is manufactured while you milk. This process is controlled by the cow's nervous system; when she is excited, or in any way disturbed, as by a stranger, or by taking away her calf, or by any other cause, the process is arrested, and the milk will not flow. The nervous energy goes elsewhere. The whole process is as involuntary as is digestion in man, and is disturbed or arrested in about the same way."

Cost of Raising Calves.

We do not believe that one farmer in a thousand really knows what it costs to raise a heifer calf to one year old. If they do not know they are very likely to sell the animal for less than she has cost them.

The Michigan Experiment Station made a special study of 57 calves raised to one year old.

The following amount of food was consumed per calf:

	pounds
Whole milk	405.4
Skimmilk	3967.7
Silage	1056.8
Hay	1007.0
Roots	148.6
Green feed	148.2
Beet pulp	111.4
Grain	1033.1

The food cost per calf of the above ration was $27.59 per head. Possibly some farmers may raise calves cheaper than the above, but remember that there is no labor cost charged here.

Now the real economic lesson to be learned from this is to raise nothing but what it will pay to raise. Put good dairy blood into your calves. Don't raise cheap, scrub stock for you cannot possibly sell them for what they cost to raise.

The difference in price between a good one-year-old grade heifer, sired by a pure bred bull, and a common native is fully $15.

So it pays to keep a registered sire to bred such calves from.

In the foregoing problem it should be considered that the prices charged for the food, will leave the farmer a good profit in producint it. The calf is to be considered the final market.

The Common Fly in the Dairy,

The common fly is an unmitigated nuisance. It can be said of many insects, that, unpleasant as they may be in many respects, they serve some useful purpose; for instance, a naturalist has recently raised a protest against the wholesale destruction of wasps, and has based his plea on the assumption that they destroy a large number of smaller insects, and especially of aphis. In a garden he had observed how a number of wasps checked an attack of aphis on fruit trees, and he suggests that the preservation of wasps in Kent would probably be attended with good results. But who has a favourable word for the fly? It breeds in manure and decaying matter, and its habits are far from clean. Its presence in large numbers may be taken to indicate that there is an accumulation of some sort of dirt in the proximity It will crawl over a mass of filth and then walk over a dish of food or take a stroll over a bald head, leaving behind traces of contamination. In this way disease is spread, and the bacillus of typhoid has been found in the dirt carried by flies.

As an instance of the numbers of bacteria the common fly can carry, the following figures given by Professor Easton may be cited :—

He caught 100 flies in a kitchen, put them in a pint of sterilised water and rinsed them about, and then examined the water, and found that he has raised such a number of bacteria off that each fly averaged over 300,000. He next caught a similar number in the cow barn, and they averaged over 800,000 each, another 100 in the pig pen, and they averaged over 1,000,000 each, a fourth hundred were caught about the swill-pails, and they ran up to 1,500,000 bacteria apiece. Do you wander that some of us object to seeing flies in the milk-jug? It may be said that when one goes into a factory or a house and finds many flies, one is immediately justified in condemning the sanitary surroundings of such premises. One, too, can appreciate the fact that in factories where flies abound it is next to impossible to keep them out of the milk, and the seeding of the milk by the bacteria which they carry must be very appreciable. The evil deeds of the fly need emphasising as too many of us seem to think the fly a necessary, if annoy,ng, nuisance; but truth is, the fly serves no good purpose or serves a purpose which can be better performed in other ways.

Magnet Cream Separator "Sanitary Strainer"

For STRAINING MILK. Patent No. 123484.

PRICE $1.00 COMPLETE.

Fits the MAGNET Tank or any pail of same size.

All milk strainers have failed to meet the requirements of Dairy Authorities except the cloth strainer, which can be washed clean.

The difficulty of holding the cloth on the top of the pail or tank has prevented the general adoption of the cloth strainer for the cream separator.

The MAGNET Skimming Perfectly sitting on the rough PRAIRIE
THE SQUARE GEAR AND DOUBLE SUPPORTED BOWL DOES IT STEADY AS A ROCK

By a simple spring device (MAGNET PATENT), which circles the top of the tank and holds the cloth in position, this difficulty is overcome and the milk strained directly into the tank.

The advantages are :—

1st, Great convenience in straining the milk.

2nd It retains the animal heat thus enabling more complete separation of butter fat from the milk.

3rd. Prevents dust or foreign matter from falling into the tank.

4th, Nothing to wash except the cloth.

5th. Time and labor saved. Adjust the spring over the cloth, holding it tight around the top of the tank, that is all.

6th. The only "Sanitary" Strainer known.

7th. It is simple, clean and will not wear out.

8th. The same MAGNET quality to the strainer as in the Cream Separator.

9th. Every MAGNET Tank should have one fitted on.

Fill in the coupon with name and address, enclose **one dollar** and strainer will be sent you prepaid. Money refunded if you do not find it the handiest article in your dairy.

Please send a MAGNET "SANITARY STRAINER," charges paid,

Enclosed please find $1.00 stamps of postal order. To ..... P. O ..... Province

The Petrie Manufacturing Co., Limited

Vancouver, Calgary, Winnipeg, Hamilton, Montreal, St. John.

Dairy Notes.

Allow nothing to go half done; neglect in any part of the dairy work is sure to make itself manifest in the quality and price of the product.

Never use a milking tube if it can be possibly be avoided as there is much danger of infecting the entire quarter by the use of the tube.

Oh, yes, a good dairy cow will soon produce her own weight in milk. One Holstein cow in New York state recently gave considerably more than a ton and a half of milk in 30 days.

The most economical dairying can never be practiced without a cream separator. Fat left in skim-milk is too expensive a food for calves and pigs. Butter fat is worth to you just what you can sell ir for in the market, and if you are feeding it by leaving it in the skim-milk, it is almost the same as buying butter on the market and feeding it. No intelligent man would do that.

LIVE STOCK.

Live Stock Pure Bred Sires as an In vestment.

It is evident to a student of Holstein-Friesian official reports that by the use of well bred sires and developed dams, Holstein.Friesian breeders are producing animals of greater capacity as well as acquiring greater skill in the development of that capacity; also that the improvement is but slightly dependent on an increased percentage of fat in the milk, resulting almost entirely from increased milk production. I note that increase in milk is the object of most farmer dairymen in introducing Holstein-Friesian blood into their herds, but sometimes they go at it in a queer and discouraging way.

A man who reads these reports as published in the dairy press writes me about a neighbor of his that is working into Holstein-Friesian cattle by using a fine-looking half-blood bull, nearly half of his calves being black and white, and who intends to use a pure-bred bull as soon as they become a little cheaper. Such a man in his efforts to improve his herd, is doomed to failure, for he has started wrong; and because Holstein-Friesian blood, even in small quantity, is apt to effect color, he will be apt to hold that breed responsible for his ill success. As he does not read dairy papers, he will never stop to think that the progency of a half-blood bull carry but one-fourth the blood he desires, and that the one-fourth cannot offset the preponderating influence of the other three-fourths. He will never learn that the only really good point that his grade bull possesses is the point where the butcher's pole axe should hit him, when he is led to execution.

As such men cannot be reached through the dairy press, Holstein-Friesian breeders should do missionary work when meeting them at the creamery, the condensary or the shipping station. Point out the benefits, and urge them to sunscribe for a good dairy paper; for if you can only get them to reading and thinking, you will find it easy to sell them pure-bred bulls. The question is not so much as to whether they can afford a pure-bred bull as it is as to whether they can afford to do without one, moving along in the old way, and using a scrub or grade. Offer to sell such a man one of the old-fashioned narrow width tools, be it a plow, harrow, drill, mower, rake or any other, and he will quickly tell you that he is not farming for his health, and that he cannot afford to have high priced help on high priced land monkeying time away with such narrow gauged tools. By reading a good dairy paper he will soon apply the same logic to the waste of time resulting from the use of narrow gauge cows.

Suppose that a man pays out $100 for a pure-bred Holstein-Friesian bull and raises but 10 of his heifer calves Suppose that each of these calves on coming imto profit yields but one pound more of milk at each milking than did her dam at the same age, an amount too small to be noticeable without weighing; yet it would amount to 600 lbs for the 600 milkings of the year, and have an average value of not less than $7.50, or $75.00 a year gain for the 10 heifers. But the average milking period for a cow is fully six years. which would bring a total gain to $450.00 for the 10 head. In actual practice, a bull, especially when used by neighbors, begets several times 10 daughters, and the individual gain in production of the daughters over their dams is much greater; so that instead of the $100 outlay being contrasted with $450.00 gain, the gain is more apt to be much over $1,000. What other investment could show such a percentage of profit ?—M. H. Gardner.

Fat Lamb Raising Experiments.

The New South Wales Government Experiment Station has been making extensive experiments, with a view to establishing the best cross for fat lamb raising. The director in charge of the experiments has decided in favor of the Shropshire-Lincoln-Merino cross. The Dorset-Merino and the Leicester have made splendid showings, but the final decision was made in favor of the Shropshire-Lincoln cross. The following table shows the records of the different crosses :

——Breed——	Weeks Age	Av'ge. lbs. Weight
Hampshire Lincoln Merino	10	51
Border Leicester Merino ..	11	50
Border Leicester Lincoln Merino...	11	56
Lincoln Merino	11	52
Dorset Lincoln Merino...	12	65
Shropshire Merino	12	49
Shropshire Lincoln Merino	12	62
Shropshire Border Leicester Merino	21	59
Dorset Leicester Merino	12	60
Dorset Merino	12	57
Suffolk Lincoln Merino .	13	59
Suffolk Merino	13	53
Hampshire Lin., Merino	16	86¾
Border Leicester Merino	17	83

Shropshire Border Leicester Merino	18	95
Dorset Leicester Merino ...	18	97¾
Dorset Merino	18	78¾
Suffolk Merino	19	87
Suffolk Lincoln Merino...	19	90½

Sheep are increasing so rapidly in Queensland, Australia, that the question is raised as to whether the number of sheep in that colony "has not reached the limit of safety," as the correspondent of the Sydney Mail puts it. In 1890 the number reached 18,000,000, but was reduced so 10,340,000, during the next ten years, and in 1902 the flocks numbered only 7,213,000. Since that year the expansion has gone on at the rate of 1,500,000 per annum until close to 17,000,000 were numbered at the end of 1907, and now it is quite probable that the flocks of Queensland are in excess of the number in 1890. The flock masters have retained practically all their ewes since 1901, hence the great addition to the flocks.—Sheep Breeder

Culling the Ewes.

Every farmer who keeps sheep should keep some of the best of his ewe lambs every year to replace the older or poorer ewes in his flock. This is a generally appreciated fact among sheep owners, and is the usual practice upon most farms where sheep are kept. The picking of these lambs, while an important task which calls for good judgment on the part of the flock owner, is not more important than the selection of the ewes which are to be discarded. This is true because of the fact that the lambs selected are likely to be from the deepest milking ewes, since these are the lambs that will make the most rapid growth from birth to weaning time and, having the best start are like to develop most rapidly throughout the season. So in the selection of these lambs the most important consideration is that they are of the right type and uniform in this respect as well as in size and general quality. Most farmers do not pay enough attention to the question of uniformity of type in selecting ewe lambs to keep, basing their judgment of the individual more on size and thrift. These are excellent qualities and should, of course, be present to a marked degree in every animal selected, but uniformity is an equally important factor, even where the sheep are raised for market purposes only. The man who has a uniform bunch of lambs will always get a better price for them for this reason, whether they are sold to feeder or shipper, and it costs no more to produce this kind. But uniformity in the lamb crop can be secured only by selecting the ewes from which they are bred with an eye to uniformity and then breeding them to a pure-bred ram with a prepotency backed up by generations of uniform ancestors.

But the season for selecting these future breeding ewes has not yet arrived and it is the culling of the flock which it is essential to call to the flock owner's attention at this time. If this important work is altogether neglected until the time comes for reducing the flock serious errors are likely to be made which might be avoided by a little attention to the problem at this time. Quite often the condition of the ewes is made the guide for their disposition when the time comes for culling-out the flock. Where this the case it is likely to be the deepest milking ewes which are discarded, especially if the pasture has been short during the midsummer and early fall season. In such cases the ewes which became reduced in flesh through the feeding of one or two lusty lambs have not recuperated and do not look as well as the ewes which did not provide their lambs with as much nourishment, but have laid a good layer of flesh on their backs. Thus the very best ewes in the flock may be sacrificed to make room for those of better appearance, but which do not compare favorably with them from the standpoint of profitable production. But if the owner keeps watch of the flock at this season of the year and marks the ewes which have poor, scrawny

Bad Blood Means Bad Health.

BURDOCK BLOOD BITTERS

Makes Good Blood and Good Blood Means Good Health.

Mrs. Fred Bigge, Kingston, Ont., writes:—"I was completely run down, my blood was out of order, and I used to get so weak I would be compelled to stay in bed for weeks at a time. I could not eat, and was pale and thin everyone thought I was going into Consumption. I tried everything, and different doctors, until a friend advised me to use Burdock Blood Bitters.

"I did not have one bottle used when my appetite began to improve.

"I used six bottles.

"I gained ten pounds in two weeks. When I began to take it I only weighed ninety-three pounds. It just seemed to pull me from the grave as I never expected to be strong again. I will tell every sufferer of your wonderful remedy."

Burdock Blood Bitters is manufactured only by the T. Milburn Co., Limited, Toronto, Ont. See that their signature appears on every bottle.

A Strong, Stay-Tight Connection Where Other Mowers are Weak

Seventy years' experience, plus a disposition to use the very best materials when it might seem more profitable to cheapen things, is why Frost & Wood Implements excel from the "Quality" standpoint.

Take, for instance, the connection between the Cutter Bar and Main Frame of a Mower. Others use Small Pins, that wear quickly, thereby allowing connection to work loose, and eventually "bang" the machine into a blacksmith shop. We use "large" Bearings for our "stay-tight" connection (see illustration). They fit accurately and there is no opportunity for wear, because Cutter Bar has no chance to work loose from Main Frame. No time lost on the field—no bills to foot.

Another example of Frost & Wood "Quality" is the Pitman Connection of Forged Steel and "the Ball and Socket Joint"—strongest, firmest connection on the market.

Roller Bearings, with heavy boxes to maintain them in perfect position, make the No. 8 run easier than others. Every connection is neat and accurate. The "Internal Gear" cuts out the necessity of a "flying start"—knives commence cutting with first forward step of horses.

The No. 8 Mower and its companion, the Tiger Rake, are on the top-most rung of the "Quality" ladder.

PILES CURED at HOME by New Absorption Method

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309, Windsor, Ont.

lambs, in some manner so that they may be easily recognized when the time comes for culling the flock this danger may be minimized. Of course in some instances there may be reasons for this other than the poor milking qualities of the ewes, but this is the season of the year to judge of that point, and there is no question but that the time spent in sizing up the flock in this manner will be well repaid in the future quality of the ewe flock and the market value of future lamb crops bred on the farm.

Of course, there are other factors entering into the selection of the ewes to be discarded. One of the most important of these is age. There is too strong a tendency on the part of flock owners to make the age of the ewe the important consideration in determining whether she should be retained in the flock or discarded in favor of a younger animal. Within certain limits the age of the ewe is an important consideration. The younger ewes will shear better fleeces and will add to the appearance of the flock somewhat and other things being equal, they should of course, be given the preference. But it is a mistake to discard the middle-aged ewe that has given abundant evidence of her value as a producer for one whose powers in this direction are unknown because untried.—**Michigan Farmer.**

Live Stock Dipping Sheep.

Sheep are dipped to rid them of external parasites and the scab mites.

Lime and sulphur dips are injurious to the wool, because of the caustic effect they have. Tobacco and arsenic dips are poisonous, both to sheep and man and must be used with great care. "Coal tar" dips are considered among the best by experienced sheep men, because they are effective, non- poisonous and do not ordinarily injure the wool.

All dips should be tested. Mix one teaspoonful to 50 or 75 of water as per directions. After loosely wrapping a few ticks or bed bugs in a very thin gauze, dip them into the mixture for thirty seconds, then remove and place under a tumbler. If all are dead in six hours, the mixture is strong enough. If not, make the solution stronger until thirty seconds in the dip is effective. In dipping sheep, keep them in the dip for one minute.

To mix, place the dip in the tank first, then add water; otherwise it does not always mix with uniformity.

Dip just after shearing, then little dip is lost. Results are better if dipping is deferred until wool is one-fourth to one-half inch long, as more dip will be held in the fleece. If ticks are present at shearing, the entire flock should be dipped at once before ticks get to the lambs. Repeat the dipping in ten days to kill any excaped or newly hatched insects.

After dipping, remove sheep from the sheds and yards in which they were kept. Then any loose ticks or lice cannot get back yo them.

Digestion Experiments With Stock Food.

A great deal of condimental stock food is sold annually in this country. As a rule this is fed in too small quantities to have any marked value as a food. The manufacturers claim that its chief value is as a tonic, and that by toning up the digestive system better use is made of the other feeds and that consequently the gains are more economical. To test the truth of these seatements, The Iowa Experiment Station carried on a series of digestion experiments with the leading brands of stock foods. The stock food was fed to hogs in addition to their regular rations. It was found that the addition of stock food to the grain ration had no appreciable effect on the digestibility or rate of gain. The gains made when stock food was fed were considerably more expensive, owing to the added cost of the stock food. The details of these experiments are given in Bulletin 113, which may be obtained free by writing to Director C. F. Curtiss, Iowa Experiment Station, Ames, Oowa.

"BUCO" Hand Cultivator.

Handle 4 1-2 Feet Long

The secret of growing things is largely freedom from weeds, and cultivation. No hand too ever made will destroy weeds and loosen soil like the 'Buco," and it does it easily. It's a labor saver and a crop grower. Teeth are oil tempered steel and adjustable to different widths. If you want a nice, clean, healthy garden use a "BUCO."

Sold by hardware trade. If your dealer cannot supply them, write us direct.

$11,000 in Valuable Prizes G

Readers of the Maritime Farm

An Opportunity for Subscribers to The Maritime Farmer.

We have made clubbing arrangements with The Halifax Herald and The Evening Mail, whereby our subscribers can enter this contest and participate in the distribution of the handsomest array of prizes ever given by a newspaper or magazine in the Maritime Provinces. This is an excellent opportunity open to every one living in the territory in which The Herald, The Mail or The Maritime Farmer circulates. Read carefully all about this exceptional offer, and send your name to the Contest Manager at once and get full particulars.

Act at Once.

How To Enter The Contest

Send in your nomination. You will find a nomination blank printed on this page. The nomination blank is good for 1,000 votes, which gives you a fine start.

Then enlist the aid of your friends and neighbors. Use your telephone. Let everyone know that you are a candidate before they promise their help to a more enterprising candidate.

The first thing to do is to enter your name as a candidate, then either call, write or 'phone the Contest Manager, The Herald or The Maritime Farmer, Herald Building, Halifax, for a receipt book with which to secure subscriptions. Then let all your friends know you are in the contest and request them to save their votes for you.

Candidates may nominate themselves or may be nominated by their friends.

All special vote ballots issued on subscriptions are good until the end of the contest, and they may be voted at the discretion of the candidate or subscriber.

Votes are not transferable.

Votes will be allowed on subscriptions secured anywhere in Canada or the United States. But subscriptions must be paid in advance to secure votes.

The votes will be counted and canvassed by a committee of prominent citizens.

In case of a tie the prize will be divided between the contestants tieing.

Any questions which may arise will be settled by the Contest Manager of The Herald and The Maritime Farmer, Herald Building, Halifax, N. S., and decisions will be absolute and final.

Nominations must have address of the candidate.

That's the only way you can afford to keep them, because any lameness means less work and less profit to you.

Spavin, Splint, Curb, Sweeney, Ringbone, Swelling or Lameness need not prevent your horses from working. Simply use Kendall's Spavin Cure.

It works while the horse works—takes away the pain—reduces swellings—makes legs and joints sound and strong—leaves no scars or white hairs because it does not blister.

Kendall's
Spavin Cure

has been the horseman's standby for 40 years and is used all over the world.

Burns, Ont. Sept. 10th 1909.
"I have used Kendall's Spavin Cure and it cures Old Stubborn Cases."
WILLIAM H. DOUD.

Keep your horses sound as a dollar. Get Kendall's today and you will have it tomorrow if needed. $1 a bottle—6 for $5.

When you buy, ask for free copy of our book "A Treatise On The Horse" or write us 51

Dr. B. J. KENDALL CO., Enosburg Falls, Vt.

THE HORSE.

Prayer of the Horse.

To Thee, my Master, I offer my prayer; Feed me and take care of me. Be kind to me. Do not jerk the reins; do not whip me when going up hill.

Never strike, beat or kick me when I fail to understand what you want of me, but give me a chance to understand what you want of me, but give me a chance to understand you. Watch me, and if I refuse to do your bidding, see if there is not something wrong with my harness.

Do not give me too heavy loads; never hitch me where water will drip on me. Keep me well shod. Examine my teeth when I fail to eat; I may have an ulcerated tooth. That, you know, is very painful. I am unable to tell you in words when I am sick; so watch me, and I will try to tell you by signs.

Pet me sometimes; I enjoy it, and I will learn to love you.

Protect me in summer from the hot sun. Keep a blanket on me in winter weather, and never put a frosty bit in my mouth, but hold it in your hands a moment first.

I carry you, pull you, wait patiently for you long hours, day or night. I cannot tell you when I am thirsty; give me clean, cool water often in hot weather.

Finally, when my strength is gone, instead of turning me over to a human brute, to be tortured and starved, take my life in the easiest and quickest way.—Translated from the Sweedish.

Disqualified Stallions.

The presence of one or more of the following named diseases should disqualify a stallion for public service. They are defined as infectious, contagious or transmissible diseases, or unsoundness:

Eye diseases: as cataract, amaurosis (glass eye), periodic ophthalmia (moon blindness).

Respiratory diseases laryngeal hemipleg:a (roaring or whistling,) pulmonary emphysemia (heaves or broken wind.)

Nervous troubles: chorea (St. Vitas' dance), constituting string halt, shivering and crampiness.

Bone diseases; bone spavin ring bone, side bones, navicular disease, bog spavin and curb and abnormal hocks.

Infectious and contagious diseases; glanders or farcey, maladie du coit (equine syphilis), urethral gleet, mange and melanosis (tumors), and any malformations liable to be transmitted to the offspring.

Character of Soil Influences Size Shape and Texture of the Hoofs.

The character of the soil on which they are reared exerts a not inconsiderable influence in moulding the shape of horses' hoofs, as well as upon the texture and quality of the horn. Thus it is found that the feet of young horses bred on low-lying, damp, or marshy and spongy soils grow rather big, and tend to become spreading, often being somewhat low at the heels, while the horn is coarsely textured and comparatively soft or weak. On this kind of land there is also much danger of a young horse's hoofs acquiring a bad shape through overgrowth of the horn, on account of its not been subjected to sufficient wear on such soft pasture-ground. Under these conditions it is necessary to be particularly careful to see to the feet of the young horses periodically, and if they are found to be over-grown, they should be pared down, in order to preserve their normal shape. In the case of young horse-stock which is reared on higher lying and dry soil, the feet tend to remain on the small side, speaking in a comparatipe sense; they are also usually of a slightly more upright shape than in the former case, and the horn is of denser texture, harder and possed of a good deal more toughness. The feet of our mountain and hill pony breeds are generally small, but extraordinarily tough and sound—a result of the dry and hard nature of the soil on their breeding grounds.

Wolf Teeth in Horses.

"Wolf teeth," says the veterinary editor of the Breeders' Gazette, are merely the vestigial remains of the seventh molor teeth (or anterior premolar teeth, more particularly speaking), of the prehistoric horse which existed millions of years ago. Most horses have lost all trace of these teeth which originally were present in both lower and upper jaws; some horses show them in the upper jaws and they are absolutely harmless and have no effect whatever upon the horse's eyes, his health or comfort. In a very few cases they may interfere with the check-bit and when that is so they should be removed; otherwise they should be let alone, and may disappear as the horse matures, Attempting to extract them often ends in breaking off the crowns of the "wolf teeth" and discomfort then is sure to follow the retention of the roots. Thousands of horses suffer with eye disease (periodic ophthalmia, or kindred ailments) and yet prove to have no wolf teeth when examined.

In the same way polled cattle and "muleys" suffer from catarrh, just as do horned cattle suspected of that dire but mythicgl disease "hollow horn" of the superstitious, the ignorant or the wilfully deceptive quack. The horns of all adult cattle are hollow; neither do cattle ever suffer from wolf in the tail." Put all of these things in the category of superstitions founded upon ignorance and nowadays to be relegated to oblivion along with the belief in the signs of the zodiac which have no bearing whatever upon mundane affairs and which long since have changed their course in the heavenly firmament on high.

Regarding "wolf teeth," it may be added that when a colt is first seen to suffer from eye disease and "wolf teeth" are (if present) immediately assigned as the cause by the itinerant wielder of unnecessary dental "tools," the young animal is cutting a number of great molar teeth which extend to the sinuses and cause intense irritation and inflammation of the gums, buccal lining of the mouth and lining of the sinuses and air passages. If the colt happens to have inherited a tendency to eye disease or to any other disease, this is the stage in his life when that disease is most apt to show up. It does show up in such cases and it is the irritation from teething that brings it out. "Wolf teeth" have nothing to do with it. A severe attack of distemper, or influenza, the presence of intestinal worms, starvation, indigestion or any other influence that tends to reduce the vitality of the colt may bring out the eye disease or any other hereditary disease and all irritative causes therefore should, so far as possible, be prevented or soothed by treatment in the management of young growing horses.

Remedy for Colic.

I send herewith the best remedy for all kinds of colic in horses and also good for lung trouble. Fluid extract belladonna 1 ounce, nux vomica 1 ounce, colocynth one ounce, aconite one ounce. Give every half hour for three doses. Dose three-fourths of a teaspoonful. This is the remedy used in the lumber camps of Northern Michigan.—Sunscriber.

The feet need rest from the shoes occasionally, and must have it or the feet will suffer for it.

Teething children have more or less diarrhoea, which can be controlled by giving Chamberlain's Colic, Cholera and Diarrhoea Remedy. All that is necessary is to give the prescribed dose after each operation of the bowels more than natural and then castor oil to cleanse the system. It is safe and sure. Sold by all dealers.

The Full Percentage of Cream

Getting the full percentage of cream from milk depends as much upon the oil used to lubricate the separator as upon the separator itself. Gummy oil will cut the fine bearings of your machine, spoil its balance and waste good cream in the skim-milk pail.

STANDARD
Hand Separator Oil

never gums, never rusts, never corrodes. It feeds freely into the closest bearings and insures the perfect lubrication that is essential to the free spinning of the bowl and the complete separation of cream from milk. It lessens the driving effort and lengthens the life of your separator.

One gallon cans. All dealers. Or write to

A WINDSOR LADY'S APPEAL.

To All Women: I will send free with full instructions, my home treatment which positively cures Leucorrhoea, Ulceration, Displacements, Falling of rhe Womb, Painfull or Irregular Periods, Uterine and Ovarian Tumors or Growths, also Hot Flushes, Nervousness, Melancholy, Pains in the Head, Back or Bowels, Kidney and Bladder troubles, where caused by weakness peculiar to our sex. You can continue treatment at home at a cost of only about 12 cents a week. My book, "Woman's Own Medical Adviser,'. also sent free on request. Write today Address Mrs. M. Summers, Box H309, Windsor, Ont.

POULTRY.

Feather Eating.

Some consider feather eating a disease, others consider it a habit born of idieness, while still others call it a vice the cause of which is a lack of some food element. Perhaps in different cases all are right, for there seems to be a variety of causes leading to the same result. In some cases it is started by the fowls picking at the feathers in an effort to dislodge lice or mites which torment them constantly. Sometimes they do not desist from the practice when the lice and mites are completely eradicted, either because they like the bit of moisture at the base of the feather, or because they have gotten into the habit. Some cases seem to occur from a lack of meat food and the remedy is, of course, meat. To supply this hang up a rabbit carcass, a bit of fat meat or feed ground green bone. Or lacking these, break a dozen fresh eggs in a quart of wheat bran and give the thoroughly stirred mixture as a feed. Another good combination is new milk and bran fed for several days. If it seems to be only a habit dip the fowls in a disagreeable coal tar dip; this will often break it up entirely. Changing to a new location often diverts the attention of the fowls from the habit. Idleness should never be tolerated in any flock and where this is the cause of the habit in a flock the remedy is work. Exercise should be forced upon the chickens in every way possible. No idle fowl is a profitable one, so aside from the cure of this vice exercise must result beneficially. Sometimes thirst from neglected watering fountains leads the fowls to begin feather eating. Not so much, we believe, from a desire to obtain the bit of moisture adhering to the feather, but because the fowl tormented by thirst desires something and not knowning what, developes an abnormal appetite for bits of string, bright glass, feathers, etc.

Fowl on the Farm.

The farmer keeping fowls under the conditions found in the ordinary farm wants fowls that will rustle, will go out into the fields and meadows and pick up a part of their living. He wants a breed that is not in any way an odity. To him large crests and heavily feathered legs and monstrous combs are objectionable, because he does not see that they serve any useful purpose. He feels that such superfluities are out of place on the farm. As on most farms chickens are hatched and reared in the natural way, the farmer's hens must be sitters. The farmer's breed must be suitable for meat as well as eggs, so that the surplus poultry may be disposed of at a profit in the fall.—Plymouth Rock.

To get Rid of Chicken Lice.

To rid small chicks, turkeys and goslings of lice take a tight box large enough to accomodate your flock take paper and pour kerosene oil on paper until it drips. Place this paper in the bottom of the box with the chickens on it. Then place another oiled paper over the chicks so that the box is air tight after you have covered the top of the box with an old carpet. Let this be on there only ten minutes then remove your chicks and you will find them free of lice. Repeat in a few days if necessary. I have used this remedy for years and find it a good one as I have never lost a chick when this was used.

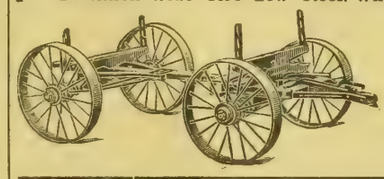
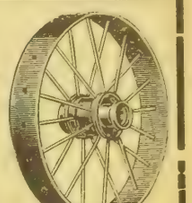
Dominion Wagons and Wheels are for You.

Dominion Wagons—strongest, lightest, easiest draft, most serviceable Converted to platform pattern quickly, easily. Pay for themselves in a year. Best in world for farm uses. Our Dominion does work of two high wagons. Best construction, best appearance.
Dominion Wide Tire Low Steel Wheels—cheaper, stronger, lighter than wood. Best in mud or rocky roads. Cold or jolts can't break them. Reduce repair bills. Save horses. Guaranteed best. Send for **free** catalog—**now.**





Dominion Wrought Iron Wheel Co., Ltd., - - Orillia, Ont.

How to protect Hens from Hawks.

In a great many sections of Eastern Canada hawks do a great deal of harm every year in carrying off fowl and farmers have always experienced more or less difficulty in putting a stop to their ravages. Here is a simple plan originated by an American farmer who tells it as follows:

"For many years we have been troubled with hawks and crows taking our chickens. We have tried traps, poison, guns, and all sorts of scarecrows; but have never quite protected the chicks until this year. This year I selected a half dozen of the longest strips or edgings from a nearby mill, say 12 to 16 feet long. To one end I tied two empty tin cans, punched holes in the bottom of the cans and tied them bottom upward, two on each strip, leaving the strings 12 to 18 inches long. Then I nailed the strips to fence posts, corner of barn or shed, or anything handy. After having them up now for more than a month, not a hawk or crow has been seen on or near the premises; whereas before this there were daily visitations. The cans bump against each other in the wind and glisten in the sun, and the feathered pirates give us a wide berth. It is the cheapest and most effective protection the chickens have ever had."—A. Jeffers.

Suitable Coops Should be Supplied for Young Chicks and Loss from Tranping Prevented.

Everyone who raises many young chicks in the same enclosure or on free range with older ones should have a feeding run. Most small chicks eat with the hen and away from grown ones until weaned, but after weaning time they must take their chances among older fowls and chicks of all ages. The tiny ones are tramped on and often robbed of their share by the greed of the larger ones, the latter getting overfed to the detriment of all. The feeding coops should be made as follows: Take poultry wire that only admits the smaller chicks; this should be covered over the top also. Then make another to admit a still bigger size of young chicks. When you put feed in one for small ones first, then the little ones will all go in there. Next feed the bigger ones and lastly the older fowls or chase them off. It is best to feed small ones first or they will go into the one intended for bigger ones and get as badly tramped as ever. Chicks cannot thrive as they should if all sizes are fed together. The colony plan is always preferable if possible, but where this is impracticable try to do what you can to assist the little ones to get a fair show among the older fowls. If you feed according to size you can also feed diffeeent feeds to chicks of different ages which is an advantage.

Gape Cure

Gapes are the result of parasitic worms in the windpipe. One cure is to dislodge them. This is sometimes accomplished by placing the chicks in a box covered with muslin and dusting fine lime through the cloth The chicks breath the lime, and, as it comes in contact with the worms, these let go of the membranes and are dislodged by the coughing and sneezing caused by the lime. To prevent gapes, keep the chicks on ground where fowls have not previously been. This may be done either by spading old ground deeply, each year, or keeping them outside the poultry yard.

Separating the Sexes.

Most authorities advise one to separate the cockerals from the pullets as soon as they can be distinguished. It is doubtless a good practice to part them when the cockerels are large enough to be troublesome, but with young chicks one must be very careful to keep those of different ages apart. The big ones will be sure to crowd the younger ones. All weak chicks or those that are not thrifty should be put away from the others. It is not always necessary to yard each lot; confine them to their house for a short time, and though they may roam all over during the day they will come home to roost.

THE FARM HOME

This Department is now being edited by a very competent lady, who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

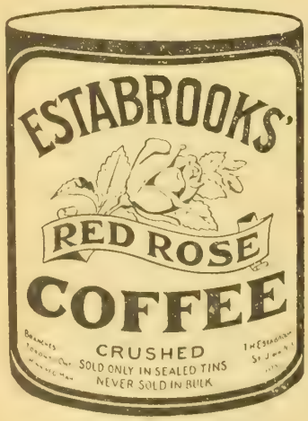
The Lilt of a Laugh.

I've toiled with the men the world has blessed,
As I've toiled with the men who failed;
I've toiled with the men who strove withzest,
And I've toiled with the men who wailed.
And this is the tale my soul would tell
As it drifts o'er the harbor bar:
The sound of a sigh doesn't carry well,
But the lilt of a laugh rings far.

The men who were near the grumbler's side.
O, they heard not a word he said;
The sound of a song rang far and wide,
And they hearkened to that instead
Its tones were sweet as the tales they tell
Of the rise of the Christman star.
The sound of a sigh doesn't carry well,
But the lilt of a laugh rings far.

If you would be heard at all, my lad,
Keep a laugh in your heart and throat;
For those who are deaf to ascents sad
Are alert to the cheerful note.
Keep hold of the cord of laughter's bell,
Keep aloof from the moans that mar;
The sound of a sigh doesn't carry well,
But the lilt of a laugh rings far.

Good coffee means a good breakfast. Nothing takes its place. Nothing tastes so good. Estabrooks' Coffee has the vigorous strength and delicate richness which brightens and satisfies the appetite. Clears the brain. A good starter for the day.



Sold only in 1 and ½ lb. tins.

Try it for breakfast to-morrow

Jacassa's Journal.

(Continued from last Issue.)

"What if you were to fall asleep now, and, on waking, find yourself transported to the other side of the great water?" he asked, smilingly.

"I should think that the dainty Puck, who 'puts a girdle round the earth in forty minutes,' had a hand in the matter," I laughed; "but I fear I should scarcely credit the evidence of my waking senses. I should believe I was in Magic Land."

"'Magic Land!' Ah, that recalls an exquisite poem I read the other day, which haunts me like a dream. Let me repeat it, please, for it conjured up again my own sensations on the morning we anchored in the Bay of Naples." And, slightly leaning forward, with his eyes bent dreamily out on the sea, he repeated, in a low, deep-toned voice:—

"By woodland belt, by ocean bar,
The full south breeze our forheads fann'd,
And, under many a yellow star,
We dropped into the Magic Land.

There every sound and every sight
Mean more than sight and sound elsewhere!
Each twilight star a twofold light;
Each rose a double redness there.

By ocean bar, by woodland belt,
Our silent course a siren led,
Till dark in dawn began to melt
Through the wild wizard work o'erhead.

A murmur from the violet vales!
A glory in the goblin dell!
There Beauty all her breast unveils,
And Music pours out all her shell.

We watched toward the land of dreams
The fair moon draw the murmuring main;
A single thread of silver beams
Was made the monster's rippling chain.

We heard, far off, the siren's song;
We caught the gleam of seamaid's hair;
The glimmering isles and rocks among
We moved through sparkling, purple air.

Then morning rose, and smote from far
Her elfin harps o'er land and sea;
And woodland belt and ocean bar
To one sweet note sigh'd—Italy!'

"What think you of the poem?" he asked after a little silence, broken only by the rippling breakers.

"It is more than beautiful!" I answered, with a long, deep inspiration, for I had sat with hushed breath—"it is exquisite! How like Tennyson—

And, under many a yellow star,
We dropped into the Magic Land.

Oh, I envy you, Mr. Meredith, your sojourn there!"

He smiled. "You have an enthusiastic nature," he said. "You should visit Italy! you may, some day, stand under its serene skies and wander through its grape-purpled valleys but, do you know that, since we have been sitting here in the twilight, I have thought of a land which would possess for you a far more appreciated and native air than the clime of Italy! You cannot guess what land I mean, Miss 'Cassy?"

"Indeed I cannot, unless you mean —Heaven!" I replied, looking up and smiling in quiet wonder. "I hope you don't want to send me there yet awhile, Mr. Meredith, for I shall be very content If I reach it by and by "No not Heaven yet awhile, 'Cassy"—and it thrilled me as he laid his hand on mine; "at least, not that upper abode you mean, though I hope we may both be so unspeakably happy as to reach there some time, together; but there is a lower heaven—a 'Magic Land more fair than Italy, which your feet should walk in here—I mean the magic Land of Home! And, 'Cassy—so lonely, so beloved—will you not give me consent to guide and dwell with you there?" And in an instant I was drawn to his throbbing heart.

Who would have believed it, that he could have so concealed his feelings all that time? for he told me afterward, that he had loved me from the first. I scarcely could. I asked him, after I had grown calmer from my passion of tears that Kate Harlow would say; but he replied that she would love me like a sister —he had long been like a brother to her. And then, while he turned his horse's head homeward, he planned everything in his own way, and I was not "strong-minded" enough to resist. He says we must be married soon, before he leaves Ryefield; that my pen and papers must be locked up, and I must devote one year of my life to learning to love him as well as I "doted' on Montague Livingstone Wentworth.

I heard him passively, like one in a dream; I wonder if I am dreaming, now, this August morning, as I sit and write! But, no! I hear his foot on the stairs—his voice' "Come down 'Cassy! At that pen again, I'll warrant! I'll levy an 'attachment,' and place it under arrest for safe keeping Hurry, please! Here's Aunt Sarah wanting to consult you about certain loaves of cake for a certain occasion!-'

Later.

"The Lor'!" exclaimed good Mrs. Hull, taking me into her arms as I descended to the sitting-room. "To think 'Lisha's been and told me—and if I'd a planned it all, it couldn't a come more to mind! How dreadful pleased Amos 'll be! 'Twas only yesterday he said how natural like it seemed to have you in the house — jest like one of our own. Dear children! I'm so glad you chose her, 'Lisha! And to think you never knew she wrote; and 'twan't the po'try that done it! But there! go right up stairs, child; it's too bad to keep you a colorin' up so! 'Twasn't about the cake, nor nothin' I wanted to speak to you. For shame, 'Lisha! I've allers heard say that lawyers didn't mind sayin' anything anything as comes into their heads!" And under cover of good Aunt Sarah's advice, I escaped to my room; though Elisha shook his finger at me and bade me not exceed his warrant of "just ten minutes.'"

Elisha. That is not a romatic name—I never should have chosen it for a hero—but there is no other name in the world I like so well now How could I help liking him? But I wonder what he saw to love in me! I will go and ask him; and if he is quite sure he does not like Kate Harlow best, after all? I know what he will tell me, though. There, he is calling! "'Cassy!"

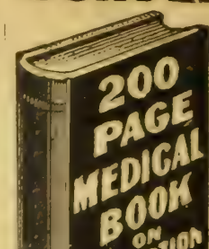
Good-bye, my pen! Elisha says you must have a long rest now. I will hide my journal before I go down, that nobody can ever see or read what I have written here, unless I read it to him some day.

"Come down 'Cassy!" he calls again; "or I shall come up and fetch you!"

"Yes, yes, I'm coming! Dear Elisha I'm coming!"

The End.

Consumption Book FREE



This valuable medical book tells in plain, simple language how Consumption can be cured in your own home. If you know of any one suffering from Consumption, Catarrh, Bronchitis, Asthma or any throat or lung trouble, or are yourself afflicted, this book will help you to a cure. Even if you are in the advanced stage of the disease and feel there is no hope, this book will show you how others have cured themselves after all remedies they had tried failed, and they believed their case hopeless.

Write at once to the Yonkerman Consumption Remedy Co., 1592 Rose Street, Kalamazoo, Mich., and they will send you from their Canadian Depot the book and a generous supply of the New Treatment, absolutely free, for they want every sufferer to have this wonderful cure before it is too late. Don't wait — write today. It may mean the saving of your life.

Annt Tabitha's Fireside.

"Who on airth is comin' up the lane? Do run to the winder, Paul, and see ef you can find out, while I slip on my best cap. Lizzie, where is it?"

"Which one do you mean, Aunt Tabitha?"

"Why, the one you trimmed with laylock-colored ribbin, last week. That's the one. Now, help me about putting it on. Massy on me, if I ain't all of a flutter, for 'tis plain to see that it must be somebody that's purty grand, to ride in a coach with sich a power of gold-leaf put on crinkle-crankle all round the edges. And then there's the two black horses, that look as much alike as two peas, and shine and glisten equal to Major Creasy's best calf-skin butes, that he wears grand muster days, arter he has made his boy Zeke rub and polish 'em with Day & Martin's blackin'."

"Why, aunt, that's one of the railroad coaches," said Paul.

"Du tell! Well, I do declare, ef it don't look smart enough for the President that the free and enlightened citizens have placed at the helum of thie great country, as young Skgire Hitchens said in his Fourth af July oration. I've seen the time when I shouldn't thought it a hardship to walk the matter of half a dozen miles to get sight of sich a grand lookin' coach as that. The land, how this cap bothers me! I've git it all one side. Lizzie do put it straight for me once more, and I'll try to keep it so. There, Paul, the coach has stopped, and the folks in it are getting out. Ef you'll jest go and wait on 'em in, I shall be one of the most thankfulest critters that ever breathed the breath of life.'

"I'll do it with the greatest pleasure, aunt; so all you've got to do is to get your cap straight."

"Stop, Paul, and I'll go with you Whether my cap's straight or crooked is all one to me, for ef that ain't brother Dawkins and his wife, that moved up into the Ohio country eight or ten year ago, I'll never guess ag'in.

"You are right, aunt," said Lizzie. "I remember how they looked, for

Was Troubled With His Liver For Four Years.

Doctors Gave Him Up.

MILBURN'S LAXA-LIVER PILLS
CURED HIM

Mr. Harry Graves, Junkins, Alta., writes:—"I can not say enough in regard to your wonderful Milburn's Laxa-Liver Pills. For four years I was troubled with my Liver, and at times it would get so bad I could not move around. At last the doctors gave me up saying it was impossible for me to get cured.

My father got me four vials of your Milburn's Laxa-Liver Pills, but I told him there was no use trying them and that it was only a waste of money, however I took them and to-day, six months later, I am a well man and weigh twenty-four pounds more than I did. I would advise all Liver sufferers to use them."

Milburn's Laxa-Liver Pills are 25 cents a vial, or 5 vials for $1.00, at all dealers, or will be mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

all I was such a little girl when they moved away."

"Why. Darcus Dawkins, how do you du? I was thinkin' no longer ago than yesterday, that 'twas more'n like as not I should never set eyes on you ag'in as long as I lived, nor brother Jacob nyther. Well, you both look as nateral as life—haven't altered a single artom, as I can see. Come, Jacob, take off your woosted comforter; it's a beauty. Did Darcus knit it for ye?

"Yes. I told her there was no need of my havin' one—thought 'twas no use for me to bundle up in that way; but she wouldn't here a word to me, and so, arter she'd knit it, I thought 'twas as well to wear it.'

"Sartain it was; and now take off yer great coet, while I help Darcus off with her hood and cloak, and the rest of her things. Paul, give the fire a stir, and throw on a few more sticks of that dry maple, for I should think yer uncle and aunt would be chilled through, ridin' this cold day. Come, Darcus, and set in this 'ere rockin'-cheer, and, Paul, hand your uncle the mate to it. Now Darcus, the fust thing you do must be to tell Lizzie and me hoe yer darter Nabby is,"

"Oh, she's the same old sixpence, as the sayin' is, that she al'ays was.

"Smart to work as ever, I s'pose,"

"I guess you'd think so, ef you could see the work she turns off in a day. She could al'ays do as much as any two hired gals I could get, when she lived at home; and now she's got a family of her own, she don't let any grass grow under her feet, I can tell ye,"

"Du tell ef Nabby is married?"

"Yes, indeed. Didn't you never here of it?"

"No never heard a single liso about it. How long is it sence she was married?"

"Well, the knot was tied Thanksgivin' Day, but whether 'tis five or six year ago I can't for the life of me remember. Which is it, Jacob?"

"Well, I should say 'twas five year and six months sence."

"What do you know by?"

"The age of my best pair of team horses, to be sure."

"La, yes, I might 'ave thought."

"Who did my cousin marry?" inquired Lizzi?.

"His name is Smalley. You remember old Deacon Smalley, Tabitha that used to live next neighbor to Daniel Pilsbury, don't you?"

"Yes, I guess I do. He was a purty good kind of a man, and well to do in the world."

"Well, Nabby's husband is Deacon Smalley's oldest son."

"Du tell!"

"'Tis sartain so, and his name is David. The Deacon had three more boys, you know—John, Sam, and Job—and they've turned out well, all but Job, and he's a well-meanin' soul as ever wore shoe-leather, but he's terrible shiftless."

"And David—has he got together a purty good interest?"

"I guess he has. There ain't many cicher men in Ohio than David Smalley is."

"And what kind of a weddin' had you?"

"Fust rate. Everybody fur and near was invited, and they wa'n't very back'ard in acceptin' the invertation. They all stayed to supper, and ef there'd ben twice as many there wouldn't 'ave been any lack of the where-with-all to treat 'em with. You know what a good pervider Jacob always was, and he's just as free hearted now as he used to be. There were turkeys and chickens roast and b'iled, pies, puddings, and tarts, and all kinds of preserves, to say nothin' of the great loves of riz bread, the soda-biscuit, and sweet cake of all kind, from the best of pound-cake down to merlasses ginger bread; and then, to crown the whole, there were two great loaves of weddin'-cake. Sary Bright called it bridle-cake, but what it had to do with bridles is more'n I can tell, but I wouldn't show my ignorance by askin'. As I was sayin', there was two great loaves of weddin'-cake, jest as good and rich as they could be made and all frosted over, so that they looved as white as snow-drifts; and then, peerched right on top of each of 'em, was two birds; I thought then, and I think so still, that they looked like hawks, but Sary Bright said they were meant for doves."

"Well, I should liked to have ben there, that's sartain. What was Nabby dressed in—white satting?"

FREE SAMPLE CULVERT To FARMERS

Say you are interested, and we will gladly send you **Free** and postpaid a sample of the only **Practical** culvert and a handsomely illustrated book telling all about it. For drainage, road-repair, and a score of farm-uses there is no culvert so economical as this. Made of heavy **Billet Iron**; curved cold into half-sections. Then deeply corrugated---makes it five times stronger than smooth-surfaced pipe. Heavily galvanized with lead and zinc to make it proof against rust, dampness, decay, corrosion. Will outlast any other material.

LEARN ALL ABOUT THE MOST PRACTICAL and DURABLE CULVERT

PEDLAR NESTABLE GALVANIZED CULVERT

These pictures show how easily and quickly you can lay **Pedlar** Culvert. Comes nested, half-section within half-section---saving freight and cartage. Triple-thick **Flat** flange locking ribs on each side are clamped together by a simple tool---no bolts nor rivets needed. Joints are broken---only culvert you can do that with. Ends interlap. Will stand tremendous strains. Won't leak, nor buckle, nor crack from frost. **Cheaper than wooden culverts**

An Investment—Not An Expense

Investigate first. Send for the free sample and book. Then recommend this culvert to your township officials---push the Good Roads Movement---this culvert keeps roads in better shape. Use it, too, for any drainage about your farm---there's a size for every purpose. Railways use and approve it---and you know what careful buyers railways are! Investigate.

Rust-Proof
Won't Decay
Easily Laid

"No That's what she thought of havin' at first, but the mantlemaker said there was a kind of French stuff called tarlantane, that was a great deal more fash'nable and stylish than white sattin, so she concluded to have hers made of it,"

"And how was David dressed?"

"All in superfine broadcloth, from top to toe. There wasn't an inch of hum'spun in his whole suit, not even the linin' of his waistcoat; and in that I thought he was a leetle mite extravergant, for I had a piece of bleached linnin in the house—every thread of it was spun and wove by to line his waistcoat and coat-sleeves my own hands—that would 'ave done too."

"They're talkin' about Nabby's husband," said Mr. Dawkins to Paul who caught a few words of what they were saying, "which makes me think of Deacon Smalley, his father and a leetle something that happened when I was a youngster about your age."

"What was it?" said Paul. "I should like to know."

"Well I guess I'll let your aunt Tabitha tell you. She was there, as I very well remember, and can recollect partic'lars enough sight better'n I can."

"What's that you think I can remember so much better'n you?" asked Aunt Tabitha.

"I mean that little affair that happened over twenty year ago, the day the schulemaster delivered an address on edication."

Continued in Next Issue.)

Annette Kellerman on Learning To Swim.

If you have to learn to swim alone, choose if possible a place where the water is shallow, but not too shallow; say up to your chest. This, that you may be able to swim without your feet touching bottom. yet have the feeling of security that an assured footing gives one. If you can find an assistant get used at once to deep water.

In learning alone in shallow water allow yourself to drop slowly from a standing to a swimming position and try to lie comfortably with feet a little below the surface and mouth submerged. The water line should come between the mouth and the nose. The muscles should be relaxed and no part of the body rigid or strained. There is no need to crane the neck in order to keep the mouth above water it only tires without helping, and it destroys the balance of the body. The arms will lift you while they apply their power and you can breathe freely without raising the head at all.

Having assumed the proper position, go slowly through the movements until you feel yourself sinking, then just put down your feet, stand up and try again. But don't hurry. Take only three or four strokes, at first; take only one if you find yourself unable to do more without sinking, but make that one a correct and a deliberate one. You can afterward increase one by one if you can do no better.

Colic and Croup.

Heat, in good quantities, will usually overcome colic. When the child is seized with this, begin by giving him a hot bath, then apply hot water bottles and mustard plasters where the pain is located. Diarrhoea will generally yield to a dose of ginger or peppermint tea, or some other hot drink, coupled with hot compresses, or mustard plasters on the stomach and soles of the feet. In cases of vomiting if the child is lain down and given large quantities of water, as hot as he can tave it, with the trouble should disappear. Croup, a mustard plaster on his stomach, another of the common children's diseases, is not very amenable to home treatment though in sudden cases, it can sometimes be stopped by rapidly diverting the attention of the sufferer to something that interests him.

A Baby's Hot Water Bag and Cover.

My daughter received one of the most useful gifts for her baby. It was a little hot water bag in a dainty flannel case. This cover is made of two pieces of fine flannel, scalloped and button-holed around the edges with heavy blue silk, fastened together by a blue ribbon run through embroidered eyelets. A design of for-get-me-nots is embroidered on one side. It is easily laundered. All she has to do is to take out the ribbon and the two pieces of flannel are washed in no time. This little hot water bag is in continued use, in the baby carriage on cool days, and in her crib on chilly nights

If one wishes to make a gift for a baby she can choose nothing more welcome, I am sure.

Advice to a Country Woman.

Mme. Qui Vine, writing to "Country Womgn'j in the Chicago H?rald says :

Do you want to know why the country woman's dress looks so dowdy on the streets of a big city? Because, as a rule, the country woman overdresses. She has not learned that elegance is plainless, simplicity and soft, dark or subdued colors. On the counters of shops are many worthless and meaningless things—like gilt belt buckles, stickpins, bangled bracelets, chains, fussy neck affairs and general tralalas of dress.

These you must shun, lor they signify neither taste nor necessity. Never buy a white hat. A white hat is a horror, and usually a soiled horror at that. Don't wear silks. Get plain cloth, and have it made up plainly. A plain sailor hat is better than a toppiece trimmed with a cheap and draggly plume.

Strawberry Vinegar.

As strawberries become cheaper and finer in quality be sure to put up a supply of this very delicious vinegar for hot weather drinks. Stem and wash one quart of the berries, drying them well. Put them into a stone jar and pour over them some good French vinegar, allowing one quart to every two pounds of berries. Let stand twenty-four hours, then strain through a jelly bag. Add the second quart of berries and let stand twenty-four hours longer. Again strain and add to the fruit. Repeat the straining and adding to the fruit three times and again strain and add the sugar, allowing a pound of fine cane sugar to every pint of juice. Boil all together for half an hour; then let get cold before bottling and sealing.

Salt as a Dentrifice.

Common salt is an excellent dentrifrice, keeping the teeth white, the gums hard and the breath sweet. Use a weak solution for washing the teeth after every meal.

Eggless Cake.

One cupful of sugar, one-third cupful shortening, three cupfuls flour, obe cupful sReet milk, and three teaspoonfuls of baking powder. Beat thoroughly to make this light and flavor with any extract desired.

10 REASONS

Why You Should Enroll in the

G. T. P. School

OF

Telegraphy

AND

Railroading,

FREDERICTON, N. B.

1.—In six months you can qualify for a position, paying $50.00 a month to start.

2.—The Grand Trunk Pacific and other Canadian Railways have over 10,000 miles of track under construction—80 positions are assured every graduate.

3.—The G. T. P. School of Telegraphy is the only practical and most modern, and the only school in Canada whose course of instruction is endorsed by railroad officials.

4.—Every practical device is here, 20 Stations, Main and Local Wires, Storage and Gravity Batteries, "Train Orders," R. R. and Commereial Messages, over 35 Telegraph Instruments, Resonators, Typewriters, etc. A $2,000 equipment.

5.—You cannot spend six months in any other way that will pay you $50.00 a month to start on.

6.—The Principal of this institution has both the railway and school experience and it will pay you to attend this School.

7.—The Railroads offer greater opportunities to young men for advancement in the Telegraph Field than that of any other profession.

8.—Railway Station Agents receive from $57.00 to $150.00 a month, in addition Free House, Coal, Oil, etc.

9.—We have special lectures Tuesday and Thursday Evenings on the General Railroad Business and duties of employees connected with the duties of operators, station agents, etc.

10.—If you are earning less than $600.00 per year, the G. T. P. School can increase your salary with splendid opportunities for advancement.

OCEAN MILLS, Mount Royal and Lasalle, - Monreal. Que.

The Kitchen Entrance.

A kitchen entrance should be as logical a part of the house as a front entrance. To have a kitchen entrance that juts out from the rest of the building like a loosely attached woodshed shows carelessness in planning. In the country, and the suburbs especially, the back of the house is as important as the front in establishing the right tone to the place. One of the best signs of sincerity in our houses is the growing use of the term "garden side" for the rear of the house.

Strawberry Syrup.

Over three quarts of hulled berries pour sufficient vinegar to just cover, let stand for two days, then drain off all the liquid without pressing. Pour it over a second lot of berries, let stand as before and drain a second time, then measure. For one quart take over half a cupful of water, add to it one tablespoonful of whole cloves and two tablespoonfuls of broken stick cinnamon and simmer gently for fifteen minutes. Strain, pressing hard, add to the measured vinegar and bring to the boiling point. Add two pounds of granulated sugar, boil for ten minutes longer and bottle. A few tablespoonfuls to a tumbler of cold water will make a delightful summer drink.

Fevers.

Children suffer from many complaints which can be helped by prompt action before the doctor arrives. Fever is perhaps the commonest of these. The child should be put to bed when the first signs manifest themselves, and be covered lightly. Nothing in the way of nourishment should be administered, except milk or some like cooling drink, until professional advice can be secured. A cool bath will also prove a help in most instances.

A Fine Washing Fluid.

A most excellent receipe for washing fluid is as follows; one lb. can of potash, one oz. of each salts of tartar, borax and ammonia. Have the druggist to pulverize each and mix salts of tartar, ammonia and borax together. Pour one gallon of rain water on potash and add the other ingredients when cool. Use one teacupful to each boiler of clothes. Soak clothes in warm water first and proceed as in ordinary washing. In cleaning an ordinary porcelain sink and wash basin use common baking soda. Wring out a cloth until quite dry, then put soda on cloth and rub soiled places and any one will be pleased with the result.—Mrs. Lottie Hook.

The Cause of Whooping Cough.

Whooping-cough is regarded by most parents as a necessary evil. Children are expected to suffer from this complaint at one time or another during their years of childhood. It frequently occurs in babyhood; though the attack rarely occurs during the first three or four months of an infant's life. The reason for this apparent phenomenon is probably due to the fact that whooping-cough is brought about by certain conditions, and during the first three months of existence the causes that produce the complaint have not had sufficient time to operate in order to develop it. True, the average physician will tell you that whooping-cough is a contagious disease, it is really made possible by vital depletion, or by the presence of certain poisons in the blood that are continuously seeking an outlet.—Bernarr Macfadden, June Physical Culture.

Salad of Nuts and Green Peas.

A delicious salad may be made by combining green peas and English walnuts in the proportion of two-thirds peas to one-third nuts and mixing with a mayonnaise dressing. Serve on lettuce. If tomatoes are in season, slice small ones and arrange around the salad inside the lettuce.

A woman whom we magazine editors held in profound respect has passed to her reward—Louisa Knapp Curtis, the wife of Mr. Cyrus K. Curtis, publisher of the Ladies' Home Journal. Mrs. Curtis was the editor of that magazine during the first six years of its existence, in which time it attained a circulation of 500,000 copies. Mr. Bok, who succeeded to the editorship, married her daughter. A woman of rare nobility and charm, as wife, mother and editor, Mrs. Curtis is held in reverent memory.

Bathing Towels.

It is well to heat the towels when bathing a baby as an invalid. They dry the skin more quickly and that moist sticky feeling that so often follows a bath is avoided.

The Relationship between Dust and Disease.

"In Outdoor Life, the journal of the Saranac Sanitorium the relationship between dust and disease is graphically described. On the coast of China it is said, is found a seaweed from which the natives prepare a jelly, agar-agar, which serves them as an article of diet. The jelly prepared from agar-agar is transparent and of a pale yellowish green color, very much like our gelatine, but it solidifies into a firmer mass. This substance finds little if any use in this country as an article of diet, but it is used in all, baeteriological laboratories as a medium on which to cultivate bacteria. Wherever a living germ has fallen on the surface of the agar-agar during the few minutes that the cover was removed from the dish on the previous day, a colony of bacteria has grown, and from each germ thousands of descendents have arisen.

"Gotable among the dust borne diseases is tuberculosis. The germ causing this disease is thrown off in enormous number in the sputum of advanced cases, and if such patients

This Man is Young at 55 Years.

He is a "Health Belt Man;" therefore has the vitality and hot, red blood of youth in his veins; he towers like a giant above the ordinary difficulties of life—be a "Health Belt Man" yourself—it gives manly strength; it makes you young and keeps you young all the days of your life; it takes all the coward out of your make up—let me give you of this abundant vitality, then nothing can ever conquer you but death itself—100,000 men have taken my advice, why not you ?

The secret of life-long youth may be summoned up in one word—Vitality. If you have this great natural power in abundance years count for nothing. I use no drugs, I recommend none. Just the Health Belt. No privations, no dieting and no restrictions excepting that all dissipation must cease. Put the Health Belt on nights when you go to bed; let it send its power into your nerves, organs and blood while you are sleeping It gives you a great flow of soft, gentle galvano-vital electricity during the entire night. One application and you are like a new being; it takes all the pain and weakness out of your back; it makes you answer the morning greeting with "I'm feeling fine." It is a great strength builder; it overcomes the results of earlier mistakes and indiscretions; gives you a compelling power, so that you are attractive to all women and men with whom you come in contact. Three months' use is sufficient. S. Coolen, Hubbards Cove, N. S., writes: "I am a man again, thanks to you. Nothing can discourage me now."

This is one among tens of thousands

Free Until Cured. Call or write to me and I will at once arrange to let you have the Belt on trial, not to be paid for until cured. No deposit or advance payment. Send it back if it doesn't do the work. Liberal discount for cash if you prefer to deal that way.

spit carelessly about the house or on the streets the sputum dries, becomes pulverized, and, as dust carrying the germs, may be breathed into the lungs of healthy persons and there set up the disease. In the same way the germs carrying diptheria and a number of other diseases may be distributed and infect humanity. There are, of course, numbers of other sunstances besides agar-agar which are used as food and in which or upon which germs may flourish. The commonest of these is milk. Says Dr. Moss, of the Johns Hopkins Hospital, 'introduce a single typhoid fever germ into a pitcher of milk and allow it to stand over night in a warm place and millions of typhoid germs will develop. A single typhoid germ, if swallowed, would scarcely cause typhoid fever, but drink a glass of milk from a pitcher into which a single typhoid germ gas fallen a few hours previously, and you will almost certainly develop typhoid fever."

How often one has heard concerning a child or an adult who has developed a contagious disease. "I cannot think where or how he or she has caught it!" Perhaps the answer is Dust."

The Art of Reading Aloud.

Elocution and dramatic expression have become a fad. The ability to read aloud history, poetry, descriptive articles, in such a way as to bring out the meaning and give pleasure to the bearer, is not as common as it should be. No accomplishment is more suited to the capacity of young people or better calculated to give pleasure at all times. A good reader can while away many a weary hour for an invalid, or amuse, interest, and keep out of mischief the younger children, or give pleasure to the minds of the sewing society whose fingers are busy or earn an honest shilling or two, for in a city there are many wealthy invalids, or lonely women, who gladly pay to hear a pleasant voice a few hours each day.

The first requisite is a low pitched voice. That of the average English girl is pitched at treble G, while it should be at least as low as G below middle C. Try the voice with an organ, and practice talking in the key of this low G, until it becomes conversation. If you suddenly catch easy and natural. Remember it in your voice in shrill tones, lower them. A low voice, however, does not mean any lack of force or clearness. An organ or piano is made in imitation of the human voice. In both the high notes are thin and shrill, the lower ones increasing in power and richness. An alto voice is generally much sweeter than a soprano. Be careful to form all letters, words, and syllables as near the lips as possible, using the vocal chords in the throat to give depsh, richness, and volume.

Next to a musical voice is correct pronunciation and distinct articulation. Be caseful to give every letter its correct and perfect sound . Perhaps the most common and unnoticed errors are a neglect of final d and a pronunciation of e or i before r like u, as "gurl" for girl, "murcy" for mercy, "furst" for first, "furm" for firm, and so on. Only when the r is double, followed by a vowel, and in her, sir, and a few other common monosyllables, it is sounded like ur. Look up the pronunciation of every word about which you have the least doubt.

Read slowly, take time to breathe tranquilly, try to express the meaning of what you are reading by emphasis, but do not let emphasis spoil the smoothness. In reading prose, try to bring out the rhythm which we strive to avoid in reading poetry. There is not much rhythm in newspaper writing, but all real literature is rhythmical. If you find a book is not interesting, or seems silly, when read aloud, it is not worth reading at all.

Fencing the Farm.

(Continued from page 637.)

grubb them out, especially the small underbrush, clean it away completely.

3. Any stone along the line should be removed to some low place where they can be completely covered or they may be put into the roads which is the proper place for them, rather than along the fence where they harbor weeds.

4. Strike out a ridge along the picket line and plough about 12 feet wide, disc and harrow as if for a crop.

. If any sharp knolls are along the line put on the team and scraper and level. Nothing is so unsightly as a fence following every little hill and hollow.

6. Put down the small pickets from 20 to 30 feet apart. The corner and brace post should be made much firmer as also the gate posts which should be made similar to the corner posts.

7. Use cedar for posts if it is possible to secure them and put the large end in the ground, but first take the bark off and smoothen the knots.

8. Use plain wire with good strong stays for uprights or good strong woven wire makes a good fence. Barbed wire is a thing of the past.

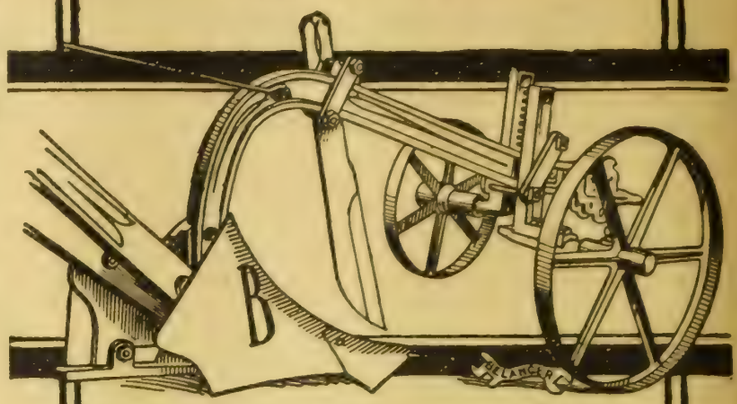
9. Put on the top wire first and grade it perfectly. The bottom wire should be high enough from the ground to allow the grass to be cut with the mowers or scythe.

10. Cut the posts off 3 inches above the top wire and make them round to shed the water. A good coat of paint will improve the appearance of the whole job.

Finally, seed down the whole length of the twelve foot strip (mentioned under 4th point) with a good mixture of permanent grasses. This will keep weeds from growing and will be useful for feeding. If later the whole twelve feet is thought to wide ploughing can be done up to as near the fence as thought advisable.

JOHM FIXTER.

YOU DON'T NEED A SULKY PLOW—GET THIS TRUCK.



THIS truck under the beam makes an ordinary plow as solid as a sulky—takes the strain off the plowman's arms—makes it almost unnecessary to hold the handles—keeps the plow working at an even depth—makes the draught easier and more regular on the horses—makes it possible for a boy to plow as well as a man could. Anyone can put this truck on ANY plow in 5 minutes—you don't need to have one of our celebrated "B" plows to work it. The large 18-inch wheel runs in the furrow, regulating the furrow thickness and width; the small 12-inch wheel supports the plow when the plowing is too deep and the plow has a tendency to overthrow. Remember, $5.00 will put this truck on YOUR plow—isn't that cheaper than a sulky? What's more, that price includes free delivery anywhere in Ontario, Quebec or the Maritime Provinces. Thorough Spraying With "VANCO" Lead Arsenate

will hold in check the Codling Moths, the potato Bugs and all the other leaf-eating insects that take such heavy tolls on your crops.

"VANCO" Lead Arsenate is sure death to the bugs, and it sticks so well that one spraying will retain its effectiveness far longer than if Paris Green were used.

It is easy to spray thoroughly with "VANCO" Lead Arsenate because it does not settle quickly in the spray tank, does not clog the nozzles, and shows so plainly on the foliage that you can tell when you have covered the whole tree or plant.

Price 10c. to 13c. per lb. according to quantity.

"VANCO" Spay Chemicals are High in Quality and Lowest in price. Made in Canada, by practical men, and offered on their record.

Queen Rearing.

Artificial swarm control, artificial divisions for increase and artificial stimulating are now successfully practised but the subject of artificial queen rearing, which should go hand-in-hand with these, is handled rather gingerly or left in the hands of specialists and yet a knowledge of this subject is the basis of success with the others. If we prevent our bees from swarming, where are the young vigorious queens to come from to head next year's colonies. Of what use are artificial divisions if we cannot supply them with properly raised cells, or of what advantage is stimulative feeding if we do not have queens in the hives with vitality enough to respond to the stimulating?

It is very interesting and instructive to trace the development of the methods now largely employed by beekeepers to obtain increased yields of honey and at the same time to keep under control the natural swarming impulse. It may also be instructive to note how these manipulations affect the welfare of the colony in the generations to come.

Probably the simplest manipulation is hiving the swarm on the old stand thus throwing all the field bees in with the new swarm to give an added impetus to honey gathering. This manipulation certainly accomplishes the object sought. It concentrates a tremendous force of field bees for gathering in the crop, and as there is no brood to look after for a few days the honey piles up very rapidly in the supers. But what about the partially developed queen cells in the old colony that has been drawn on so heavily for bees? Does it seem reasonable that they will receive the warmth and attention so necessary to their growth into good, vigorous stock?

Another manipulation generally practised in the control of troublesome after-swarms by breaking down the cells left in the hive after the departure of the prime swarm, leaving only one cell to hatch out. This also accomplishes the object sought. No after-swarm will issue if there is only one queen cell present in the hive but the same objection applies here as in the former case. The few bees in the large chamber will not give any more attention to one cell than they would to six. If the nights are cool, they will cluster in the centre of the hive perhaps away from the queen cell, leaving it unprotected, and the young queen will thus be injured.

Next in order is the practice of universal shaking. By this method colonies are examined every few days and any found making the first preparations for swarming are shaken on to new combs on the old stand and the brood disposed of in various ways. From the standpoint of improvement in the stock this method is the most rational of any since there is no endeavor made to raise queens under unfavorable conditions and the bee-keeper is forced to work out some other method of propagating his stock. We must all face this problem sooner or later and although there are many difficulties awaiting the bee-keeper who proposes to raise his queens artificially, yet after he has mastered the subject I believe that he will consider the time well and profitanly spent. The system of shook swarming lends itself admirably to production of the finest queens and it is the writers wish to sketch briefly such a method, one that can be readily adopted by any careful bee-keeper.

Wait until colonies are being shaken and there is plenty of brood in upper storeys.

There is nothing in the system which we use but what any bee-keeper can adopt. It is a well known system; it has been developed from several different queen breeders. We use the Doolittle plan for grafting cells, and the other apparatus is simply development along lines which will help in the making up of increase and making of nuclei. The first requisite in any operation for making up artificial queens is in getting the colonies in proper shape to raise them. A great mistake made is the starting to raise cells before the colonies are in condition, and starting to make increase before the brood is in condition for making up that increase. I believe it would pay any man to wait until his colonies are in shape before he starts any manipulation with the object of raising queens. We usually wait until the colonies are strong, and until possibly there are a few starting to prepare sealed cups. These colonies are shaken off on to new combs. The brood from these colonies is distributed around the yard to other stocks —possibly two or three combs given to one, and two or three to another, and it is not always given to the weak stocks either. It is given to the medium stocks usually, and these medium stocks are built up until they have brood above, until it is necessary to put on queen excluders; and when they are in this condition I believe the yard is in good condition to start queen rearing.

The first step, of course, after the brood is in shape, is getting the cells started. The cells are grafted by the Doolittle system into prepared cell-cups. They are grafted from the best breeder in the yard, and I do not think it is necessary to go into details of this, as it has been described to often. Before the grafting is done the swarm box is used. A swarm box is simply a box made like a hive to hold three combs, and it has a cover with a slot in it to hold this stick of prepared queen cells. The bees are simply taken and shaken into this box—that is, enough bees to fill the box nicely. A frame of honey and a frame of brood is put in, one on each side. The box is left in that condition for five or six hours until the bees realize their queenlessness and are ready to accept cells. Then this grafting is done, and the grafted stock of cells is put into the box. Usually the shaking is done in the morning, the grafting is done in the afternoon, and the cells are left with the bees until the next morning. By that time those that have been accepted have been fed quite a bit of jelly, and they are then taken and put into the colony that the queen has been taken from and the frame of prepared cells is put above the queen excluder with the queen below. The frame that holds the queen cells is simply an ordinary frame fixed up so that it will fit in. It is put in the centre of the upper story of the cell-building colony. They go ahead and complete those cells and when they are ripe in about ten days' time the cells are put into nuclei. Now, by having so much brood above queen excluders in the yard, the yard is in good shape to make up the nuclei, because the brood is capped over, and there would be none lost by neglect or chilling and by taking one or two frames of this brood that has been entirely capped over in rearing above, and giving it to the nucei, we have the nuclei started. Any shaking after that can be done; and an occasional frame of this brood is put above the queen excluder and given to the nuceli and the young colony is built up in this way.—From an address by F. P. Adams, before Ontario Bee-keepers Association.

SIGNET.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Extension to breakwater, Richibucto Cape, N. B.," will be received at this office until 4.00 P. M., Wednesday, August 17, for the construction of an extension to the breakwater at Richibucto Cape, Kent County, N. B.

Plans, specification and form of contract can be seen and forms of tender obtained at this Department, at the offices of E. T. P. Shewen, Esq., District Engineer, St. John, N. B.; Geoffrey Stead, Esq., District Engineer, Chatham, N. B., and on application to the Postmaster, Richibucto, N. B.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and signed with their actual signatures, stating their occupation and places of residence. In the case of firms, the actual signature, the nature of the occupation and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Honourable the Minister of Public Works, for the sum of two thousand three hundred ($2,300.00) dollars, which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

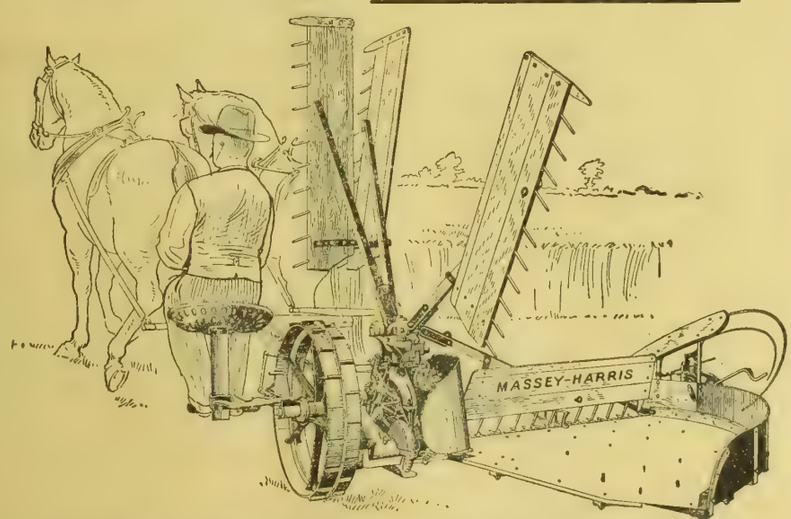
The Department does not bind itself to accept the lowest or any tender.

By Order,
R. C. DESROCHERS,
Asst. Secretary.

Department of Public Work,
Ottawa, July 16, 1910.

Newspapers will not be paid for this advertisement if they insert it without authority from the Department.

Massey-Harris Reaper.



The only Reaper with a steel platform. The large drive wheel gives ample traction. Gears are well protected by shields. Will cut clean without digging into the ground. Pitman has steel strap at knife end and brass bushing at crank end. Driver has perfect control of the Rakes. Platform is easily raised and lowered. Main wheel runs on Roller Bearings. Table is easily tilted by a convenient lever. Machine can be folded for transport easily and quickly.

(Continued from Page 635.)

any man of ordinary intelligence to run it successfully.

(3) That it can be operated summer and winter, and be used for other purposes than ditching, such as a traction engine to pull loads, or to furnish power to saw wood, shred corn, etc.

(4) That when equipped with a gasolin? engine, the operating expense is reduced to a minimum.—N. S. Agr., Report 1909.

More Details Wanted.

A subscriber writes :—I have a young horse that snores in head when hauled hard. Please send me a receipe that will cure or help him.

Ans.—The symptoms are too meager to permit me to diagnose the disease, as frequently there is a loud sound in breathing during an attack of strangles, in cases of catarrh as well as in roaring and in each case the treatment should materially differ. If the owner would give details such as age of animal, duration of condition, whether constant or only when drawing heavy loads, whether worse when stomach is full and if there is any cough. I might give him some assistance.

J. STANDISH, V. S.

Ophthalmia.

R. H. I., Victoria Co., N. B., Ques.—A mare, thirteen years old, is bothered with eyes running water and lids swelling. She sufferes a great deal for three or four days and then her eyes will seem to be all right for a few days. She has been this way for about six weeks and I have used hot milk and Dr. Daliel's Witch Hazel.

Ans.—The disease is Ophthalmia of which there are two kinds; simple ophthalmia , an, inflamation of the mucous membranes of the eye, and periodic ophthalmia, sometimes called moon blindness, an inflammation of most of the structures of the horse's eye ,reovering at varying periods and generally terminating in cataract and blindness.

Treatment.—Most cases are, benefited by a purgative of from six to eight drams of Barbadoes Aloes, two drams of ginger and syrup sufficient to four balls quantity to be governed by size and age of the animal. After physicking ceases, give two dram doses of potassium nitrate, at night in soft food, and easily digested food, such as wheat Bran mash and give one dram of Nux Vomica night and morning. For local treatment bathe the eye twice a day with warm water and afterwards apply a lotion composed of four drams of Sulphate of Zinc, four drams of Fluid extract of Belladonna and one pint of rain water, applying around and over the lids allowing some to run into the eye. There are many other remedies but the above is convenient, cheap and as beneficial as any.

J. STANDISH, V. S.

Ponies.

G. M. B. Newfoundland:—I want to find out the size and height of "Sable Island Ponies!" Government is importing them for breeding purposes, and il they are smaller or lighter in weight than the general Newfoundland pony. I think they are making a mistake. A large number of our ponies go to the Sydney Mines and more would go if they were a little heavier! It's a wonder if there are a large number of "Sable Island:' ponies they are not taken in preference for this work.

Ans.—A Sable Island pony, fourteen hands high weighing seven hundred pounds would be a large one. Few are over that size and the majority are below that, many very much smaller, only twelve hands and about four hundred pounds.

J. STANDISH, V.S.

Feeding Corn Meal in Addition to Pasture Fare.

W. A. M., P. E. I.,:—The article in a recent issue of your paper in regard to increase and decrease of fat in milk was an instructive one. Now I wish to know if a cow, giving milk on grass will fatten by feeding cornmeal.

Ans.—If the cow is in a thrifty condition and has all the succulent grass she can assimilate the tendency would be to for her to lay on fat or increase her yield of milk or both is she were fed corn meal in addition to her regular pasture fare.

Clover Pasture Causes Cattle to Bloat.

My neighbor has a field of common red clover he intended to use for pasture and did a short time to his sorrow, as he lost two valuable animals from bloating. Every time he turns into this field some of his cattle b,oat and he has had to tap some of his cattle to save their lives The queer part of the thing is, that the rest of his neighbors who are pasturing clover are having no trouble. Do you think it is due to the kind of clover or some disease of the clover or is it due to some disease or condition of the cattle?

D.A.T.

If the proper precautions are taken when turning cattle on clover pasture, there is very little danger of their bloating. If hungry animals are turned upon luxuriant clover pasture, especially if it is somewhat moist, there is great danger of the clover causing them to bloat. If the herd is turned in after the dew has disappeared, and permitted to graze in the beginning but an hour or two and then removed to some other field there will be very little danger of any of them bloating. It has been said by some authorities that if cattle running on clover pasture can have access to a straw pile, or an old hay stack, they will eat enough of this to prevent bloating. We have suggested a good many times that cattle running on good pasture, should have access to hay, especially night and morning, and especially is this true when the cattle are first turned to pasture. But one of the safest ways of accustoming cattle to eating red clover is to permit them to graze but a short time at first and gradually increase their grazing period as they become accustomed to the pasture.

Louden's Hay Tools

Have been in use for more than forty years. Each year the demand for them has grown until they are now used from coast to coast, and he best advertisement other makers use for heir goods is that they are

As Good as Loudens

We manage, however, to keep the lead we have always had and to manufacture the best line of Hay Tools ever offered to the Farmer.

This is one of the 13 different Hay Carriers we make.

New Industry Started in the Annapolis Valley.

Mr. F. A. Frazer, of Oregon Washington, United States, arrived in Kentville on Wednesday to install a Lime-Sulphur plant. A site has been purchased about a mile from Kentville on the C. V. Railway. Operations have already began. Mr. Frazer, an expert in the manufacture of this new spray material, has already installed five plants, Nova Scotia being the last to complete the chain of Lime-Salphur factories from the Pacific to the Atlantic Coast. The Nigara Spray Company have secured the services of Mr. Frazer to make next year's output. The plant will cost about $15,000.

Screen Your Doors and Windows

Do not neglect to screen doors and windows with wire in order to keep out flies and mosquitoes and the moths and bugs that fly about at night. This is a necessity, as flies are a menace to health, as well as a destroyer of comfort. If you have no frames for the windows, let the screen cover the whole opening, tacking it on the outside of the frame, then the window can be opened from top or bottom. Do this as soon as the windows are cleaned for the spring.

Soreness of the muscles, whether induced by violent exercise or injury, is quickly relieved by the free application of Chamberlain's Liniment. This liniment is equally valuable for musclar rheumatism and always affords quick relief. Sold by all dealers.

Clean out the Rubish.

Housewives are too prone to harbor up scraps and useless articles that will probably never be of any use, and only serve to cumber and create disorder. The housewife should nerve herself to give, throw away, or consign to a bonfire the rubbish that will never be missed except with a sensation of relief that it is gone.

The PUBLISHER'S DESK.

Manure Value and Manure Spreading.—Few farmers fully realize the amazing dollar-value of manure. Note the figures below. Then think what a profitable by-production manure is. According to carefully conducted scientific experiments, the manure from one animal for a year, has the following values: Horse, $22. to $28; Cow, $28. to $35. So it will be seen how enormous the loss is to farmers who waste the manure—or even a part of it. The best method of taking advantage of the full value of the manure is to haul it out immediately and spread it with a machine. Spreading should be done at once in order to get full value out of the liquid portion, the most valuable part of the manure. The best plan is to keep the spreader in the barnyard, where you can shovel manure into it right from the stable. Then as soon as you have a load, you can haul it out and spread it on the field where it is most valuable. And that is where machine spreading proves its many advantages. A good manure spreader distributes a fine coat of manure over every part of the field—evenly, without waste and to best advantage. You know the objections to hand spreading—the hard work, the time it takes, the wasting of valuable manure by dropping it in piles and the losing of a good part of the value of the manure by letting it lay around in a barnyard corner. Almost any manure spreader is a paying investment. The good manure spreaders pay wonderful dividends. In addition to getting full value out of the actual manure—in addition to saving an enormous amount of work and time—the even spreading insures an even stand so the crop is harvested most easily. Farmers should not overlook that important advantage of the good manure spreader. The proper use of manure, which means spreading it with a good manure spreader—has done more to increase production and decrease the cost of production than any other modern farm implement. But it's the good manure spreader only that counts. The wise farmer does not take chances. He buys the spreader that is doing excellent work for thousands of other progressive farmers throughout the land. He investigates the I. H. C. line for instance because he feels absolutely sure of getting a quality manure spreader when he chooses one of the I. H. C. machines. There's a size and style in the I. H. C. line to meet his requirements. Each style is being depended on by thousands of farmers to maintain the soil's fertility, insuring big crops. Each style is up to the high standard of excellence which marks every I. H. C. product. The materials are of the finest—woods being seasoned and carefully inspected—irons are accurately fitted. So I. H. C. spreaders are strong and durable. They do not bind or break under the hardest strains. They are exceedingly light in draft, due to the wide wheels and roller bearings. The Cloverleaf is of the endless apron type. One leaver controls the entire spreader mechanism—stopping and starting the beater and apron—and changing the feed to spread thick or thin. A vibrating rake levels the load as it comes to the beater, insuring absolutelfy even spreading. The wheels are made of oval steel-staggered spokes and flanged, wide steel tires. The Cloverleaf spreads manure in any condition as well as all other fertilizers. The parts are few—the spreader is simple, strong

Agricultural College, Truro, Nova Scotia.

Next Session of Full Course Begins NOVEMBER 1st, 1909.

Next Short Course for Farmers and Farmers' Sons Begins JANUARY 3rd, 1910.

Next Short Course in Domestic Science, Dairying, Horticulture and Poultry for Ladies Begins JANUARY 4th, 1910.

Three hundred and fifty [350] students enrolled in the various classes during the past session. A large increase is expected next session.

Tuition FREE to all students from the Maritime Provinces

A farmer's son attending the College, can take a full course in the various branches of Agriculture, Horticulture, Dairying, Poultry Raising, Veterinary Science, etc., and at the same time, in English, Mathematics, Book-Keeping, Political Economy, the various Sciences and other lines regularly studied in High Schools and Colleges.

Requirements for entrance are familiarity with farm practice and an ordinary school education. The College is especially adapted to the needs of farmers' sons who have had an opportunity to acquire a school education and now wish to improve their knowledge in all lines.

Students completing the two year course at Truro can enter the third year at Guelph, St. Anne de Belle Vue or any of the American Agricultural Colleges.

For full particulars apply to,—

M. CUMMING, B. A., B. S. A., - Principal Agricultural College, - Truro, N. S.

and durable and its efficiency is of the highest. Then there's the Kemp 20th Century, another I. H. C. spreader of merit. The aprons forms the bottom of the box and is of the return type. The main frame is strong and substantial enough to support all the working parts. The beater is designed so that it thoroughly pulverizes the manure before spreading. There is no cramping, twisting or binding of gears or apron It, too, is adjustable to spread light, medium or heavy—the changes are easily made and the entire spreader is so simple that a boy can run it. The front wheels are lower than the rear wheels and are set closer together. These are provisions to permit the wheels to cut under the box for short turning, to prevent deep rutting of the fields, and also to prevent tongue twisting and jolting. The Kemp 20th Century is furnished with wood or steel wheels as desired. It can be used for spreading any kind of manure or comercial fertilizer. The Corn King is still another I. H. C. spreader of high quality. The gear construction is remarkably simple—the gear teeth are deep, insuring perfect work at all times. It, too, is of the return apron type. It is instantly adjustable to spread any amount manure per acre as desired. The vibrating rake insures even spreading. The whole spreader is remarkably compact and strong. Corn King spreaders are giving satisfaction everywhere. If you are thinking of buying a manure spreader, and every farmer who hasn't one ought to be thinking along those lines—it is a good plan to see the local International dealer about the size and style that meets your requirements. I. H. C, spreaders are made in capacities from 30 to 70 bushels—for large and small operations. If you prefer, write direct to the International Harvester Company of America, Chicago, Ill., U. S. A., for any definite information you want about the spreader you are most interested in.

Of Value to Horsemen.—Do you turn your horses out to pasture. If so, we want to call your attention to a very important matter. Horses which have been used steadily at work, either on the farm or road, have quite likely had some strains whereby lameness or enlargements have been caused. Or perhaps new life is needed to be infused into their legs. Gombault's Caustic Balsam applied as per directions, just as you are turning the horse out, will be of great benefit; and this is the time when it can be used very successfully. One great advantage in using this remedy is that after it is applied it needs no care or attention, but does its work well and at a time when the house is haping a rest. Of course it can be used with equal success while horses are in the stable, but many people in turning their horses out would use Caustic Balsam if they were reminded of it, and this article is given as a reminder.

A Roofing that needs No Painting.—Farmers all over the country are beginning to wake up to the fact that it is no longer necessary to use ready roofings that require constant painting to keep them tight. The new style of ready roofings with a mineral surface, of which Amatite Roofing is the best known, are becoming very popular and have proven a great success.

The mineral surface of Amatite needs no painting or coating whatever, and after the roofing is laid, there is no further excuse for trouble A sample of Amatite can be secured by addressing the nearest office of the CARRITTE PATTERSON, MFG., CO., St. John, N. B., and Halifax, N. S.

Grand Trunk Bureau in London.—A part of the magnificent Headquarter's Building recently built by the Grand Trunk System on Cockspur Street, London, is to be devoted to the Bureau, through which is to be distributed information concerning Canada. The Standard of Empire calls it "A new Canadian Commercial Embassy." Above the main offices of the Grand Trunk are spacious rooms set apart for this work. Here visitors may rest and read the news of the Empire, ask questions and receive expert advice about the Dominion of Canada. Upon the walls of these rooms are splendid pictures showing the progress being made by men who are building the new nation of the north

---

Improvement in Amatite Roofing.—Amatite Roofing, which has for several years been growing rapidly in popularity among our readers on account of its no-paint mineral surface, is now being made with several little improvements designed to make it easier to lay.

One of these is the smooth lap, left along the edge of the roll, about three inches wide,where the mineral surface is omitted. This smooth lap makes a closer and tighter joint possible.

The adhesive cement which is supplied with each roll now comes in liquid form and does not require heating before use.

Instead od supplying the nails and caps, the nails themselves have extra large heads, thus saving considerable bother in putting down the roofing.

Readers who are unfamiliar with Amatite Roofing should send for a sample to the nearest office of the CARRITTE PATERSON MFG, CO., St. John, N. B., and Halifax, N. S.

From "La Patrie" June 21st 1910.

The French Canadians now number two on the Directorate of the Grand Trunk Pacific. Mr. Alfred Brunet, who was named by the Government to represent it at the time was formed, and the Hon. Raoul Dandurand, who was chosen at the last meeting of the Directors. The nomination of Mr. Dandurand is welcomed with much pleasure in railway circles, where his talents and ability will be valuable in the direction of our National Transcontinental Line. We are now represented in the two great Canadian Railways as we already have Hon. Senator Forget on the Directorate of the C.P.R.

Another paragraph says:—

The Directors of the Grand Trunk Pacific have elected the Hon. Senator Dandurand one of their number. As is known, Mr. Alfred Brunet, represents the Government on the Board already. "La Patrie" rejoices sincerely in the nomination of Mr. Dundurand.

The Late Rev. Father Morriscy's Birth Anniversary.—"Halifax, July 16.—To-day is the sixty-ninth anniversary of the birth in this city of William, afterwards Rev. Father Morriscy, lovingly remembered throughout the Maritime Provinces and known across the Continent for his remarkable cures. During his thirty years' pastorate at Bartibogue N. B., his truly wonderful medical skill was at the service of all who needed help, and for his services he steadily refused pay. Thousands came to him or wrote for his advice, and his fame spread far beyond the bonds of his own parish. Since his lamented death, on March 30, 1908, his best known prescriptions (now the property of the Rev. Sisters of the Hotel Dieu) have been made up and placed on sale through the Maritime Provinces and Quebec so that in fuller measure than even during his lifetime, his good work for the sick and suffering goes right on.

MARKETS.

Charlottetown Prices.

Grain.—Oats 38c. to 43c.

Feedstuffs—(Retail)—Bran $1.20 to $1.25; Shorts $1.30 to $1.40; Middlings $1.35 to $1.40; Oil-Cakes $2.25; Corn Meal $1.75 to $1.80.

Live Stock.—Butcher's cattle (fat) 5c. to 6c.; Stockers (grass fed) 4c. to 4½c.; Milch Cows $35.00 to $55.00; Sheep 3½ to 4c.; Lambs $2.75 to $3.50 Young Pigs $6.00 to $8.00 per pair.

Dressed Meats.—Beef (Carcass) 9c. to 12c.; Mutton (Carcass) 8½ to 9½c; Veal (Carcass) 4½ to 6c.; Lamb (Carcass) 12½ to 15c.; Pork none offering.

Horses.—Drafters $100. to $250.; Roadsters $100. to $225; Carriage $150. to 225.

Dairy Products.—Creamery Butter 22c. to 23c. solids, 22½ to 23½c., prints; Dairy Butter solid 17c. to 19c; Cheese 10 13-16 to 10 ⅞c.

Poultry and Poultry Products.—Eggs 15c to 15½c; Fowl 11 to 12c; Chickens 60 to 75c a pair.

Fruit.—Strawberries 3 boxes for 25c.

Vegetables.—(Retail)—Carrots new, 5c., per bunch; Potatoes (wholesale) 40 to 45c; Beets (new) 5c., per bunch retail.

Miscellaneous.—Hay $9.00 to $10.00; Straw $6.00; Wool 23c. cash 25c. Trade; Beef Hides 8c.; Calf Skins 10 to 12c.; Sheep Skins 35 to 50c.; Lamb skins 15 to 25c.

MARKET REVIEW AND FORECASTS.

Haying is now in full swing and farmers are busy, besides there is not much farm produce left in the farmers hands and markets are consequently poorly supplied in hay, oats and potatoes. Strawberries have been quite plentiful and were retailed last week at 4 boxes for 25c., but the supply is now limited and prices are higher and another week or ten days and the crop will be all over. Other fruits will then be coming on to take their place. Crops are growing fine and there is every prospect of heavy yield in all lines. The hay crop is very heavy and so far is being stored in good shape. The hay market is easier and about $9.50 is the limit of price paid by shippers. Oats in sympathy with advance in the West are firmer but there does not seem to be many for sale. Potatoes are also pretty well cleaned up and the market being bare of supplies the price is gradually advancing and 40 to 45c., is being paid for them in a small way, mostly for retail trade. Creamery butter is still firm and meets with fairly ready sale at prices within our quotations. Dairy Butter is dull and there is more offering than the market will take care of and it is being stored for use later in the season. This was cheese board day and the quantity boarded was not as large as expected owing no doubt to the absence of some of the salesmen. The highest price paid was 10⅞ at which price about 200 boxes were sold, about 1000 boxes sold at 10 13-16 balance refused to sell at that but would likely sell afterward. Beef is firm but there will be a lot of grass fed cattle ready shortly and prices are likely to be easier.

Charlottetown, July 22, 1910.

Halifax Prices.

The market on the whole is very interesting just now. Flour has scored almost sensational advances, the situation now being quite extraordinary for this time of year. Oats are much higher, and rolled oats are higher also. Beef has also scored another advance at packing points. Pork is a little easier and lard a half cent lower. Collections are fair and the wholesale trade report that they are not disturbed more than ordinarily by failures in the grocery trade. Everyone anticipates a good summer and fall trade.

BREADSTUFFS AND FEEDS.

Rather startling developments have taken place in the wheat and flour markets—developments that a few weeks ago were hardly expected. The crop damage reports have been instrumental in causing a total advancement in wheat and as it requires about five bushels of wheat to produce a barrel of flour, this is equivalent to an advance of about a dollar a barrel in flour. The mills have not put up their prices so much, but the advance in the past fortnight is almost 50 cents a barrel. The jobbing trade meantime have not put up their prices to such an extent. It will probably be a matter of only a few days though until further advances are made by jobbers to bring prices more into line with mill prices. Jobbers are thus able to give better values just now than could be had at the mills. Advices from the Upper ing in flour. The large millers are Provinces indicate a very strong feelsaid to be looking for further advances if the wheat market continues as firm as it is at present. Most of the Ontario millers of winter patents are closed down, waiting for the new wheat crop. There has been some demand from Europe and a fair amount of export business has been done at good prices.

Oats have advanced several cents during the past fortnight. Reports are to the effect that in some sections of the Dominion the farmers will not have enough oats for their own use. The prices are likely to be higher for a time. This of course involves an advance in rolled oats and oatmeal, which are really lower locally than they can be bought for at first hands today. The millers about a week ago put up the price 20 cents a barrel in sympathy with the advance in the raw material, and it is said that a further advance is in prospect if the price of oats is maintained.

Feeds are firmer in sympathy with wheat and flour, but no material advance has yet been made here in the jobbing prices, though the mills are charging from one to two dollars more per ton on bran and middlings. The development of considerable export business in bran has further contributed to a firm feeling. Ontario bran is very scarce owing to most mills being closed down. Corn having advanced the price of cornmeal is affected and the situation in this commodity is now very bullish. The prospect of a good hay crop is inducing those who have old crop left to bring it forward for disposal.

Flour.—$5.00 to $6.55.

Beans.— $2.05 to 2.20.

Peas.—$4.75 to 5.75.

Oatmeal, Standard, in bbls, $5.05 to $5.15; Oatmeal, Standard, in bags $4.90 to $5.00; Rolled Oats, in bbls, $4.55 to $4.65; Rolled Oats, in bags, $4.35 to $4.45; Middlings, $25. to $26.00; Bran, $21.50 to $22.00; Shorts, $24.00 to $25.00; Feed Flour, bag 98 lbs, $1.70 to $1.75; Cornmeal, in barrels, $3.20 to $3.30; Cornmeal in bags $1.55 to $1.60; Feed Oats, bulk .49 to .50; Feed Oats, in bags, .52 to 53c.; Hay, $12.00 to $14.00.

PROVISIONS.

A surprising thing about the trade in provisions is the fact that in spite of the high price there has been considerable enquiry of late. Beef has advanced again and packers are now charging 50 cents a barrel more. The situation in pork products now seems to be changing somewhat; at least pork is easier than it was a fortnight ago and lard is costing ½ cent a pound less at packing points. There is a fairly active demand just now for hams and bacon. As is pointed out elsewhere, the warm weather, making it difficult for many country people to get fresh meat, has caused an increased demand for smoked meats. The future of pork products depends largely upon the hog supply. There has been some increase in this, but perhaps not enough to make any appreciable difference in barrelled pork. The world's supply of hogs is very much restricted and it will take some time to get it back to normal again.

Pork.—American Clear Fat Backs, $30.50; P. E. I. Mess, $29.00; P. E. I. Short Cut Backs, $29.50; American Bean, $29.00; Rumps, none; Jowls, $15.00; Pigs Feet, $6.50; Hams $18.00 to $19.00; Roll Bacon, .16; Side Bacon, .20; Lard in Pails, 17; Lard in cases, .18c.

Beef.—American, $22.00; Best Canadian, $21.00; ½ Bbls Pork and Beef, 50c extra.

BUTTER, CHEESE AND EGGS.

The jobbing trade in butter locally is very dull at present, as there is an unusually large supply of butter coming in direct to the grocers from nearby points. The unusually good grass conditions are the cause of the plentiful supply. There is a large supply of local creamery coming on the market, but this is being absorbed through the regular channels. The markets generally are steady in tone, the belief being that we will not see much if any lower prices this year. The supply of eggs from nearby points is much less in quantity than at any time for the past few months and shipments from Prince Edward Island are not commencing to find their way to this market.

Creamery Prints, 26c.; Creamery, Solids, 25c.; Dairy, solids, 22c; Dairy rolls, 21c.; Cheese, Twins 12½c.; Cheese, Large 12c., New Laid Eggs, 19 per dozen.

FRESH FRUITS AND VEGETABLES.

The strawberry season now ending, the trade turn their attention to other fruits, such as raspberries, which are now quoted at 12 cents a box and native cherries, which are selling at 15 cents. American apples are now on the market and are offered at $1.80 a basket. Potatoes are again higher and now all varieties of stored potatoes are selling at $1.50 a bag. The tendency is for fresh vegetables especially to become cheaper, and in many lines of fruits more favorable prices are obtainable too.

Potatoes.—Nova Scotia, per bag, $1.50; New Brunswick, per bag $1.50; P. E. Island, per bag, $1.50; Rhubarb native, per lb, .02; Tomatoes per crate, 20 lbs, $2.00; Lettuce, per doz heads, .50; Asparagus, per doz. bunches $3.00; Strawberries, per box, 8c. to 10c; Cucumbers, each .05c; Peaches, per cwt, $1.50; Plums, per cwt., $2.25; Cabbage, per barrel $1.90 to $2.00; Apricots, per cwt. $2.00; New Turnips, per doz, 60c New Beets, per doz 70c; New Carrots per doz, 70c; Native Cherries, 15c. Cauliflower, per doz, $1.00; Raspberries, .12; Apples, per basket, $1.80.

FRESH MEATS AND POULTRY.

The supply and demand just about balance one another in this department. Lamb is a little more plentiful and very good in quality; but as carcasses are larger in size as well as more plentiful in number, the price is dropping some. The beef market is a little easier, though not a great deal. Just now, of course, the demand is for the lighter meats. Poultry is in request to some extent with moderate supplies to draw upon.

Fowls, per lb, 13c; Turkey (fresh killed) per lb 17 to 18c; Lamb, (cold storage) none; Spring Lamb, per lb, 14c; Spring chickens, per pair 70 cents, to $1.00; Geese, none; Ducks, per lb 15 to 17c; Beef, per lb, 9 to 10c, Mutton, per lb 6½ to 7c; Veal, per lb, 6½ to 7; Pork, 10 to 11.

Halifax, N. S., July 19, 1910.

St. John Prices.

The general condition of trade continues to be satisfactory, although of course the Campbellton fire has considerably effected business with the section for which it is so large a distributing centre. Several St. John houses had warehouses in Campbellton, and many wholesale merchants had business relations with the town and surrounding country. Of course the limber industry of the Restigouche is affected by the destruction of so many mills. It is expected that these will be rebuilt. The lumber industry in other parts of the province is active, and shipments are steadily going forward to trans-Atlantic and United States ports.

Except that flour has sharply advanced and lard is easier, there is no change in market quotations.

Flour and Meal.—There has been another notable advance in flour. Hard wheat patents, $6.85 to $6.90; choice patents, $6.10 to $6.15; medium patents, $5.95 to $6; oatmeal, $4.75 to $4.80; cornmeal, $3.

Provisions.—Lard is easier. There is no other change. Domestic mess pork, $29 to $29.50; Lumbermen's XXX, $15.50 to $16; lard, tub base 16½c.; compound, 13½ to 13¾c.

Beans.— The price is steady at $2.20 to $2.30.

Produce.—Cheese is easier at 12c to 12¼c.; butter steady at 17c. to 19c.; and eggs firmer at 17c. to 18c for case stock.

1 Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only one cent a word, you can advertise anything you wish to buy, sell or exchange. The address must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issue. No black faced type or display of any kind will be allowed under this head, thus making a small ad. as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex N. B.

WANTED.—Hides calfskins, sheep and lamb pelts. J. J McLEAN & SONS Hopewell N. S.

SHORTHORN BULLS for sale. WALTER EATON, Upper Canaid, Kings N. S.

GUERNSEYS FOR SALE.—Two yearling Bulls, one six months old Bull and several Bull Calves.—T. D. BLAIKIE, Great Village, N. S.

SHORTHORN BULL 21 months old for sale at a bargain. Write me for price or better come and see him. HAROLD ETTER, Westmorland Point. . B

SALESMEN WANTED for the best automatic compressed-air hand sprayer made; liberal terms; sample machine free to approved agents. —CAVERS BROS., Galt, Ont.

DAIRY AND STOCK FARM FOR SALE.—Three miles from Sussex, 300 acres, 200 acres under cultivation, large intervale cuts 80 tons hay. Good two-story house heated by furnace, water pumped by windmill, good barn.—HARVEY B. PARLEE, Sussex, N. B.

THREAD POWER FOR SALE.—One second hand two-horse Moody thread power for sale cheap. First set of planks still on the machine. Write POWER care of MARITIME FARMER, Sussex, N. B.

ALL kinds of books on Poultry, Pigeons, Rabbits, Pheasants, Horses, Cattle, Farming, Gardening, Bees, Fruits Flowers, Vegetables, etc. Catalogue free.—MORGAN'S POULTRY SUPPLY HOUSE, London, Ont.

Perfection Ideal Band

It is the best band on the market. There are no sharp corners to chafe the fowl. They are cut clean and smooth. The workmanship is the best that there is on any Band made today. 12 for 15, 25 for 20c, 50 for 40c, 100 for 65c. State breed bands are for. Sample and catalogue for stamp. GEO. H. SEAMAN, Moncton, N. B.

Striking Illustrations of the Value of Underdrainage

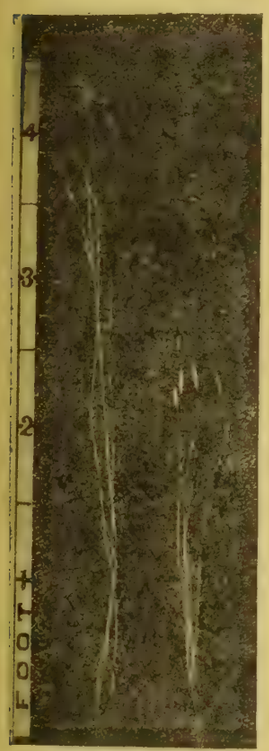

Figure I.
Fall Wheat on Drained and on Undrained Land.

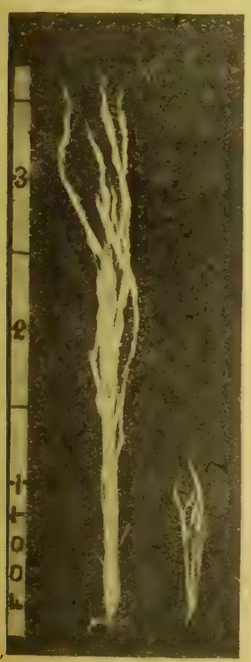

Figure II.
Corn on Drained and on Undrained Land.

IN our issue of June 28th, we published a number of quotations from letters received by Prof. W. H. Day, of the Ontario Agricultural College, in response to a circular letter sent to practical farmers, asking for expressions of opinion re underdrainage. These quotations appeared in the 1909 Annual Report of the Nova Scotia Department of Agriculture, and, with a single exception, all those who expressed an opinion, men who had practical experience in underdrainage and who had carefully watched for results, favored underdrainage as a profit producing operation.

In regard to "Difference in Dates of Seeding," Prof. Day says: "Twenty-six of our correspondents gave us the difference in dates of seeding their drained and undrained land. A summary of their reports is given in the following table:

TABLE I, SHOWING DIFFERENCE IN DATES OF SEEDING DRAINED AND UNDRAINED LAND, AS REPORTED BY TWENTY-SIX FARMERS WHO HAVE DRAINED.

Difference in Seeding Time.	No. Reporting each Difference	Per cent
1 to 2 weeks....	5 out of 26	19.2
2 to 3 weeks....	4 out of 26	15.4
3 weeks or over	17 out of 26	65.4
4 weeks or over	13 out of 26	50.0
5 weeks or over	6 out of 26	30.8
6 weeks or over	6 out of 25	23.1
A whole season	4 out of 26	15.4

It is worthy of note that the great majority reported a gain of three weeks or over. This alone is sufficient in many cases to make the difference between a good and a poor crop.

The figures in Table No. 2 are not averages, but reports of one particular crop in each case, usually the first after the drains were put in. These men are anxious to learn if "underdrains pay," and so went to some trouble to ascertain the yields per acre of the first crop. Only a few mentioned the straw at all, but those who did had about twice as much from their drained as from their undrained land. After the first season it became an old story to see these fields producing bumper crops, and in only a few cases were later records kept. These few show that the advantage of the drained land continues without interruption.

DIFFERENCE IN GROWING CROPS.

Many of those who reported had just this spring sowed their first crop on drained land, and so were unable to give any results as to yield. These and others were asked to select average samples of growing grain from their drained and undrained fields and send them to us. They were photographed and mounted for preservation. Since harvest we again wrote the senders of samples, asking them to report on the yield of the fields, from which they were chosen.

Figure III.
Oats on Drained and on Undrained Land, sent by Mr. John McIntaggert, Brechin, Ontario.

Figure I. shows two samples of fall wheat sent by Mr. R. H. McCurdy, Vienna, Elgin Co. He says: "The tall sample, four and a half feet high, is from drained land, which would grow only swamp grass before being drained; the short one, two and a half feet, is from undrained land Both were sowed on September 14th, 1908, and pulled on July 3rd, 1909. Water-furrows were run through the undrained land." Reporting on the yield in September, Mr. McCurdy says the crop on the drained land yielded thirty bushels and that on the undrained only half as much. The straw, too, was in about the same ratio, as may be seen from the cut.

Figure II. shows samples of corn also sent by Mr. McCurdy. That on the drained land was planted May 20th, and that on undrained June 9th. Both samples

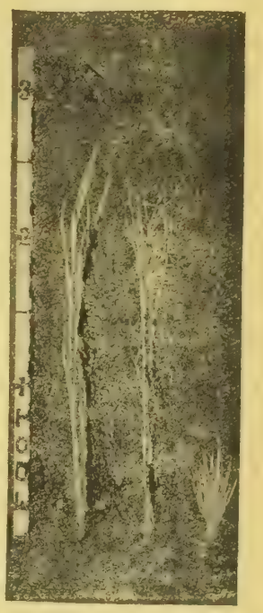

Figure IV.
Barley and Wild Goose Wheat. Samples by Mr. John McIntaggert, Brechin, Ontario.

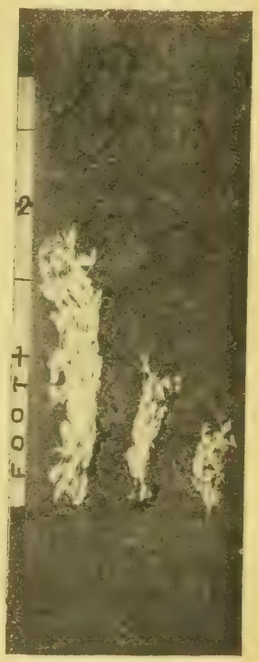

Figure V.
Peas from Drained and Undrained Land. Samples sent by Mr. Peter W. Scott, Belgrave, Huron Co.

TABLE II.—DIFFERENCE IN YIELD.

GRAIN.	DIFFERENCE IN YIELD. Drained.	Undrained.	Difference.	Persons reporting.
Corn	.....	.....	33 to 50 %	James Martin, Amherstburg, and several others
Peas	25 %	15 %	10 "	Peter W. Scott, Belgrave.
Oats	80 "	45 "	35 "	James Marshall, Hamilton.
Oats	50 "	31 "	19 "	John McIntaggert, Brechin.
Oats	35 "	0 "	35 "	William Bell, Washago.
Oats	50 "	10 "	40 "	Peter W. Scott, Belgrave.
Oats	40 to 100 "	0 "	40 to 100 "	J. H. Clare, Chapman.
Oats	50 "	35 "	15 "	J. E. Tovey, Perth.
Fall wheat	45 "	25 "	20 "	James Marshall, Hamilton.
Fall wheat	45 "	25 "	20 "	James Clayton, Cedar Springs.
Fall wheat	.....	.....	30 "	R. H McCurdy, Vienna.
Spring wheat.	25 "	15 "	10 "	John McIntaggert, Brechin.
Barley	40 "	25 "	15 "	John A. McMahen, Petrolea.
Barley	.....	.....	20 "	Joseph Lapp, Cedar Grove.
Barley	50 "	30 "	20 "	John McIntaggert, Brechin.
Barley	30 to 50 "	0 "	30 to 50 "	J. H. Clare, Chapman.
Beans	38 "	3 "	35 "	James Clayton, Cedar Springs.
Hay	2 to 3 tons	0 "	2 to 3 tons	J. H. Clare, Chapman.
Straw	.....	.....	About doubled.	Several correspondents.

were taken July 3rd.

Figure III. shows three samples of oats, number one, two and a half feet high, from low, flat, heavy clay sod, drained, and fall-plowed; number two, half as high as No. one viz; one foot three inches from high loamy, undrained sod, spring plowed and number three, one foot high, from high, loamy, undrained sod, fall ploughed. Mr. McIntaggert, in commenting on the samples says: "Other years I was unable to work the low land till the last of seeding, but I drained it last fall, and this year it was the first land I could work. I sowed it on May 13th, while the high piece from which sample two was taken was not sowed till May 26th, and the other piece on June 1st."

Figure IV. shows barley and wild goose wheat from low, flat, heavy clay, drained and fall plowed, and barley, from same kind of land undrained, and summer fallowed last year, lying right across the fence from the field, which gave sample No. 1. No. I. was sowed on May 13th, No. II. on May 19th, and No. III. on May 28th.

On October 18th, Mr. McIntaggert, reporting on the yields said: "June was very dry here, and July showery, favoring the late sown crops, for the early ones were too far advanced to benefit by the July showers; still my oats on drained land yielded fifty bushels per acre, and those on the undrained thirty-one. As for the straw, there was not such a difference, both lands averaging about two-thirds of a ton per acre. My spring wheat on drained land was good, yielding twenty-five bushels per acre, and a ton of straw, while that on undrained land yielded fifteen bushels per acre and about two-thirds of a ton of straw. Barley on drained land yielded fifty bushels per acre, and nearly a ton of straw, that oo undrained thirty bushels, and half a ton of straw. My crop on the drained land looked so promising that I ordered another car-load of tile and put it in this summer, so that now I have all the wet, flat part of my farm draineh."

Sample No. 1, Figure V., peas one foot nine inches high, land drained and manured; sowed May 5th. No. 2, land drained but not manured, sowed May 5th, eleven inches high. No. 3, from land not drained, sowed April 27th, seven inches high. The dates are worthy of note in this case, as the peas on the undrained were sowed a week and a half earlier than those on the drained, still the latter were much ahead on June 28th, when the samples were taken. Mr. Scott says there were twice as many plants on the drained as on the undrained. Reporting on yield, October 13th, he says: "On drained land the yield was twenty-five bushels of grain, and one and a half tons of straw; on undrained fifteen bushels and one ton. The manured land gave the same yield of grain as the unmanured, but almost twice as much straw. The oats on drained land, of which I sent you a sample yielded fifty bushels and one and three-quarters tons straw, but those on the undrained gave only ten bushels, and half ton of straw."

DIFFERENCE IN FRUIT TREES ON DRAINED AND UNDRAINED LAND.

The foregoing illustrations show in a very striking manner the superiority of grain crops grown on drained land. The difference in fruit trees is even more marked. In the Niagara district two weeks ago, I examined a peach orchard planted in 1905, through which a broad flat extended. On either side of the flat the trees were large and thrifty, about ten to fifteen feet, in height I should say. In the flat, twelve rows were lacking, and small pear trees filled the places. In the lowest part some of these were dying. The owner told me that the whole flat had been planted to peach trees at the same time as the higher land, but that every tree in the low land had died. One or two tile drains would have made the flat produce just as good trees as the knolls did.

UNDERDRAINAGE AS AN INVESTMENT.

Drainage as an investment has been touched indirectly in the quotations already given. Some have stated that their drains paid for themselves in one year, some in two years. Even where the drains were put less than two rods apart, and the cost ran up to $40 an acre, they paid for themselves in two crops. Has the farmer any other place where he can invest his money and have the principal returned to him every year, or every two years?

DRAINED LAND EASIER TO WORK.

Aside entirely from the increase in the crops, there are other matters that must enter into the consideration of the drainage as an investment. For instance, drained land is more easily worked than undrained. All soils contain a certain amount of cementing materials, and the closer together the particles are the more strongly the cements act, just as a postage stamp pressed tightly to the envelope adheres more firmly than one put on loosely. Undrained soil is much more compact than the drained, and therefore its particles are more firmly cemented together; hence when it dries it bakes, so that it is almost impossible to plough it, and even if it can be plowed, it breaks up in lumps that defy the harrow, disc and cultivator, and sometimes even the roller, so that whether wet or dry it is stiff, stubborn, and hard to till. Drained land, however, whether naturally , or artificially drained, is the very opposite; it is but loosely cemented, does not bake, and crumbles readily into a fine seed bed under even a light implement like the harrow. During seeding time when even hours are precious this is a very important consideration, for tillage costs money.

DRAINED LAND IS EASIER ON MACHINERY.

Then again, the old-time, deep water furrow is unnecessary on drained land, and the implements, instead of trundling over lumpy, hard-baked earth, and every now and then dropping into one of these nerve straining, body bruising, machine racking furrows, and almost stopped at every drop, move steadily forward on smooth ground that is soft and yielding. As a horse will last longer on a soft clay road than on the hard city streets, so will machinery last longer on drained than on undrained land.

Now, if underdrainage will move the seeding time ahead three or four weeks; if it will lessen the labor of tillage by a half; if it will give barley, peas, oats and corn twice as high and twice as thick on the ground the first week in July as on undrained land on the same farm at the same date, and under the same tillage; if it will give fruit trees where otherwise they would not grow; if it will double the yield of grain, straw and hay; if it will make every acre that is drained produce $20 more annually than before; if it will repay the cost of drainage every year, or two years at the most—all of which these men say it has done for them—if it will do these things. then is it not high time that underdrainage became a general practice in all the flat, wet parts of the country, as general forsooth, as the practice of tillage.

Clover Hay.

In writing this artice the fact that little clear clover is raised— the usual method being to sow clover and timothy mixed—has been held in mind. However, the first crop is usually so largely clover that the farmer will usually secure the best results by taking the clover at the right time, paying little attention to the stage of maturity of the small amount of timothy present.

THE PROPER STAGE TO CUT.

The proper stage of development of the clover plant to begin cutting for hay depends upon the variety of clover grown.

Mammoth Red Clover, the large, coarse stemmed, kind, does not blossom as early as Medium Red Clover, and produces its heaviest yield of seed in the first crop. Medium Red Clover, the smaller variety, blossoms earlier than Mammoth clover and produces the largest amount of seed in the second crop. If Medium Red Clover is grown and the farmer wishes to secure two crops of hays with as large a yield as possible the first crop may be cut somewhat earlier than if but one crop is figured on. Under this plan the yield of the first crop will be somewhat smaller and the hay will be a little more difficult to cure since it will contain a high percentage of moisture. However, the larger yield of the second crop will usually more than balance this off and the second crop usually makes a better feed than the first crop. If only one crop is figured on with a second crop if the season is favorable, probably the best time to start cutting is when about one-third of the heads are beginning to turn brown. At this stage in the development of the plant the largest weight of palatable and nutritious hay will be secured. Of course, if a large amount is to be cut, operations will have to be started earlier in order to get the field finished before the last part gets too far along to make good palatable hay.

AVERAGE YIELD OF HAY AND [illegible] OF THE CLOVER PLANT CUT AT VARIOUS STAGES.

	Yield Fresh Substance	Protein	ether extract	Crude Fiber	Nitrogen Free Extract	Ash
Clover full bloom	3722	411	158	671	1269	212
Clover (some heads dead to nearly out of bloom	3417	366	116	888	1183	192

The above figures compiled from results obtained from three experiment stations show that the largest yields of green matter containing more of all of the valuable nutrients with less crude fiber which makes hay strawy and unpalatable were secured from the earlier cuttings.

TIME OF DAY TO CUT.

Clover may either be cut late in the afternoon when it will wilt little and consequently be little harmed by the dew which will accumulate largely on the upper surface of the swath. This dew dries off quickly in the morning. The other method is to cut after the dew is off in the morning. Cutting in the late afternoon gets the curing process along more rapidly next day usually but the method used must be chosen to suit local conditions as must also the method of handling after.

CURING THE HAY.

There are two general methods of curing. One is to rake the partly cured hay in the afternoon and put it into good sized cocks built narrow and rather high. The hay is allowed to stand in the cocks for some time to finish curing. More clover is cut and put into cocks each day until some is sufficiently cured to be hauled in. The cocks are opened up and, if necessary, allowed to dry a short time and are then hauled in. In good dry weather this method is frequently modified in that instead of putting in large cocks, the hay is loaded from the windrow and put in stacks or barn immediately. The other method is to allow the hay to become sufficiently dry to load from the swath or from a windrow made by the side-delivery rake, with the hay loader. The first method has the advantage in that in the cocks the leaves and stems dry at about the same rate which prevents the leaves from falling off and being lost. This is an important matter since the leaves form the more palatable and nourishing part of clover hay and their loss in handling causes serious deterioration in feeding value. It has the further advantage in that hauling may proceed in a short time even though a heavy dew or light rain does fall. It has the disadvantage of requiring much hand labor. By following the second method hay may be put up more economically during favorable weather on account of the use of labor saving machinery. The disadvantages of this method are that a heavy dew or even a light rain causes a deterioration in the feeding value of the hay and stops hauling-in operations until the hay is again sufficiently dry to proceed. Also each time the hay becomes wet and dry again the leaves dry more quickly than the stems and more leaves are lost, with a consequent loss in feeding value. The following table taken from Henry's Feed & Feeding, shows the results of one analysis of good clover hay as compared with one rained upon.

Water	16.	16.
Protein	14.6	15.8
Crude fibre	25.3	37.4
Nitrogen free and other extracts	36.1	23.4
Ash	8.	7.5

Although this table gives the result of but one analysis it shows that clover hay that has been rained upon has lost a large per cent. of the nitrogen free and other extracts with a consequent gain of crude fiber. This change makes the hay unpalatable and lower in nutritive value.

LOADING HAY.

If clover hay is unloaded with a single or double harpoon hay fork, forkfulls will be obtained much easier if either the front half or the back half of the load is put on first just about what will make a good hayfork full. Then load the other half using care not to lap the hay in the middle. In unloading, the load parts easily in the middle giving better sized fork loads with less strain on the horses that are operating the hayfork in pulling the load apart. Loading this way seems some bother at first but it is no harder than the other way and the unloading goes much more rapidly.

STORING CLOVER HAY.

Clover hay may be put up in compact stacks or in large, tight mows while it contains a larger per cent. of moisture than if stored in loose stacks or in small mows where it is not well compacted. If put up in a partly green condition, however, it will not retain its bright color, but changes to a dark brown. This change in color usually lowers its selling value on the market, but does not injure its feeding value unless put in, in so green a condition that it becomes musty. Care should be exercised in putting partly cured hay in the barns on account of reported instances of spontaneous combustion.

COST OF PRODUCING CLOVER AND TIMOTHY HAY MIXED.

The following figures were gathered at Northfield, Minnesota, and are reported in Bulletin 73, Bureau of Statistics.

The cost of two crops including land rental at $3.50 per acre, is given as $7.17. Figuring on an average yield of 3 tons per acre this makes the cost of mixed hay on the farm $2.39 per ton. The feeding value of this mixed hay is estimated by Professor Haecker at $6.35 as compared with timothy hay at $6.00 per ton.

Some Words of Cheer From Charlotte County.

We take pleasure in presenting to readers of this issue of the Maritime Farmer, two photographs taken from scenes on Elm Grove Farm, steading of Mr. Edwell E. Emerson, who resides in the little village of Greenock, about 14 miles from the town of St. Stephen, Charlotte County, N. B.

One has only to look at the well kept stock and buildings on Elm Grove Farm in order to see that Mr. Emerson is a firm believer in the opportunities offered by the East. A short time ago we wrote Mr. Emerson re the agricultural prospects in Charlotte County. In his reply, he shows that what he himself has done in the line of farming in his county another can do likewise.

His letter reads in part as follows. We frequently hear some of our would-be farmers say: the larms of Charlotte County are going back," or, in other words, "are getting run out" and "farming does not pay." I do not think these statements are correct and my reasons for thinking so I deduct from my own practical experience as a farmer in this county.

When I bought my farm, twenty years ago, it was in a pretty poor or so-called run out condition. The winter before I bought it, it would only winter five head of cattle and one horse. The acerage has not been increased but we have tried to improve our conditions so that now we keep twenty-four head of cattle some sheep, pigs and two horses. I have never bought over five tons of hay since I bought the farm and I have sold very little hay off of it.

We are following a system of mixed farming, growing as much feed as we can, feeding everything on the farm to twelve milch cows, some pigs, sheep and about twenty hens.

I believe a farmer should keep a little of all kinds of live stock and keep at it not only when prices are good but stick to it also in the season of low prices. Too many farmers are inclined to rush into a line of farming or stock raising when prices are good and in this way overdo the matter and when prices go down they go out of the business. In this way they lose the profits that come to those who stick by an industry through thick and thin. It is the farmer who remains with the job who is going to succeed. I did not know a great deal about farming when I started but I am constantly learning something along my line of work. I make mistakes at times but I try not to repeat them. Charlotte County is good enough for me and I am fully convinced that if we pay the proper attention to our farms in this county, we can make a good living and have a little to lay by for a rainy day."

We will at some future time get from Mr. Emerson an account of how he built up his worn out farm. In the meantime our readers will appreciate his optimistic spirit. May his shadow never grow less. We need more boosters and fewer knockers in order to bring Maritime Canada to that position of pre-eminence in agricultural lines that is warranted by her geographical position, her industrial opportunities, and her intelligent citizens.

Ventilation of Cow Stables.

We notice that with a great many farmers they object to putting the King system of ventilation in their cow stables because of certain objections that present themselves. For instance one farmer said to us "It is all very well to talk about changing the air every hour in the stable as you do, but how are you going to do it in cold weather without reducing the temperature too low for the cows to give milk profitably?"

That would be a sound objection if true. It can be answered however, in this way: In our own stables the mercury never goes below 50 degrees or 60 degrees even in the coldest weather. Cows will give milk readily in this temperature. How is it done? In this way: Build the stable walls of wood and paper, not stone. If built of stone or brick make three walls, or two dead air chambers.

In building of wood follow this plan: The outside row of studding is 2x4's. On the inside edges tack on heavy building paper. Then nail a 2x2 inch stud on each 2x4, and cover again with paper. Now you have two dead air spaces one four inches thick, and the other two inches. Nail on another 2x2 in same manner as before, and cover this with paper. Now you have three air spaces. Then cover the inside of the stable with matched boards, leaving the top board to be nailed afterward. You have now a stable wall eight inches thick with three air spaces, a most complete insulation against outside cold.

When you put in the intake air registers, follow this plan: Use 8x10 or 10x12 registers. Set the outside ones—one for every two cows,— in the drop siding about two feet above the sill, midway between the 2x4 studding; this makes a good flue for the pure air to flow up into the stable. Then go on the inside and cut out the layers of paper in each of the studding spaces where you have inserted intake registers outside. That will let the pure air up and into the stable at the top of the room. Now tack the top board of the inside lining in place and cut out a space for the inside register, which has an open and shut contrivance.

The pure, cold air will constantly rise and flow into the room through the warm air at the top of the stable; but the warm air being lighter cannot flow out and down to the outside register. This arrangement of the walls and air registers makes a room where you can control the incoming and outgoing of the stable air, hold its warmth, which is supplied by the bodies of the cows, and have a constant change of air.

Of course the outflow of air is governed by the big flues that take the foul air from off the stable floor and discharge it, say, four feet above the ridge of the barn. These flues should have a capacity of about two feet square for every twenty animals in the stable and should be absolutely air tight from bottom to top or else their draft will be seriously diminished. With stable walls and ventilation fixtures constructed as we have indicated, the farmer can have a warm stable room and a constant supply of fresh, pure air.

One thing more, insert a window, 2x3 feet in size for every two cows. Face the cows out so they will get the fresh air and you have a stable your cattle will call blessed and they will show their appreciation by a largely increased flow of milk because they are healthy and vigorous.

Elm Grove Farm.
Home of Edwell E. Emerson, Greenock, Charlotte, Co., N. B.

Some Elm Grove Farm Dairy Cattle.
Owned by Edwell E. Emerson, Elm Grove Farm, Greenock, N. B.

Finest Cattle Sheds in America.

"I have travelled all over this continent, and have religiously inspected all the live stock accommodations at the principal fairs, and have no hesitancy in complimenting the Dominion Exhibition Executive in St. John New Brunswick, upon having the most thoroughly up-to-date and luxurious accommodations for animals I have ever seen." This strong statement was made by a well-known cattle breeding authority in one of the Maritime Provincial newspapers a short time ago after a visit to the completed buildings on the St. John grounds where the Dominion Exhibition for 1910 is to be held from September 5th to 15th. The cattle accommodations referred to include one gigantic sloping cattle shed, in which 500 head can be accommodated — affording visitors a comprehensive view of this department at a glance. The long commodious stalls are fitted with patent troughs, fresh water faucets, special ventilation, brilliant lighting and natural drainage. The sheep pens, piggery, horse boxes and poultry houses are alike new and modern. The architectural designs for these structures were made from the best cattle accommodations heretofore standing, with special facilities made possible by the sloping condition of the St. John grounds. The safety and cleanliness of the animals and the convenience of sight-seers have been kept in mind throughout the erection of these buildings.

Hay Should be Cured with Hay Caps.

We would like to know what the advantages are by using the hay caps on mixed clover and timothy hay, providing we have sunshine to cure it. Of course, that is simply a chance but what we want to know is whether if this hay is cured and put in the barn inside of three days from the time it is cut, with sunshine all the while, the hay would be just as good as if it had been capped and why? Kindly advise and oblige.

The B. O. Co.

It should be remembered that the curing of hay is not simply a driving process. When hay is exposed to the sun, much of its nutritious properties are lost; just what we cannot say. For instance, grass cut in the pasture where the cows are grazing, is tender and juicy; when dried in the sun and the same amount of this dry feed given to the cow as of the succulent grass, she will not produce as much product as she would if she had been permitted to take the grass in its juicy form. What has passed from the grass in its curing process and what changes have taken place in the elements in the grass, of course we cannot say, but we know that the dried grass will not give as good results as when it is green and in the succulent stage. Moreover, we feel certain from our own experience that hay cured in the shade is far more palatable and more nourishing than when it is exposed to the beating sun's rays; for this reason it is to the advantage of all concerned to cure hay in the shade. In other words, the action of the sun's rays does not improve the quality of the hay.

And all this is but an amplification of the principal followed by our mothers and grandmothers in curing the herbs gathered for domestic use whether for medical or other purposes.—Hoard's.

THE MARITMIE FARMER

And Co-operative Dairyman.

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers, and Dairymen's Association of New Brunswick; The Nova Scotia Farmers' Association The Nova Scotia and P. E. Island Fruit Growers' Associations The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers Association, and The New Brunswick Poultry Association.

Subscription Price **$1.00** per year. **When paid in advance 80 cts.** Persons taking advantage of the 80 cent rate when subscribing are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definite order for dis. continuance is given.

The date after your name on the little green label on front Page is, in every case, the time which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—**"I saw" your adv. in the MARITIME FARMER.**

PUTTING THE CONSUMERS' COIN IN THE PRODUCERS' POCKET.

The amount of money spent for milk, butter, cheese and the lesser dairy products is unquestionably stupendous. In every, city, village and hamlet of the land there is always a good market for these. Unfortunately the profits between the producer and the consumer often make the amount that the farmer receives disproportionate with what the latter pays ; that is, the producer does not receive a proportionally high price and the middleman gets more than his share of the profit. Nevertheless the road which all this money travels leads through the dairy barn. The dairy barns of the land are the vital factories in the diversion of the consumer's coin to the producer's pocket.

SOME IMPORTANT HOLSTEIN FRIESIAN RULES.

The following important rules that have for their object the maintaining of stamina in the herds were passed by the Holstein Friesian Association at their last annual meeting :

A rule was adopted in regard to the breeding age of heifers which will have an important bearing upon the future of the breed and directs the secretary to reject applications for the registration of calves born from immature heifers ; the age at which a heifer may be bred being limited to nine months.

Another important rule was laid down by the board of officers for the guidance of the secretary's office. This rule relates to the time elapsed after calving at which a cow may be put to bull. It having appeared that applications for registry were being filed upon which date of service was alleged to have been at periods varying from the very date of calving to less than three weeks thereafter, it was ordered that applications for registry be rejected which showed that service had taken place within 21 days of last calving.

LEARN MORE ABOUT POULTRY.

There is always something to learn in the poultry businass. No one can know it all, and what may be the truth to-day may be an error tomorrow. Those who endeavor to learn from others who have succeeded will make fewer mistakes and in the end be more successful than those who depend upon themselves entirely. Some things, of course, must be worked out by each individual. Each fowl differs from other flocks. Individuality and the influence of enviroment have to be considered. There is room for great improvement among the fowls of each breed, and the breeder cannot afford to neglect the study of his fowls and of the conditions which relate to their practical management. The intelligent poultryman who is in the business either for pleasure or for profit, keeps himself well informed on all the matters that relate to poultry, and if at first success does not reward his efforts he will soon learn wherein he has failed.

MARITIME FARMER AND CO-OPERATIVE DAIRYMAN, Sussex, N. B.

GENTLEMEN :

We beg to advise you that we have recently received some substantial orders for "Cow Ease" from Bermuda.

These orders are directly traceable to an advertisement which we carried for some time in your publication and you may rest assured that we will make arrangements to do further advertising in the same medium.

Yours truly,
MARITIME PAINT & VARNISH CO., LTD.,
Guy E. Martin, Mgr.

A QUITTER NEVER GETS ANYWHERE.

Every man who ever did anything really great did it by himself. Success can't be gained without confidence. Half the fibre of achievement is egotism. It is the force that carries the struggler to goal. He must believe in his ability—he must possess so much tendency and courage that others become infected with his assurance. When he meets with disbelief and discouragement, his own faith has to support and sustain him. And such faith is only to be arrived at by training, just as the athlete's stride is the result of months of effort and the hammer-thrower's form is the outcome of untiring practice.

Self condfience is a moral muscle which requires development. It is not different from any other thew and sinew—it can only grow strong through use. If you never try, no one will ever try for you. If you don't make a start no one will give you the impetus. The world is selfish—every individual is endeavoring to the best of his might to utilize his knowledge and experience and advantake to his own profit.

Only the ambitious achieve, and ambition, without initiative, is a useless possession. It has as much value as a gun without amunition.

Big things are hard to get, otherwise they would have no value. Ground fruit is easier to pick than that on the tree, but if it were sound it wouldn't lie so low. What is not difficult to secure can be just as readily gotten by every one else. The little posts are always hardest to hold because they require so little ability to maintain the competition among men who can fill them is many times more intense than the striving higher up.

Contentment is rust—men who are satisfied with what they have done soon cease to be of value to themselves and others. Every twenty-four hours produces a change in the ways of doing things, and the self-complacent man, content with his knowledge and his opportunity, soon becomes a back ledge and his opportunity, soon becomes a back number—he stands still while things are moving forward.

Don't be afraid of risking your present position—if you possess enough ability to hold it, you can hold another. On the other hand, if you are not that capable, sooner or later some one better qualified to do what you are doing will get your place.

"He who is afraid to venture his bait will never fish"—if you believe that you possess the power to do better things than you are doing—if you think that you are gifted with capacity to fulfil greater responsibilities, you will stay where you are until the end, if you don't make the effort to climb to where you rightly belong.

Suppose you do undergo a setback or two on the way to greater prosperity, if you're not willing to stand and stumble, you haven't grit and courage enough to hold on to things after you get them.

Every man who ever shinned up a tree had to slip down the trunk time and time again until he caught on to the branches and pulled himself up. Every new swimmer keeps sinking until he finds how to use his arms and legs in water. A quitter never gets anything.

CO-OPERATION BY BRITISH FARMERS.

The benefit reported to be derived by farmers from their co-operative societies in continental countries, especially Denmark, has stimulated the formation of like societies in the United Kingdom.

The Midland Farmers' Co-operative Association was formed in 1906 It now has 401 members, covers the counties of Nottingham, Derby and Leicester, and is extending its operations into Lincolnshire. There are larger farmers' societies in the country, one in Wales having 900 and one in Suffolk and vicinity 1,000 members. All are growing in membership and seem to be of substantial advantage to the farmers concerned.

The Midland association, through its general office in Nottingham, disposes of the product of its members' farms, excepting the live stock. For instance, a member sends samples of his gain to the office. Officials keep themselves informed as to the best markets and sell to the highest offer, by means of the samples. Similar methods are used with other products. A small commission is charged by the general officer for its service, which charge is believed to be less than the grain to the farmer by dealing through the well-informed intermediary. The manager of the association personally attends to the grain and cattle markets held on stated days in the district, and thus is always fully acquainted with prices and conditions.

Through the general office the member buys supplies for his farm—machinery, fertilizers, seeds, cakes for stock food, oil, coal, etc.; not, however, groceries or other family commodities. The office issues a monthly price list, for members only, giving the cost of the various articles delivered or at seaports. In the latter case the freight charges from the seaports to the principal towns in the district are stated. All the prices are said to be less than the member would be charged if he individually bought the supplies. In addition, the member is assured that his purchases will always be of the best quality and character. Articles bought or sent by the seller directly to the farmer. Any complaint or dissatisfaction is dealt with and the cause removed, if possible, by the committee of the association.

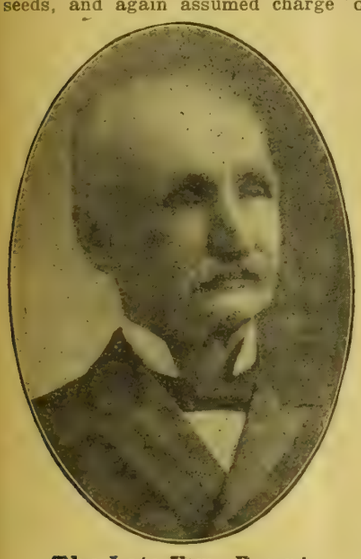
The monthly price list contains, besides the cost of supplies, suggestions and information regarding the best farming devices and methods and probable changes in prices and trade conditions. The annual cash business of the association is now about $125,000, and has steadily increased each year. The expenses are about 3 per cent. of that amount. The income from commissions and other sources paid 5 per cent. divided to the shareholders in 1909, a fair interest for each member's investment, leaving as clear profit all that he gains by dealing through the association.

The present paid-up capital of the association is $2,500. Each share costs five shillings, paid by instalments, as required. Every member must hold one share, and no more, for each ten acres which he occupies, subject to the proviso that he must hold not less than four shares.

A Great Man has Passed Away.

Our readers will be sorry to hear that Mr. Wm. Rennie, the well known seedsman and agrirulturist, who has been in poor health for some time past, died at his residence, Swansea, Ont., Sunday morning, July 24th. Ontario farmers and many other agriculturists throughout the Dominion are well acquainted with the work that Mr. Rennie did for the advancement of Canadian agriculture.

Mr. Wm. Rennie was born in 1835 in a humble log cabin in Scarboro. His father and mother having emigrated from Scotland a few years previous were in very poor circumstances. His early days were spent on the farm. Many farmers of the present day are familiar with the Rennie homestead in Scarboro, which has long since been known as the "Gold Medal Farm," of Ontario. In 1860 Mr. Rennie left the homestead and started farming for himself on the second concession of Markham, near Richmond Hill. In 1870 he rented his farm and moved to Toronto, where he established a seed business, which is to-day one of the largest concerns in Canada. Shortly after establishing his seed business. Mr. Rennie found it necessary to grow a large portion of his seeds, and again assumed charge of



The Late Wm. Rennie.

his farm. With more improved methods and a better knowledge of agriculture, he developed his farm so that in 1884, in competition for the best managed farm, Mr. Rennie was awarded the first silver medal, while his brother, Simpson Rennie, won the gold medal. Mr. Rennie's farm was the centre of some very interesting gatherings in connection with what is known as the "Markham Farmers' Club." These annual reunions used to bring together upwards of a thousand people.

Mr. Rennie retired from business in 1889, leaving the now well-known Rennie seed establishment to his three sons—Robert, John and Thomas. In 1893 he was asked by the late Hon. John Dryden, then Minister of Agriculture, to take the position of Farm Superintendent at the Ontario Agricultural College at Guelph, to demonstrate his new ideas regarding agriculture. This he did, and remained with the College for six years, bringing the farm to a high state of cultivation and thoroughly demonstrating his methods. Upon his return to Toronto he put into book form all his valuable information and experience in a volume known as "Successful Farming," a book which has been read with profit and interest by many of the farmers of Canada.

Through his skill and enterprise in agriculture and related pursuits, Mr. Rennie was brought a good deal into public view and although he has been for some years living a very private life, he is still well remembered by an unusually wide circle of intimate friends.

Mr. Rennie is gone. A great man has fallen, but the good work he has been able to accomplish, by leading the way in stimulating an active interest in better agricultural methods, will not be buried with him but will remain a lasting monument to his memory.

The College Holsteins on Farmers' Day.

Potato Blight.

THE KINDS OF BLIGHT.

There are in this country two diseases of potatoes which commonly go under the name of "potato blight". One is known as "early blight" (Alternaria solani), and the other as "late blight" (phytophthora infestans.)

The late blight seldom makes its appearance in the Maritime Provinces before the first of August, and may appear at any time from then on to the end of the season. When the weather conditions are favorable, it is very rapid in development and very destructive.

A healthy looking potato field may be destroyed under its attack in the course of only a few days. It begins near the ground and rapidly works upward on the plant. Fields affected emit a peculiar, characteristic color.

EARLY BLIGHT.

Early blight does not require as favorable conditions for its development as are necessary for late blight It is a disease which may begin to affect the plants early in June or any time thereafter. It is usually most destructive in July and August. The disease appears as brownish spots on the leaves. It usually attacks the ends of the leaves, where the moisture evaporates last, more than it does the other parts of the leaf surface. It is much slower in action than late blight. Weak plants suffer more from its attacks than vigorous ones. The injury it does is undoubtedly greater on late plantings of the early varieties and on late plantings of early varieties than it is on early plantings of late varieties. The latter are often nearly mature by the time this disease becomes serious.

SPRAYING FOR EARLY BLIGHT ON EARLY PLANTINGS OF EARLY VARIETIES.

The indications are that it will not pay to spray with Bordeaux mixture on early plantings of early varieties, but this has not yet been definitely proven. Wherever it is to be done, it must begin when the plants are small—about eight inches high, and continue about every ten days, until about ten per cent. of the leaf surface well covered with a ease, after which it is not likely to be any longer sufficiently effective to be worth while. In very rainy weather, the applications should be sufficiently more frequent to keep the leaf surface Rell covered with a coating of Bordeaux mixture. When the spraying is begun while the plants are small, an application of twenty-five to thirty-five gallons of Bordeaux mixture per acre will usually be sufficient the first time. The second application should be increased to about fifty gallons per acre, and the third and subsequent applications should be at the rate of sixty to seventy-five gallons per acre. Thorough spraying, under a pressure of about seventy-five pounds from a nozzle of the Vermoral type, is essential to success. One nozzle per row is sufficient for the first application, after which two nozzles per row will be needed.

SPRAYING FOR EARLY BLIGHT ON LATE VARIETIES OF POTATOES.

Spraying for early blight on late varieties has proved profitable at the Experiment Stations. For late varieties, the first application may be delayed until the earliest varieties in the neighborhood show signs of the presence of this disease, when the spraying should be no longer delayed. Since the plants are usually of fair size by this time, the first application should be made with two nozzles per row, using from sixty to seventy-five gallons per acre, and the same for all subsequent applications. The frequency of spraying should be about every ten days except in rainy weather, when it should be made more freuhently, as was above recommended for early varieties.

HOW TO MAKE BORDEAUX MIXTURE.

The strength of Bordeaux mixture to use in spraying for potato blight is: 5 pounds of bluestone (also known as copper sulphate and blue vitriol) and 5 pounds of the best grade of stone lime to 50 gallons of water. The bluestone can be dissolved most readily by hanging it near the top of the water. The lime must be fresh, and of the best grade, and should slake readily. It should be slaked several hours or more before it is wanted. When ready to apply the Bordeaux mixture, the bluestone solution, containing the five pounds of bluestone, should be podred into the sprayer barrel and diluted to about thirty-five gallons. The milk of lime, containing the original five pounds of stone lime, should then be diluted to about fifteen gallons, and poured into the diluted bluestone solution. The resulting product is the Bordeaux mixture, ready for use. Any poison needed for potato beetles may then be added, thus spraying for blight and the potato bugs at the same time.

TESTS FOR BORDEAUX MIXTURE

If the lime used is of low grade, there is danger of burning of the foliage from the Bordeaux mixture. A good test is to hold the point of a knife-blade in the mixture for a short time. If copper collects on the blade, more lime must be added to prevent injury.

A good chemical test is by means of potassium ferrocyanide. Dissolve an ounce in a small quantity of water. To test the Bordeaux mixture, take out a dipper-full after stirring well, and let settle for a few minutes. Then pour into it a few drops of the potassium ferrocyanide solution. If a rust like sediment forms, more lime must be added. If no sediment forms, and there is only a slight yellowish discoloration, sufficient lime is present. Potassium ferrocyanide is a very deadly poison.

STOCK SOLUTIONS FOR BORDEAUX MIXTURE.

Stock solutions of bluestone and lime save much trouble when Bordeaux mixture is being used on a large scale. A stock solution of bluestone may be prepared by dissolving in a keg or earthen jar all of the bluestone that the water will hold. A supply must be left hanging in the top of the water at all times in this method. A gallon of such solution will contain three pounds of bluestone, and the amount taken out can be adjusted to the number of pounds of bluestone desired.

A stock solution of lime may be prepared by slaking a certain number of pounds of lime and adding enough water so that each gallon will contain two pounds of lime. The milk of lime mixture must be well stirred before taking any out, or there will be danger of not getting enough lime into the Bordeaux mixture to keep it from burning the foliage.

CLOSING CHARGE.

Throughout all this work, it must be remembered that high pressure, thorough application, constant agitation, and careful straining are essential to success.

Renewing the Strawberry Patch.

Scant or improper cultivation at the right period is one of the main causes for so many failures in strawberry culture.

If the strawberry patch has been well cultivated and cared for it may be retained from three to five years. At the end of that period new plants should be secured and set out.

Renewing the strawberry bed should be done as soon as possible after the last picking of the fruit, in order that the new plants may become fully developed before severe or freezing weather sets in.

Mow the vines close to the ground allow the mulch to dry, and remove it from the bed. If the mulch is evenly distributed and not too deep it may be fired. Of course, one should do this when there is a brisk wind to carry the fire quickly over the bed so that the heat will not remain long in contact with the plants.

The object of this fire is to destroy all fungous disease and insect pests which may be present; and while the vines may appear greatly damaged at the time of the fire, they will spring up with renewed vigor in a very short time. Also, if the vines are thus treated nothing is left to hinder proper cultivation. Where immediate removal of the mulch is desired it may be raked up and hauled to other portions of the farm for fertilizing purposes, but if it is not too deep we would advise turning it under as a fertilizer for the strawberry plants.

After the above treatment plow the soil away from the side of the row, being sure to leave a few inches of the new vines on each side of the row, as the young vines are more prolific than the older ones in sending forth runners. When the middles are plowed harrow the rows lengthwise; then crosswise not less than twice—more if desired, as the harrowing pulverizes the soil and puts it in fine condition for the plants to grow, and for one to give them ideal cultivation.

Use the cultivator from this time on, always plowing the rows the same way each time and keeping it well away from the vines as far as you wish the row to become rooted. If the rows get too wide before the second or third plowing attach rolling cutters to the cultivator and keep the vines cut off the proper length. At about the third plowing sow the patch to oats and harrow them in, taking care that the new plants are not torn from the ground. This crop will form a luxuriant growth before severe weather comes on and, falling over, furnishes fine protection from the severity of wintry weather. Then, the following spring, the rank, dead growth will form one of the finest, if not the greatest, mulch for the vines, which are then ready to put forth for the coming crop.

This article is intended for the more extensive grower of strawberries. The farmer with a moderate sized bed for home consumption only, or a bed handled in connection with intensive agriculture, should have rows only eighteen inches or two feet apart, and would of necessity have to be spaded up, being treated on other points the same as the more extensive beds.

M. COVERDELL.

The Hazards of the Apple Deal.

At no time in the history of the apple business of this country has the fact that an unusual hazard exists for the buyer, small and large, in connection with the purchase of the fruit been so prominent as now. It is appreciated by a few. Experience has taught some the evils of hasty purchase, but in a good many instances the lesson learned in the process of forced liquidation of assets in the shape of fruit on which costs have accumulated at the end of one season, have been forgotten before the advent of another. The few wise ones have stayed out until the high pressure has been expended, and there are a few operators in this market who are prosperous examples of prudence. The great error made by a speculator is in his undervaluation of the business acumen of the grower, and in the fact that in a good many cases too little knowledge has been gained concerning the production (volume) of the total crop. Speculators have lost their "shirts" on the underestimating of the crop. It has been years since this country produced a really short crop of apples, and well posted authorities in the apple game have come to admit that there is now no such thing as a short apple crop.

If the game to be played were left in the hands of the men who know, the distribution of any one season's crop of apples would be a thing easy to compass and at some profit to both grower and operator. But such a thing is not possible. Along with each crop of apples is grown the reckless, ill-informed buyer who, fearful of being left, rushes to the grower with propositions. The grower plays the hungry buyer to the gaudy fly and the inevitable result is the high prices. This method of procedure injures grower, operator, speculator, jobber, retailer and consumer. It has the effect of causing a high opening market, further excites the cupidity of the grower, and not infrequently causes him to lose a chance to sell the balance of his crop. This failure to sell is the boomerang that hits back at the reckless operator and the interests behind the sale of the apple crop. The balance—no matter who holds it—is the thing that comes in just before the first snow flies and forces down the market on high-priced apples. It is always a big factor when the market opens high and the influence of it is seen in the apple situation for months when the trade should be the heaviest. The injury done to the trade is told in market reports of nearly every year in the last ten. The heavier the unsold balance the longer the period of depression. In one or two seasons in years the effect of common stored goods on market values has been pronounced all through the selling period.

Of late the trade has shown a great deal more interest in this big question of apple buying. Some skilled operators have gone into the matter thoroughly, and this examination of the situation has developed the fact that the only safe thing to do is to go slowly. The safe course for the buyer is the pursuit of a waiting policy. This means that instead of the buyer seeking the seller, the latter should seek the buyer. If the experience of last season has taught anything, it has set the seal of approval on the waiting policy. The buyer has all to gain and nothing to lose in the apple campaign, since sooner or later in the season he is sure to get his chance to buy on terms that will leave a margin of profit, always, of course, provided he is not one of these who rush on to boost the price to the grower.

Now that there is little prospect of a short apple crop in any year, the road of the apple operator is a different as well as a more difficult proposition. Knowing as he does the extra hazard that exists in the game to the early buyer, there seems to be warrant for the belief that every section of the country will be carefully scanned before any deals of consequence are made by the heavyweights in the buying movement.—Fruitman's Guide.

Troubled with Heart

NERVES WERE ALL UNSTRUNG

Mrs. Oscar Hamilton, Forest Glen, N.S., writes:—"I can truthfully say that Milburn's Heart and Nerve Pills have been a great friend to me. A few years ago I was very much troubled with my heart and my nerves were all unstrung, I had terrible pains all through my body. I was weak and had frequent and severe dizzy spells, and was continuously having to consult doctors. I had Milburn's Heart and Nerve Pills recommended to me and after having taken a box they appeared to help me so much I continued to take them, and was soon able to do my work again. For this I am very grateful and would advise all people with weak heart or unstrung nerves to give them a thorough trial."

Milburn's Heart and Nerve Pills are the original heart and nerve cure and are sold at all dealers for 50c per box, or 3 boxes for $1.25, or will be mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Extension to breakwater, Richibucto Cape, N. B.," will be received at this office until 4.00 P. M., Wednesday, August 17, for the construction of an extension to the breakwater at Richibucto Cape, Kent County, N. B.

Plans, specification and form of contract can be seen and forms of tender obtained at this Department, at the offices of E. T. P. Shewen, Esq., District Engineer, St. John, N. B.; Geoffrey Stead, Esq., District Engineer, Chatham, N. B., and on application to the Postmaster, Richibucto, N. B.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and signed with their actual signatures, stating their occupation and places of residence. In the case of firms, the actual signature, the nature of the occupation and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Honourable the Minister of Public Works, for the sum of two thousand three hundred ($2,300.00) dollars, which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By Order,
R. C. DESROCHERS,
Asst. Secretary.

Department of Public Work,
Ottawa, July 16, 1910.

Report of Inepector W. McIntosh for Spring of 1910.

Hon. D. V. Landry, Commissioner for Agriculture, Fredericton.

Sir: Acting upon instructions received from your department that a reasonably careful search be made for the brown tail moth in this province early in April I began the search. It was thought best to examine those sections where the moth may be expected to appear, namely the City of St. John and vicinity and the parts of Charlotte county bordering on the infected area in the State of Maine and the railway and highway roads leading from Maine. All fruit trees within one hundred yards of the road or railroad were searched and a sharp lookout kept for nests on the forest trees. All schools passed en route were visited and a short talk given on the brown tail moth, actual specimens being shown and a colored plate illustrating the life history of the moth left in each school. Your inspector found it necessary to return to St. George and found the school children had thoroughly searched the trees in the vicinity and a number of summer nests of the cherry tortrix, which are very much live the brown tail nests, were removed and examined and one sent to St. John for identification. Since the inspection was made the teachers and school children of a number of the schools visited have been sending insects for examination showing that a watch is being kept for dangerous insects.

The search was commenced in St. John city and suburbs, the area was most carefully gone over. Nearly every year male brown tail moths are taken in the city of St. John; this is not surprising for each summer large numbers of persons come from the infected districts in Massachusetts and moths are probably brougnt on clothing and baggage.

The search in Charlotte county was commenced at St. George and continued along the main road to St. Andrews, the section bordering the St. Croix was inspected, St. Stephen and Milltown were visited and the highway road and railroad from Welsford to St. John.

Sixteen days were devoted to the search and we are pleased to say no traces of the brown tail moth were found in the districts visited.

Though the brown tail moth has not yet become established within the province, a number of adult male moths have been taken as previously stated, and we may reasonably expect it to appear, as it is found in large numbers in the State of Maine and also occurs in Nova Scotia. The moth was first noticed in Summerville, Mass., about sixteen years ago. It is an European insect which doubtless had been introduced into this country by accident.

Since its introduction it has spread rapidly and has proved one of the most dangerous insect pests known. Last year a half million dollars was spent in the State of Massachusetts for the suppression of brown tail and gypsy moths. This included the state's annual appropriation of $265,000. The State of Maine makes an annual grant of $17,000 for the suppression of these pests. Wherever these insects have obtained a footgold and have been allowed to increase without being recognized, they have occasioned great loss and the expenditure of large sums for their suppression. Therefore, it is desirable that we should take measures to recognize and deal with them before they become established in any section of the province.

Respectfully submitted,
(Signed) WM. McINTOSH.

Spraying Increases Profits.

"If you neglect to spray your fruit you will not have success; spraying is the link between success and failure in fruit growing," were Mr. Farrand's initial words in the address he gave on "Spraying for Insects and Diseases" at the meetings of the Niagara Peninsula Fruit Growers' Association in March.

Different formulae had to be used in different emergencies. A mixture of four pounds of lime to six pounds of blue vitrol to 40 gallons of water, had proven a general remedy, for many diseases. Black rot in grapes was prevented by Bordeaux. The lime and sulphur mixture was efficient for San Jose scale and other fungous diseases. The peach has a tender foliage and the strong mixtures that plum and apple foliage withstand, should be used with great care if put over the former trees.

Proper spraying is one of the preventives of fungous and insect pests if done at the proper time. A delay of a day or two may cause a loss of money. Results were obtained in proportion to the spraying done. "Put your mixtures on liberally," was the speaker's advise.

Different processes and utensils for the work were touched on. "There were men," said Mr. Farrand, "who believed that good results could ne obtained by hand spraying, but this was not successful as tests had proven," The method took up an enormous amount of time; in fact, a power outfit would do the work three times over in the time it took a hand pump. The gasoline engine was, in his opinion a satisfactory solution to the labor saving problem.—C. A. S.

DAIRYING.

C. W. McDougall, Dairy Inspector, staff Contributor.

Preserving Butter in Summer.

William H. Underwood in Country Gentleman discusses this important subject:

Butter cannot be preserved by any covering. Its inherent quality alone can do this. Butter is not permeable by the air. If it is solidly packed in an air-proof receptacle, necessarily only the top of it can be affected by contact with the air. But there is always some impurity retained in butter after it is made, in spite of the most skillful treatment. By skilful management, this may be reduced to a minimum, but there will still be some of the buttermilk left in it. The best made butter exists in the form of small globules after churning, and it is possible to wash these in pure cold water so thoroughly that all traces of buttermilk may be got rid of completely; yet each of these globules is made up of smaller globules; so there are yet some minute particles of buttermilk unavoidably left in the butter which cannot be removed unless it is actually melted into oil, and then solidified again. This process is not admissible. Under the best conditions, the best-made butter may be kept six months in a dry, cool cellar, well ventilated, when it is packed in a perfectly pure, air-tight jar or tub, and this without addition to it of more than the due proportion of pure salt. Butter may improve in flavor—to some tasts—during this time of storage.

Some antiseptic entirely devoid of flavor, as saltpeter, may assist in keeping butter, but there is no necessity for its use. If, however, the maker has not the experience which gives confidence, the use of one-quarter ounce of it to the pound of butter will be a help in keeping it. This, and the salt, one ounce to the pound, together should be reduced to a fine powder and intimately mixed with the butter.

Of course the receptacle in which the butter is packed must be perfectly free from taint. It is the common practice in fine dairies where the surplus is packed in this way, to use white-oak pails of 50 pounds' capacity, made in the best manner, and varnished with copal, dissolved in alcohol, inside and out. The butter is packed solidly; and if not all at once, what is packed is covered with brine made with boiling water and strained, then cooled, and as each layer is packed it is sprinkled with salt or this mixture. When the pail is filled to within a quarter of an inch of the edge, this space is covered with a piece of muslin well washed in boiling water, and then dipped in cold brine, and spread over the butter, which has been lightly sprinkled with salt or the saltpeter mixture made very fine. The cloth should extend a full inch over the edge of the pail, which is then filled up with the finest dairy salt, this of course is used all through the work, and the edges of the cloth are turned down over this salt.

The salt is pressed firmly down into the edge of the pail, the cover is put on, and this is pressed down as tightly as possible by a lever, until it meets the edge of the pail. Then the clips by which it is held down are fastened. Some buttermakers are so particular as to use a gasket of thin cork, or canton-flannel doubled, and soaked in brine, around the edge of the pail, to secure the butter still further from contact with air. The pail so packed is kept in a cool, well-aired place, free from odors: a place especially provided for it is best, and a label should be attached, with the number the date of the package. One may then guarantee the condition of the butter to be equal to fresh-made at the end of six months, and to all but those consumers who prefer flavorless and odorless butter, the well-ripened, aromatic article will be perfectly satisfactory.

Grade up the Herd.

The common cow is not good enough, but she furnishes the best obtainable foundation upon which to bdild a herd of greater efficiency. The farmer who is really interested in increasing his profit must undertake a process of selection. There is a wide difference in value between the best and the poorest cow in his herd. He must learn to know the good cows and retain for future usefulness the heifer calves from these cows. The poorest cows should be sold and in many instances the money derived from such sale could to most excellent advantage be used in building a stable for the remaining cows. The best of the common cows should be bred to a good Holstein bull, according to my idea. I think the grade Holstein is the best farmers' cow in this country. There are farmers, however, who are so prejudiced against the Holstein that they would quit the dairy business or refuse to enter it, if they thought it necessary to introduce Holstein or other dairy blood into their herds. Dairy blood is the best but not absolutely necessary to obtain a reasonable degree of profit from the dairy. I certainly would not use a bull whose ancestors have been bred for beef or a bull which may himself have been reared by a nurse cow. It is impossible to get milk by such breeding. I would use in preference a bull calf from my heaviest milk-producing cow. I would then know at least that his mother was a milk producer. Life is too short for a farmer to undertake to flesh out and milk out the beef quality which breeders have bred into their stock and which is as firmly rooted as the Rock of Ages. The quickest and most effective plan of grading up for the dairy is with dairy blood. The sacrifice from a beef standpoint will not be so great as at first it may appear. The more butterfat a man gets the less value beef is to him.—T. A. Borman, in Kimball's Dairy Farmer.

Poor Milk.

There is no article of food so generally used from the cradle to the grave as milk. In this we are all agreed that it may be good, bad or indifferent, and the neagre intelligence, or shall we say instinct, of the infant is equal to the task of differentiating one quality of milk from another. But the children of a larger growth are generally ignorant of the conditions which enter into one phase of the production of inferior milk.

What I refer to is the common mistake in believing that the quality of milk is determined largely by the nature of the food that the cow eats.

Look Him Right In The Eye

Two sorts of agents claim that disk filled or other complicated, hard to wash, out-of-date cream separators are modern and easy to clean.

One sort knows better but hopes you don't, because he wants to sell you that kind of machine. Look that fellow right in the eye—tell him you do know better, and that he can't fool you. The other sort of agent is simply mistaken—he does not know the facts. Tell him to look at a

Sharples Dairy Tubular Cream Separator

Tell him it has neither disks nor other contraptions, yet produces twice the skimming force, skims faster, skims twice as clean and washes several times easier than common separators. Wears a lifetime.

The World's Best. The manufacture of Tubulars is one of Canada's leading industries. Sales easily exceed most, if not all, others combined. Probably replace more common separators than any one maker of such machines sells.

Calves Raise Them Without Milk
Booklet Free
A. A Archibald & Co, Truro, N. S.

One of the stock arguments used against the feeding of brewers' malt to dairy cows was that it produces a poor quality of milk. The same argument has been used in the case of beef pulp, this is a mistake. Each cow is a physiological unit in the production of milk constituents, when in a healthy condition. The quantity of milk varies greatly according to the kind and amount of feed consumed, but the quality remains uniform with remarkable persistency. W

If the cow is sick or starved and the body functions abnormal, then it may be different. It is a fact of much interest, as well as of economic importance, that the cow under all sorts of adverse conditions will persistently adhere to her standard in the relative proportion of milk constituents.

The flavor of milk will vary according to the feed and other things. The milk may be read or blue in color, and the cream may be ropy; it may sour quickly and many things may happen to it because of the presence of bacteria—when cans and bottles are not sterlized, and the milker is careless; but the same amount of cream, casein, milk sugar and other constituents are there, quart for quart, providing the cow is healthy and the milkman has not skimmed it down to three per cent—or more.

There is a great difference in the quality of milk in individual cows, as well as in breeds. Samples of milk from a certain cow were brought to the veterinary department of the Colorado Agricultural College for analysis. The complaint was that there was no cream on the milk. Analysis of each sample revealed about two per cent butter-fat. The cow has been examined and found healthy. The feed has been changed, but the milk remains poor. She is that kind of a cow.—Geo. H. Glover, Colorado Agricultural College, Fort Collins.

Difference Between Buttermilk and Whey.

The solid matter in whey usually amounts to between six and seven per cent. This solid matter consists of about 5 p. c. milk sugar, .3 p. c. fat, 5 p. c. ash and .8 p. c. albumen. This is "what will be left when the water is all boiled out of the whey."

The difference between whey and buttermilk is principally in the proportion of casein in the two products Buttermilk contains about 4 p.c. casein while in whey there is a little less than 1 p.c., albumen which is the same kind of a product as casein. There is also about 1 p.c., less milk sugar in buttermilk than in whey. The two products contain about the same kind of constituents but they differ in the proportion of these constituents.

Buttermilk is worth at the present time at least thirty cents per hundred for feeding pigs and if tons of it are being wasted at the factory you patronize, an effort should be made at once to save this enormous waste. Buttermilk has the same stock feeding value as skimmilk but it may be converted into a human food product by making buttermilk cheese which is described in a bulletin of the Wisconsin Experiment Station. If a market can be found for this product the buttermilk can be sold for approximately $1.00 per hundred pounds.

Variation of Casein in Milk.

As a rule the per cent of casein in milk is more uniform than is the per cent of fat. But tests made during the past few years have shown that there is a considerable variation in the casein content of the milk of some cows. It varies as much as 1 per cent; that is from 2-8 p.c. to 3-8 p.c. But as a rule the variation in casein contents is considerably less than this. I do not know that this variation is a characteristic of any particular breed of dairy cattle. It is more a peculiarity of a single cow than a breed characteristic. Ib

The average amount of cheese that is made under satisfactoty conditions from 100 pounds of milk testing 3½ p.c., fat is about 9.1 pounds and from milk testing 4½ p.c. fat about 11.7 pounds.

E. H. FARRINGTON.
Wisconsin Dairy School.

Too Hot to Work.

Editor The Maritime Farmer :—

Some of the old members of cow testing associations appreciate the system very much, and are realizing a profit by it. In the Shearer, Ont., Association, for instance, one man stated that he has delivered to the factory almost as much milk from ten cows as he did two years ago from fourteen cows. He has sold one of the ten for $45.00 for beef. At her best she gave 31 lbs of milk per day; she is replaced by a cow costing $50.00, now giving 41 lbs. of milk per day.

This statement shows the immense saving of labour that can be effected by keeping cows selected on their records. It is too hot weather to work round and bother with four unnecessary cows if the smaller herd, as indicated above, brings as good return. If it pays to milk a cow it pays to milk a good one. The herd needs pruning of the dead, unprofitable wood. Dairy records of individual cows show conclusively which to lop off. Blank forms are supplied free of charge on application to the Dairy Commissioner, Ottawa.

The Magnet Cream Separator

is **entirely different** in its **construction** and is **better** than any other cream separator.

It is built

MECHANICALLY CORRECT.

The MAGNET Skimming Perfectly sitting on the rough PRAIRIE
THE SQUARE GEAR AND DOUBLE SUPPORTED BOWL DOES IT STEADY AS A ROCK

MECHANICALLY CORRECT means putting the power on the machine by properly **graded steps** or gears. When you see a very **large wheel** turning a **very small one,** it is a **violation** of **mechanical rules** and means wear, breakage and **trouble,** but is done to **save the cost** of the extra wheels of steps. The **Canadians** who originated the **MAGNET** were **educated mechanics** and could **not** be induced to apply the make shift, worm gear drive, adopted by makers who preferred cheapness in construction to durability. Use has shown that the worm gear drive soon wears, the bowl wobbles and then considerable butter fat goes into the skim milk at each separation. The square gear does **not wear** and the **MAGNET** skims as closely after twelve years' use as the first day it skimmed.

Do not take our say so, examine for yourself.

Take the **MAGNET** stand, it is **solid, strong** and **rigid,** constructed to **hold the gears without vibration** or **possibility of accident to anyone.**

Square gear drive is used, the only drive approved of for a **fast running** machine like a cream separator.

The shape of the **MAGNET** bowl is **different** from others, being **longer,** enabling the insertion of the famous **one piece skimmer,** so constructed as to take out all the butter fat but a trace, at the same time **draws** out all **dirt and foreign matter** and holds the same to be washed off. This skimmer delivers **pure cream.**

Bronze bearings are used on the **MAGNET,** because being harder than steel they do not wear out.

Glass hard steel balls, extra large size, are used, will not wear or break.

The brake (**MAGNET PATENT**) circles the bowl, stops the machine in eight seconds, does not injure it.

The bowl is supported at both ends and cannot wobble or get out of balance (**MAGNET PATENT.**) All other separator bowls are run on one end, the vibration of which leaves butter fat in the skim milk.

Every point in the **MAGNET** is a strong point, no weak spots.

A cent postal card will give you a full demonstration of the **MAGNET** in your own dairy. No obligation to buy.

THE PETRIE MFG. CO., LIMITED,
Vancouver, Calgary, Winnipeg, Hamilton, Montreal, St. John.

Making Cottage Cheese.

Making cottage cheese is a comparatively easy process. The skimmilk is allowed to stand in the vat until it sours, or it may be coagulated by adding a little hydrochloric acid. After curdling, the whey is drawn off and the curd collected on a cheese cloth strainer. The strainer is usually made of linen. It is slipped over a wooden frame, the ends of which are supported on wooden horses which are set over the drain. The curd is stirred in this strainer to free it from the excessive whey.

The flavor and texture of cottage cheese may be improved by adding cream or soft butter to the curd on the strainer. Sometimes dry sage or caraway seed is also stirred into it in order to give the cheese a special flavor. It is salted to suit the taste —about two pounds of salt per thousand pounds of milk.

The following process has been found to give satisfactory results: Set the skimmilk at 70 degrees F. until it coagulates; cut the curd fine with a curd knife then heat to 90 degrees for 30 minutes in the whey. At this point draw off the whey and transfer the curd to the strainer described above.

I think you will have no difficulty in making this cheese and the quality of it will depend a great deal on the length of time it is heated in the whey and whether or not you can afford to mix a certain amount of butter or cream with the cheese after it is made. You can calculate from the cost of the skimmilk and the amount of time required to make the cheese about the price at which it should be sold.—E. H. Farrington, Wisconsin Dairy School.

LIVE STOCK.

The Breeding Ewe.

The breeding ewes should not be permitted to run down in flesh during the suckling period. Where farm flocks are kept this may be remedied easily by removing all ewes from the general flock that seem to be on the decline. There is always some reason for this condition which the intelligent experienced sheepman will readily detect when investigation is made. Old ewes are always subject to decline, because their teeth, or lack of teeth, injure their chances in grazing and they are incapacitated to carry on the functions of mother in the feeding of a big, strong lamb and maintain their own vigor and strength. Such ewes need a little extra feed and care.

The ewe and lamb flock should be kept separate from the other sheep, unless the total numbers are small, in which case they may all run in the same pasture. It is always preferable that the flock has access to salt at all times. This should be kept in a box under cover in order that it be free from rain or moisture. Water is very important for both ewe and lamb and should be provided by running stream or pumped in clean tank or troughs kept free from mud or filth. Slough or surface water taken from mud holes is often the cause of disease, especially with the lambs.

The lambs should be taught to eat ground feed before weaned, and weaned when 4½ to 5 months' old. As soon as weaned the lamb flock should be put on fresh grass where there has not been sheep during the summer. The ideal place is on a meadow where the aftermath has grown up. Clover pastures are excellent for the newly weaned lambs.

The Growing Pig.

The feeder can learn much from close observation of the animals under his care, noting their likes and dislikes and the suitability of foods at different ages. In pig feeding the best opportunities are offered for studying results since they respond readily to good rations and comfortable quarters.

Prof. Dietrich, of Illinois, has pointed out the good influence of exercise in maintaining the health of the growing pig. For the most economical production of pork it is necessary to give the young pig an abundance of exercise to keep its digestive system in order.

The market benefit derived from pasturage is attributed to the fact that in grazing the pigs get the needed exercise which stimulates the functions of respiration, digestion and metabolism, thus enabling them to utilize larger quantities of feed to better advantage. That is, they will make larger and more economical gains from a given quantity of feed, grain and pasture combined when they have exercise than when they have no exercise.

In order to get best results it is undoubtedly necessary, as shown by experimental data, to feed the right quantity of water as well as the right quantity of the other nutrients and another one of the principal reasons that winter feeding of pigs has not been more successful is because an insufficient amount of water was used. During the winter season in cold climates where the pig is given dry feed and free access to water he will apparently not drink enough for maximum and most economical production.

It was determined in experiments conducted by Prof. Dietrich that the water requirements of a pig begins with twelve pounds daily per 100 pounds of live weight for hogs two months old and falls gradually to four pounds daily for pigs eight months old and in prime condition for market.

In general all the water is given with the feeds in the form of a slop, but a limited amount of recent data seem to show that, in so far as the water is concerned in itself, it makes some difference as to how it is fed, as well as the use of the right quantity. The best results have been obtained by feeding the bulk of the water after the rest of the feed has been eaten, using enough water to wet the dry feeds and enough feed in the water to mave it palatable. During the hottest weather, however, it seems to be necessary to add a little more water to the dry feed. But the manner in which the water is used in a ration may exert considerable influence in other directions, as, for instance, the distribution of the other nutrients, the amount of exercise the pigs get, etc.

By giving the pigs dry feed or a thick slop and then free access to water they did not do as well as in cases where the above specified quantity of water was mixed with all the dry feeds in the form of a slop. The former method, however, produced better results in summer than in winter, but was also comparatively ineffective during the hot weather. This indicates that in winter the pig will not drink enough and that during the hot weather of summer he will drink too much when he is given free access to water.

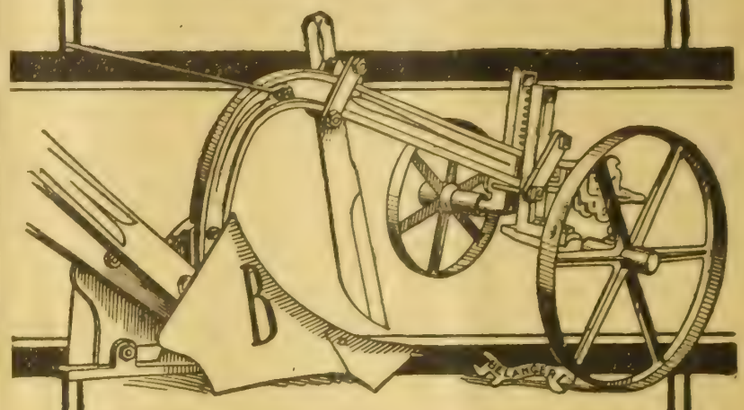
Swine for Breeding.

There are many buyers looking for show yard winners and the young breeder who is building up a herd will often be compelled to pay more money for a show winner, than an equally good animal would cost him if purchased in his normal condition. Show yard honors have value, but there are many winners that never prove valuable breeders when put to the test in a herd. It is seldom profitable to invest a large amount of money in a high priced breeding boar until there are a number of choice sows to mate with him.

The character of the herd will depend precisely upon the quality of each and every animal selected for breeding purposes. The boar should be an excellent individual ideal in form, size, color, markings and possess finish and quality. He should have a sprightly, elastic step and a graceful carriage. He should be able to look you square in the eye and have a kind and intelligent face, eye and head. A fine, silky coat, smooth sides and be free from wrinkles. He should have a strong, broad and, well arched back; shoulders wide, deep and broad on top, compact, smooth and well down on arm; loins full and smooth; chest large and roomy; rump long, broad and well rounded, and tail well set up, tapering and curled; ribs well sprung from the back, and chest roomy and large; hams long, deep and thick and well rounded from points down to the hocks, sides long, straight, deep and free from wrinkles and flanks well set down; legs short, set at each corner and standing erect, front legs should stand straight and be muscled down on arms; hind legs strong and hocks well set, and short and firm pastern; feet tough and erect toes. Added to all of these requirements he should come from a line of ancestry possessing the same qualities.

In selecting sows for the foundation herd it will be best to buy them from one herd that has been established for many years, until the animals bear a striking uniformity to each other, and the blood lines have become thoroughly established. This enables him to take up the work where the man who bred them left off and continue the work of improvement, instead of buying a miscellaneously bred bunch of sows that possess no fixed type. The sows had best be selected from some estab-

YOU DON'T NEED A SULKY PLOW—GET THIS TRUCK.



THIS truck under the beam makes an ordinary plow as solid as a sulky—takes the strain off the plowman's arms—makes it almost unnecessary to hold the handles—keeps the plow working at an even depth—makes the draught easier and more regular on the horses—makes it possible for a boy to plow as well as a man could. Anyone can put this truck on ANY plow in 5 minutes—you don't need to have one of our celebrated "B" plows to work it. The large 18-inch wheel runs in the furrow, regulating the furrow thickness and width; the small 12-inch wheel supports the plow when the plowing is too deep and the plow has a tendency to overthrow. Remember, $5.00 will put this truck on YOUR plow—isn't that cheaper than a sulky? What's more, that price includes free delivery anywhere in Ontario, Quebec or the Maritime Provinces. Lost Five Children With DIARRHOEA

Saved the Sixth One With DR. FOWLER'S Extract of Wild Strawberry.

Mrs. John Firth, Craighurst, Ont., writes:—"I have had six children and lost them all but one. When young they would get Diarrhœa and nothing would stop it.

As I lived in a backward place, I did not know of Dr. Fowler's Extract of Wild Strawberry.

I saved my last child, who is now eight years old, but I owe it to Dr. Fowler's Extract of Wild Strawberry. Had I known about it before I feel that I would have saved the others. I shall forever praise and bless it and will never be without it again."

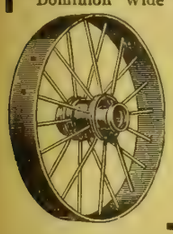
"Dr. Fowler's" has been on the market for over sixty-five years, and has a "world wide" reputation for curing all Bowel Complaints.

Do not be imposed upon by any unscrupulous dealer who wishes to substitute the so-called Strawberry Compounds for "Dr. Fowler's." Price 35 cents. Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

You Need These.

for heavy farm work. Dominion Wagons are light and strong. Save horses, save money. Light draft Best for rocky or muddy roads. Loaded half time of high wagons. Make one man's work equal two. Change to platform pattern in a jiffy, with ease.

Dominion Wide Tire Low Steel Wheels outwear 3 wooden ones. Cost less. Save ½ repair bills. No resetting tires. Fit any axle; built strong for roughest work. Won't break from cold or jolts. Write now for free catalogue.



Dominion Wrought Iron Wheel Co., Ltd., Orillia, Ont.

PILES CURED at HOME by New Absorption Method

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309, Windsor, Ont.

Read every add in this issue. They will interest you.

lished herd by visiting the breeder and selecting them in their normal condition. They should resemble the boar and be bred along similar lines. The special points to be observed in selecting the sows are size, quality and finish.

Good, strong backs are of supreme importance. Weak backs should be shunned. The sow's face should be smooth and broad between the eyes, and gradually taper towards the end of her nose. She should have straight side lines, smooth shoulders, and possess symmetry and style, have a kind disposition and be an easy feeder and prolific.

It is a mistake to order foundation stock by mail, and order a few sows and a boar not akin. The chances are that right at the very beginning you will introduce a violent outcross and spoil the results years of systematic selection and mating to hold and keep in control a fixed type and prepotency. Fixed characteristics cannot be established and perpetuated by bringing together unrelated families of the breed.

What Western Sheep Breeders Will Do.

At the meeting of the Sheep and Breeders' Association of Manitoba, held June 1st, it was decided to hold three auction sales the coming Fall of grade sheep; one at Brandon, October 18th; one at Portage la Prairie, October 20th, and one at Winnipeg, October 22nd.

As sheep for this sale will be purchased by the Association, and will be limited to yearlings and two-year-old ewes, to be sold in lots of six, it will no doubt be the means of assisting in popularizing the breeding of sheep in Manitoba and eventually help to clean up some of the farms that require something of this kind. The Association will make the purchase of this consignment from some of the ranges in Alberta, as they consider that these sheep will be more suitable for Manitoba than eastern bred sheep.

The announcement some weeks ago regarding the proposed importation of breeding sheep has induced several persons interested in sheep breeding to write to the secretary of the Saskatchewan Sheep Breeders' Association, F. Hedley Auld, Regina, telling what they require.

The movement has aroused considerable interest in the question of sheep breeding. Some are of the opinion that in the sales of sheep that it is proposed to hold only grade ewes should be offered. Others would like to see only purebreds put in the sale. Certainly purebred stock is preferable if the farmers are prepared to pay the price, but as grade ewes can be bought on the ranges in Southwestern Saskatchewan at much less than the prices of purebreds it would seem to be a better plan to begin with grades, and afterwards improve the flock by the use of purebred rams of the breeds most suitable to the West.

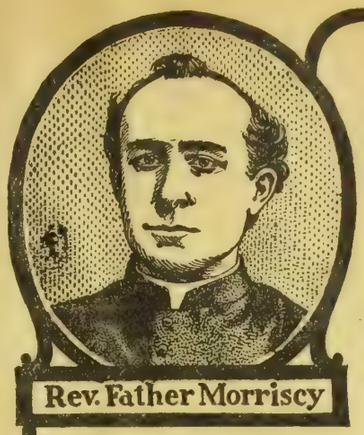
Owners of purebred sheep are being communicated with in order to ascertain what stock they have for sale. This information will be used in preparing a directory of breeders of purebred sheep in Saskatchewan, and will be useful to any person wishing to buy sheep privately.

The Ox Warble.

The ox warble is the larval or worm stage of a fly known by various names, such as the heel fly, striped hypoderma, grub or warble fly, etc.

This fly is found most abundant in the Southern States, while in the extreme Northern States very few or none are found. This fly has four stages; the egg, or ova, the larval, or worm, the cocoon, or pupal, and the adult, or fly. It was thought by early writers that the fly layed the eggs in the skin of the back of cattle This idea has long ago been proved to be wrong by Dr. Cooper Curtice. The writer has been able to confirm Doctor Curtice's story of the history of the various stages of this parasite, which is as follows: The fly lays the eggs, cementing them to the hair in the region of the heel of cattle, where, perhaps by the crawling of the minute larva, or worms, over the skin causes the animal to lick the part and thus gets the larva into the mouth. They now become lodged in the mucous membrance (lining) of the oesophagus anh here pass a part of their worm stage. The part in which they are imbedded is not inflamed and no serious injury is produced at this point. The worm at this stage can be found in this locality during the summer months. At this point they never reach a size greater than about a half inch in length and three-sixteenths in diameter. After passing this part of the life, they leave the oesophagus and find their way between the muscles; through the loose connective tissue, and become lodged under the skin in the region of the withers and down the spinal column. The question has often been asked: "Why do they lodge here?" I will answer that by asking: "Why a lung worm upon being swallowed and reaching the stomach finds its way to the lungs and will not develop in any other part of the body?" These tumors in the region of the back grow as the worm grows. At the summit of each tumor will be found a hole, which also grows as the tumor enlarges. In April and May, depending upon the latitude, they are fully developed and leave the tumor. This they are enabled to do from the fact that they are soft and contractile. It has been observed that most of them leave the tumors in the morning. They now burrow in the ground and form around them a cocoon in which they pass through the stage which brings them to the adult, or fly stage again. The length of time they are parasite in the animal is about ten months. The length of time in the ground, from four to six weeks, and the length of the life of the fly from two to four weeks, making the entire life history about twelve months

The warble in the back does not cause a great deal of injury to the host. Some irritation is at times manifested. The warble can be easily squeezed out by gentle pressure at the base of the tumor. The injury to the hide industry, in the cattle slaughtered that are "grubby", is considerable. Everywhere there is a tumor there is a hole, and when the hide is tanned, a larger hole results.—B. F. Kaupp, Colorado Agricultural College, Fort Collins.



Rev. Father Morriscy

Why Not Get Rid of That Catarrh?

There are few people in this extreme and changeable climate who have not at least a touch of nasal catarrh.

Yet because in itself it is not very dangerous most people put up with it, in its first stages, as a matter of course, till some day they wake up to the fact that the trouble has crept down to the lungs, or perhaps, through swallowing the phlegm, to the stomach.

Besides being dangerous in this way, catarrh is most disagreeable to oneself and others.

Father Morriscy's No. 26

is a combined internal and external treatment that has cured, and will cure, the most stubborn cases.

The tablets, taken three or four times a day, purify the blood and help to throw off the disease, while the antiseptic, healing salve, applied up the nostrils, cleanses the diseased parts, heals, and completes the cure.

Now is the very best time to get No. 26 and start to get rid of that catarrh.

Combined treatment 50c. at your dealer's. 110

Father Morriscy Medicine Co., Ltd., - Chatham, N.B.

Summer Water Supply

During the hot summer months, more than usual care should be exercised in regard to the water supply in the pastures. Insufficient or impure water for a few days will affect the herd injuriously, to almost the same extent as would exposure to the most severe blizzard of winter. This is noticeable not only in the quality and quantity of the milk, but also in the general conditions of the animals.

Be sure and take a bottle of Chamberlain's Colic, Cholera and Diarrhoea Remedy with you when starting on your trip this summer. It cannot be obtained on board the trains or steamers. Changes of water and climate often cause sudden attacks of diarrhoea, and it is best to be prepared. Sold by all dealers.

Kendall's Spavin Cure

The cure that saves horsemen and farmers millions of dollars every year.

It is known the world over as the one certain, reliable remedy for Spavin, Curb, Splint, Ringbone, Bony Growths and any Lameness.

Cases just developing and old, stubborn sores and swellings readily yield to the wonderful curative powers of this famous remedy.

Orangeville, Ont., Dec. 21, '08

"We had a horse which was getting very lame on account of a Spavin. I was anxious about him as we could not work the beast when we most needed him.

Our teamster saw Kendall's Spavin Cure in the store and tried it.

I am pleased to say he had success as the horse has stopped limping and is doing his day's work."

W. A. NICHOLSON.

Don't worry about Spavins, Growths, Swellings or Lameness, but use Kendall's Spavin Cure. It cures every time. The world's best liniment for man and beast.

THE HORSE.

How to Pick a Brood Mare.

In selecting a brood mare, the character, symmetry, style, constitution, soundness and type are of even greater importance than pedigree. It is well to have a type of perfection in one's eye and to get as near that as possible.

It is a matter of controversy which is the most important of all these points; some breeders seem to lay more stress on having one point right, and some another. We remember one successful old breeder who would sacrifice almost any other point to have feet and fetlocks right.

In a brood mare a strong, healthy constitution is of the utmost importance. The long, low, wide sort, with well sprung ribs and plenty of middle, room to carry a good dinner bag, wide in chest, and thick through the heart, affording ample room for heart and lungs, plenty of width in hips and thighs, also essential in a brood mare, are some of the main points which indicate a good constitution.

The feet and legs are most important points, and it is well to begin our examination there. The feet must be strong round the coronet—of course, free from ring bone, side bone, sand crack, thrush, corns or canker—wide at the heels, hard in the hoof, and a wide open concave sole; set true and straight under her; pigeon-toed or splay-footed mares are very objectionable. The fetlocks should be nicely slopped, and of medium length; if too long there is a tendency to weakness, and if too short the action is stiff and wanting in spring. Very upright pasterns are objectionable, as they do not stand the wear and tear of the hard road, and very flat, low-set fetlocks are wanting in strength when hard-pulling is required. The bone under the knee should be dense in character, flat in form, and as big as it can be got, although size of bone is perhaps not so important in the mare as in the stallion. The knee should be prominent, big and strong, not set back at all; the hock of great width when looking broadside at the mare, and clean and narrow when taking a hind view, also set well together. Hocks set wide apart should be avoided. The muscle of the forearm and thighs should be strong and well developed.

A correct curve of the hind leg is an important point. Cowhocks are always weak at a pull, and very straight hocks are apt to develop spavins. The feather should be long and silky, free from hardness or curling.

The head and eyes should betoken docility, intelligence and courage. It is only by observation that anyone can acquire the art of recognising character in a mare. No amount of descriptive writing can teach one how to judge these characteristics in horse or in man. The loin, of course, should be strong, and the tail set well up, in line with the back, not drooping. Such is a brief description of the style of animal to have in one's eye and to aim to get as near it as can be, but, of course, bearing in mind that there is no such thing as a perfect horse. As for size, a mare standing 16 hands high and built in proportion is big enough. Color may be selected according to taste, but a brown or bay-colored animal is always more saleable than a black or any of the lighter colors.

Distemper in Horses.

Distemper, or strangles, is a disease principally affecting young horses. It is due to a germ belonging to the streptococcic group. The disease is accompanied by high fever, catarrhal inflammation of the mucous membranes, especially of the nasal passages, and as a result of this condition a discharge from the nose. There is a swelling of the lymph glands under the jaw, which later results in abscess formation.

A horse with distemper can communicate it to a healthy one.

The germs are found in the discharge from the nostrils and in the puss from the abscess which forms under the jaw and later breaks.

The majority of cases of distemper occurs before the age of 5 years.

The constitutional disturbances caused by the shedding of the teeth, and cutting same, as well as impure air in poorly ventilated stables, over worked and poorly fed animals are factors that weaken the resistance and make infection possible to produce the disease.

The disease is more common in the spring and fall of the year, particularly the former, on account of the chill received at these seasons of the year.

The disease can also be transmitted from dam to offspring through the milk.

The animal usually developes the disease in from three days to three weeks after being exposed to the contagion.

Animals affected with distemper should not be sold. Young animals should not be brought in contact with those affected, nor watered out of the same bucket, nor come in contact with any other property until it has been thoroughly disinfected. An animal should not be castrated while suffering with strangles.

A vaccine made from the specific germ causing this disease is prepared in the laboratory of the veterinary department of the Colorado Agricultural college.

This vaccine is very useful in combatting distemper, both as a preventive and as a cure, and promises to be of as great value as the anti-suppuration vaccine made in the same laboratory from the germs which cause poll evil, fistula and wound infections.

Like the anti-suppuration vaccine, to get the best results it must be by one who is trained in the diseases of the lower animals and understands the use of vaccines on same. It is, therefore, advisable to have it used by a competent graduate veterinarian.

Proper Lubrication

For gasolene and kerosene engines

Standard Gas Engine Oil

Is the only oil you need. It provides perfect lubrication under high temperatures without appreciable carbon deposits on rings or cylinders, and is equally good for the external bearings.

Steam Traction Engines and Steam Plants

Capitol Cylinder Oil delivers more power, and makes the engine run better and longer with less wear and tear, because its friction-reducing properties are exactly fitted to the requirements of steam traction engines and steam plants.

Traction Engines, Wagons, Etc.

Mica Axle Grease makes the wheel as nearly frictionless as possible and reduces the wear on axle and box. It ends axle troubles, saves energy in the horse, and when used on axles of traction engines economizes fuel and power.

Plows, Harrows, Drills

Granite Harvester Oil insures better work from the new machine and lengthens the life of the old. Wherever bearings are loose or boxes worn it takes up the play and acts like a cushion. Changes of weather do not affect it.

Every dealer everywhere. If not at yours, write for descriptive circulars to

The Imperial Oil Company, Limited

Wean The Colt Now.

Forest Henry, one of the Farmers' Institute workers in Minnesota, and a successful farmer, says that his experience teaches that the time to wean the colt, even if not more than 3 months' old, is before going into the harvest field with the mare. He teaches his colts to drink skim milk and to eat oats with the mare before weaning. But in feeding skim milk caution is used on Mr. Henry's farm at first, and the amount of milk is limited to two or three quarts a day. After a few days the amount is increased at each feeding time. Oats and wheat bran are fed the colts quite freely. Second crop clover, free from mold, is excellent hay for the colts. Provide plenty of exercise with access to shelter. Darkening the stall during fly time through the day and turning the colts out at night is a good plan to follow. When the flies are gone and cold weather approaches reverse the scheme by sheltering at night and giving exercise through the day.

Hay for the Horse.

The agricultural authorities both of North Dakota and of the Minnesota Experiment stations agree that a pound of hay per day per hundred pounds of weight of the horse to which it is fed is sufficient. Over feeding of hay results frequently in heaves and indigestion. It is advised to limit the amount of hay a work horse is given to avoid serious results consequent upon working on too full a stomach. Colts, however, may be fed all the hay they will eat. —University Farm Press News.

POULTRY.

Prevention and Destruction of Poultry Parasites.

FLEAS.

Fleas are only found where dirt prevails, as in dark, unclean, and badly ventilated houses. They spend the day beneath the straw or rubbish in the nests, in crevices of the walls, or beneath any convenient shelter. At night they make their way to the fowl to obtain nourishment.

The adult flea is small, dark brown in color, and very active. The female lays her eggs in any of the places where fleas are to be found during the day, or even in refuse or manure that may be on the floor.

Fleas have sharp piercing jaws by means of which they bore into the flesh and draw the blood upon which they live. The strength of birds infested with fleas is consid?rably reduced through this loss of blood. Severe irritation of the skin is also produced. In the case of chickens fleas cause stunted growth, if not actual death from weakness. Sitting hens frequently are compelled to forsake their nests on account of the intense irritation produced by the persistent attack of fleas.

MITES.

Mites are quite distinct from fleas or lice and are much smaller.

There are numerous species of mites, but the red mite is the most troublesome, and is the only one to which reference will be made in this article.

This mite varies in color from pale yellow to dark red; it multiplies with exceeding rapidity, and not only poultry, but horses, cattle, and goats are liable to its attacks. For this reason, fowls should not be kept in stables along with other farm animals, but in a poultry-house which can be kept scrupulously clean.

During the day the mites shelter in convenient crevices in the walls, nests, floor, and particularly on the underside of the perches when they are rough or covered with bark.

Mites have piercing and sucking mouths, by means of which they penetrate the skin of their host and fill themselves with blood. Birds are chiefly attacked at night when perching or sitting on the nests.

Mites injuriously affect fowls in the same manner as do fleas. They prey upon their host chiefly at night time, and therefore the remedial and preventive measures to be adopted against both are practically identical.

PREVENTION AND DESTRUCTION OF FLEAS AND MITES.

Unless fowls are housed satisfactorily, it is useless to attempt to keep them free from vermin, and it must be remembered that the presence of insect parasites means loss. The loss may not at first be evident but in the end profits are sure to be reduced. The house, therefore, must be kept clean, and should be well lighted and ventilated.

The following rules, which are simple and inexpensive to practise, should be strictly enforced:—

1. Keep the poultry house quite clean, and provide for lighting and ventilating if arrangements for such do not already exist.

2. Thoroughly limewash the walls and all the fixtures of the house at least three times a year. A small quantity of soft soap thoroughly mixed into the liquid renders it more adhesive. A thin wash will penetrate into the cracks and crevices, and if a little paraffin oil has been added it becomes much more effective.

3. The perches should be planed quite smooth, and on no account should branches of trees which are covered with bark be used. The perches should be erected so as to be readily movable, and the sockets into which they fit should frequently be soaked with paraffin. When the house is being lime-washed the perches should also be treated.

4. Clean out the poultry-house daily and scatter powdered lime over the floor and perches. That is, perhaps, the most important point to be observed in combating the ravages of parasites and disease.

5. The nests should under no circumstances be permanently fixed, but should be readily movable. Cheap structures, such as empty orange boxes, are very suitable. These, when they become dirty, can be removed and burnt, and new boxes supplied. Powdered lime should be scattered around and beneath the nests, and no refuse of any description allowed to accumulate.

6. The materials in the nest boxes should be removed weekly and destroyed. Wood shavings are preferable to hay or straw.

7. As already indicated, poultry should be provided with a separate house, and not allowed to roost in stables.

BIRD LICE.

There are at least eight distinct species of lice occuring on fowls. In color they are usually dull white, pale yellow, or brown, and in size they vary from one-sixth to one-third of an inch in length. On affected fowls these parasites can readily be seen by turning back the feathers; they are most commonly found on the neck, beneath the wings, between the legs, and particularly around the tail.

Lice have biting and chewing jaws. They feed upon the products of the skin, barbs, and parts of the feathers. It might be supposed that as these insects do not live upon the blood of their hosts serious injury would not arise, but such is not the case.

Lice cause loss in several ways, chiefly through biting the skin and setting up severe irritation. Thus annoyed, the fowls become unthrifty. They cannot rest either during the night or day, and weakness and debility are the result. Laying hens lose their healthy appearance as the lice multiply, and their yield of eggs steadily diminishes. The irritation is particularly bad in the case of setting hens, and, as when attacked by fleas, they are eventually driven from the nest, and eggs are lost.

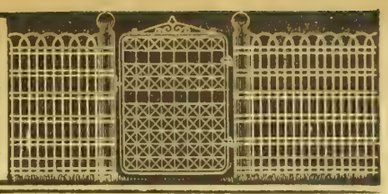
Yodng chickens brooded under hens infested with lice soon become similarly attacked, and are injuriously affected by parasites. This is evident from their unthrifty appearance, stunted growth, undue susceptibility to disease, and, not infrequently, from death through general debility. The head and throat of chickens are the parts most commonly affected.

Lice may be spread in various ways, the chief source of infestation being the introduction amongst clean fowls of infested specimens, especially male birds. During copulation the lice readi,y spread to the hens. Unclean nests are a potent factor in distributing lice from one hen to another.

Peerless Lawn Fence

Is Strong and Attractive. All the wires are uniformly crimped, large gauge, steel spring wire, heavily galvanized and coated with white enamel paint. Never sags, never rusts. Improve your property with a Peerless Fence. Cheap as wood and more handsome and durable. Also full line of farm and poultry fence and gates. Write for information.

THE BANWELL HOXIE WIRE FENCE CO., Ltd.
Dept. K, Hamilton, Ont., Winnipeg, Man.



PREVENTION AND DESTRUCTION OF LICE.

It is probable that if measures suggested for the destruction of fleas and mites were strictly complied with attacks from lice will be unknown.

The fowls should be kept perfectly clean, in suitable houses which are frequently lime washed; the perches should be smooth and movable, and the nests particularly should be kept clean, made easily movable, and destroyed after being in use for some time.

For fowls already infested with lice additional remedies must be adopted, viz:—

1. Dust baths should be provided for the adult poultry. If the fowls are at liberty they usually are able to find suitable places in which to dust themselves; but if they are kept confined, a box should be placed in the run and filled with road dust, dry sand, soil, or coal ashes. Fine dust is fatal to lice, and the drier the dust the more thoroughly can the fowls dust themselves. For this purpose the box should be placed under cover, and in a dry sunny part of the run.

2. Adult fowls should be thoroughly dressed with flowers of sulphur, or some effective insect powder such as Persian insect powder (Pyrethrum). This operation can best be performed by holding up the fowl by its legs and shaking the powder in amongst the feathers, which will open outwards. It is necessary that the powder should reach the skin of the bird; and the parts around about the tail between the legs, beneath the wings, and along the sides and back should be specially well dressed.

3. Adult fowls may be dressed with an ointment composed of one teaspoonful of flowers of sulphur and an ounce of lard, but on no account should this be applied to young chickens.

4. Young chickens hatched under hens should have a little pure lard rubbed on their heads and throats. This kills the lice by obstructing their breathing pores. After a few weeks a little lard might be rubbed in under the wings of the chickens.

5. It is very important that all nests should be kept clean and frequently dusted with lime or insect powder.

To sum up, fowls can never be free from insect parasites unless their houses, nests, and runs are kept perfectly clean. Overcrowding should be carefully avoided. Insect attacks lower the general vitality of the system and render fowls more liable to contract disease. A loss of vigor entails slower growth and reduces egg production, and consequently smaller profits. To obtain the best results it is essential, therefore, that unceasing attention should be paid to the prevention of the attacks of parasites.—Bulletin by Department of Agriculture for Ireland.

THE FARM HOME

This Department is now being edited by a very competent lady, who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

Aunt Tabitha's Fireside.

(Continued from last issue.)

"An address on edication, did you say?"

"Yes, don't you remember?"

"What was the schule-master's name?"

"Jeemes Crane. His father sent him to college, and he'd jest graderated, so the committee hired him to keep our schule."

"I remember Jeemes,', said Mrs. Dawkins. "When he fust came out of college, he thought he was the biggest man in the place, but, arter a while he found out his mistake."

"So do I remember him," said Aunt Tabitha. "Jacab means the time when Deacon Smalley's dog figured so largely, I s'pose."

"Yes," replied Mr. Dawkins, "that is the very time. The address was delivered in the new meetin'-'us."

"I remember all about it, now," said Aunt Tabitha. "Well, to begin at the beginning, I may as well mention that, so far back as that, the parish was kind of poor, and, arter gettin' the clapboards, and shingles, and nails, and glass, there wasn't anything left to get the wherewithal to put the pews into the meeting house, nor to build the singer-seats with, so the congregation was obliged to put up with seats made of a few boards propped up on blocks of wood, the fust year. We thought we did purty well to get a pulpit fixed out in decent shape, and fly round as brisk as bumble bees to do it, women folks and all. I can remember as well as ef 'twas no longer ago than yesterday, that Patty Pilsbury and I went to Sam Wallinford's store, over to Oak Village—Sam's was all the store there was within a dozen mile of here then—and bartered away two whole churnin's of butter, seven dozen of eggs, ten quarts of blueberries, and a bushel of wheat for enough green maroon to make a cutting dor the pulpit winder and the cushion to lay the Bible and psalm-book on.

"Well, Deacon Smalley and his wife, gin'rally speakin', used to go to meetin' in their shay, for they lived so fur off that they couldn't go home at noon if they walked. Now it so happened that one of their neighbors wanted to go a journey, and as he didn't own any shay, and wanted his darter to go with him, he went and asked the Deacon to lend him his. He forgot all about its bein' the day that Jeemes was to deliver his address, and I don't s'pose but what he would have lent it ef he hadn't, for the Deacon, and his wife, too, were turrible obleegin, sort of folks. Mr. Palmer, the man that borrowed the shay, hadn't got out of sight when they remembered that they should want it that day.

" 'Never mind,' said Miss Smalley, 'we can go afoot; that is, ef you think you can help, carry the baby.'

" 'I guess, ef I try, I can not only help, but carry him all the way.'

"David was the only child they had then, and, he was only about a year and a half old, Miss Smalley thought 'twas best to carry something for him to eat, so as to keep him quiet. As he lived mostly on milk, she put some in a tin dipper, 'cause she didn't like to carry an aitthen thing, for fear 'twould get broke, and crockeryware didn't grow on every bush, them days. When she got to the meeting house, she took a seat all by her self, close up to the pulpit, seein' she had a child to take keer on, and, throwin' a cloth over the dipper of milk, she sot it under the seat.

"Now the deacon had a little yaller dog—the dog's name was Watch—that al'ays follered him everywhere he went, on'y to meetin'. He didn't allow him to go there, and the dog knew it, but he was as cunnin' as a fox, and contrived to foller at such a distance as not to be found out, sometimes. Psalm-books and hymn-books were rather sca'ce articles in them days, and, besides the minister and deacon, I don't believe there was a single person in the meeting-house that owned one, except Patty Pilsbury and me; so, in the sca'city of books, arter the minister had read the hymn, the deacon al'ays had to line it for 'em to sing.

"As ill luck would have it, the man Deacon Smalley lent his shay to was the one that allays pitched the tune. 'Twas thought best to begin by singing, the same as the services were begun Sabba'day, or 'twouldn't 'ave been any matter. Well, arter the hymn was read, the Deacon give out the two fust lines. I don't remember what the fust line was, but part of the second was, 'And dig for golden ores.' Jeemes Crane picked the hymn out, 'cause, as he said, that diggin' for golden ores might, in a figurey sense, be s'posed to be the same as digging for science and all the highest kinds of learning, and, as the address was to be on edication, it would be kind of 'propriate.

"You know, Jacob, and so does Darcus, that Deacon Smalley wasn't the best reader in the world, and, as to that, it wasn't to be wondered at, for he never had any great chance to get learning of any kind. So, ginerally, he used to find out beforehand what hymns were going to be sung, so that he might have a chance to look them over; but that day he didn't find out in season. I could see in a minute that he was king of puzzled, for he kept turnin' his book so as to have the light strike fair on the page, and drawing his fingers over his forehead, as if he had some idee buried there, and he was tryin' to rake it out. Arter a while, he fetched a long breath, as ef his mind was relieved and then he cleared his throgt and begun. I wish I could remember the fust line, but I find I can't, so there's no use in trying. At any rate, instead of reading, 'And dig for golden ores,' he read, 'And dig with golden hoes.'

"Them that didn't have any books thought 'twas all right, I s'pose, but Patty Pilsbury, who sot next to me give my elbow a jog and says she jest loud enough for me to hear: 'I guess Smalley's mind is running on farmin' instead of edication, this morning partic'lar diggin', pertaters.'

"I had hard work to keep my countenance while the Deacon was waitin' for somebody to set the tune, but nobody sounded a note.

"Isn't there some person present says he, at last, 'that'll pick out a sootable tune for the occasion, and pitch it?' Not a single soul stirred or moved. You might 'ave s'posed that everybody had turned into so many statutes. 'Come, Miss Pilsbury,' said the Deacon, speaking to Patty, 'can't you strike somethin'? You know every tune in the singin'-book, besides a good many ranthems and the others will soon j'ine you, ef you on'y make a beginnin'.

"I don't know whether Patty would 'ave mustered courage enough to accept his invertation, or not, for jest as he'd done speakin', there was one of the queerest noises, and, at the same time, kind of doleful like, that ever assailed my ears, as Jeemes Crane said, when he was speaking about it afterwards. My fust thought was that somebody had ondertake to strike a tune, and getting kind of frightened like, had broke out into that terrible, doleful, distressed, and dismal noise, that sounded some thing between a howl and a whine. Old Miss Keeser, who was naterally narvous, was so skairt that she jumped right off her seat, threw her arms up, and screamed right out.

"But we soon found out what it was, for the Deacon's little yaller dog made his appearance, with his head squeezed so hard into the dipper of milk Miss Smalley had put under the seat that he couldn't for the life of him, get it out again, and so he went the whole length of the aisle, making that onairthly noise, and thumpin' the dipper on the floor every step he took.

"You know that Mr. Smalley was rayther young for a deacon, and so he thought that it behooved him to kinder stand on his dignity; so, instead of goin' and liberatin' the dog, as I knew he wanted to, he stood as stiff as a stake, put on a dreadful long face, and looked as grave and as stern as if he was a judge. At last, he couldn't bear it any longer, and says he: 'Won't some of the youngsters present pull the dipper off that dog's head, so that we can go forrard with the sarvices of the day?'

"With that, four or five boys that sot near the door sprung up, and one of 'em took Watch and carried him out of the meetin'-'us, and the rest follered arter. They made out to set the poor dog at liberty somehow, I never knowed exactly how. At any rate,, ever arterwards he took a great dislike to anything made of tin, partic'larly a tin dipper. Miss Smalley told me that she could never arter that make him eat or drink out of any kind of a tin vessel, and that he was as afraid of pewter or of anything shinin' as he was of tin.'

"Did you have to give up singing?" inquired Lizzie.

"No, indeed! Arter we'd got our faces straight and our narves kind of stilled down, Patty and I talked the matter over between ourselves and concluded that ef there wasn't a person in the meeting house that could pitch a psalm-tune, we were, take us by small and large, a set of poor critters; so we beckoned to Ruth Burbank—she had the best voice for counter that I ever heard. As I was sayin', we beckoned to Ruth, so she came over to where we sot, and we told her if she would sing the counter to old Stratfield, Patty would sing the air, and I would sing the treble. Ib

"Well, I will,' says she.

"Upon this, we all three riz, and begun to sing right off afore our courage had time to cool, and from that day to this I've never hearn any music that sounded so well to me as that did. Patty's voice was as clear as a bell, and as for Ruth's as it floated up among the oak rafters of the meetin'-'us, I never heard a skylark's, when it flew up from its nest, jest in time to catch the fust streak of mornin' sunshine on its wings, that was half equal to it. It brought two-thirds of the people to their feet afore they knew it, as they arterwards said. We kept on till we sung the four first lines, so as to give the Deacon time to gather up his scattered idees, and then he went on and lined it regularly, so that whoever had a mind to could j'ine; and I don't think there was a single pairson, man, women, or child, that had any pretensions to a voice for singin' but what struck right in. Somehow they couldn't seem to help it. As for the Deacon, the haze seemed to be cleared away from his mind, and he read the hymn equal to any minister. Singin' that hymn seemed to take the nonsense all out of us young ,olks, and for that day we thought no more about diggin' potatoes with goold hoes, nor of the dog with his head in the dipper."

"And what kind of an address on education did Mr. Crane give you?" inquired Paul.

"Oh, 'twas passable,'j replied Aunt Tabitha.

"One thing is sartin," said Mr. Dawkins, "it didn't lack for long, highflown words. I remember I went to see Darcus that evenin', and so we tried to pick out some of em' in the dictionary, but arter all, we wa'n't much the wiser for 't."

" 'Twould all done well enough," said Mrs. Dawkins, "ef the highflown words had seemed to come in naterally and in the right place but they didn't. Towards the winding up, I remember there was one sentence in a partic'lar manner that made me think of a great starin' red patch on the back of a black coat "

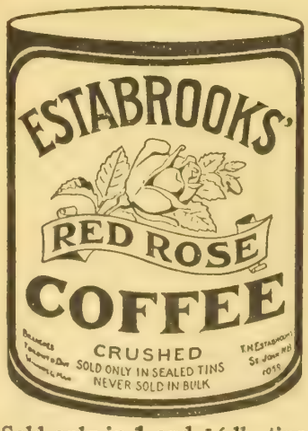
"Paul, do look at your watch," said Aunt Tabitha, "and see what time of day 'tis."

"Almost four," was his answer.

"Well, I declare, how fast time does run! Why, Darcus, what a workin' body you are! You've kept your fingers flyin' at yer knittin'-work, while I've done nothing but talk. Well, you and Jacob and Paul must do the talking' now, and Lizzie and I'll go and see about gettin' tea."

THE END.

Estabrooks' Coffee is full of snap and fine flavor. It gives genuine satisfaction to the last drop, and brings back the cup for more. It is as uniformly good as Red Rose Tea. It does not contain an atom of chicory, nor any other adulterant. You will certainly enjoy it.



Sold only in 1 and ½ lb. tins.

The Standard of Piano Construction

The question of quality is the only one which should be considered when buying a piano.

The beauty and permanency of tone—delicacy of touch—superiority of materials and workmanship—are synonymes of quality.

The recorded judgment of eminent musical experts is—that the New Scale Williams quality is the standard of piano construction.

New Scale Williams

You will find our new Catalogues of vital assistance in selecting the best piano for your home. We will send these free on request, and also explain our plan of easy payments, if you care to purchase a New Scale Williams Piano in that way.

How to Make Farm Hands Tidy.

At a meeting of the Woman's Institute for the benefit of farmers' wives a paper was read on the artistic decoration of the home, and especial stress was laid upon the wife's having a dainty table. It was written by a woman whose home was luxurious and whose taste was exquisite, says The Delineator for April.

"But," asked one woman, "how can I have a 'dainty table? I have ten in the family—four children, four hired men most of the time, and my husband and myself. The hired men are generally foreigners, hopelessly untidy. It is all I can do to get them to wash their hands and faces and comb their hair before they come to the table. I cannot set a separate table and get through with my other work. How can I manage to have a 'dainty table?' The men soil the table-cloth and wipe their mouths on their sleeves, and I'm—well, I'm just discouraged. I tried furnishing them napkins, but I would have to give them fresh ones at each meal in order to keep them decently clean. That meant more washing than I could do, so it was out of the question." And the speaker's eyes filled with tears, for this was one of her unsolved problems.

"Well, sister, I'll tell you how I manage," smilingly answered a bright faced woman. "In the first place, I put a wash-stand covered with white oilcloth, with a pitcher and bowl and tin slop-jar, out in the back entry. I hung up a mirror, brushes, combs and nail-cleaner (I bought them at the ten-cent counter) also a long roller towel, a shoe-brush, a small broom, and a big piece of soap. Then I said to the men, 'This is your dressing-room. You must make yourselves tidy before coming to the table. In the house I make the rules, and if you do not comply with them I shall fine you five cents for each transgression, and deduct it from your wages."

Chocolate Icing.

A black chocolate icing that is smooth and soft without being sticky is rather hard to find but the following one is excellent of its kind and is specially good on white cake or on small cakes. Melt gradually, so it will not scorch, four tablespoonfuls of grated or scraped chocolate. When melted stir in three tablespoonfuls of milk or cream and one of water. Mix well and add one scant teacup of sugar. Boil about five minutes. Stir only enough to keep it from burning. When the cakes are nearly cold ice with this icing, using as warm as possible only allowing it to cool enough so it will not run.

Baking Day Convenience.

A baking day convenience is made of two holders sewed on a tape. Have the tape about a yard long, sew a holder on each end and when in use slip it through the apron band on the right side. It is always in place and, being loose, can be slipped back and forth as it is needed.

When the digestion is all right, the action of the bowels regular, there is a natural craving and relish for food. When this is lacking you may know that you need a dose of Chamberlain's Stomach and Liver Tablets. They strengthen the digestive organs, improve the appetite and regulate the bowls. Sold by all dealers.

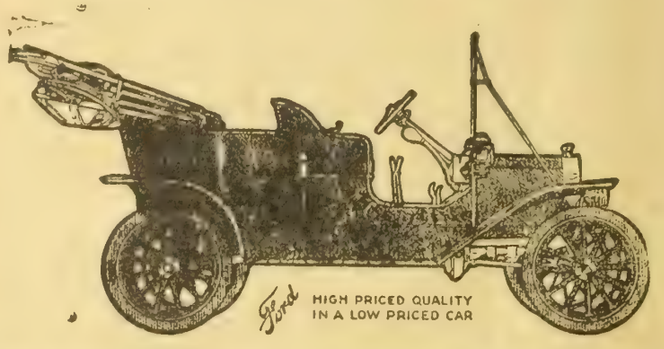
FREE $11,000 in Prizes FREE

Will be Given Away by

The Maritime Farmer, The Halifax Herald and The Evening Mail

First Grand Prize in Each District



$1250 FORD TOURING CAR.

The Object of This Great Voting Contest.

Primarily the object of this great prize contest is to secure new paid-in-advance subscriptions to **The Evening Mail, The Halifax Herald** and **The Maritime Farmer,** while doing this, to ascertain who are the most ambitious, energetic and popular men and women of this section. Resourcefulness, patience and get-there-quickly are the qualities developed in men and women every day by live competition. Competition is the life of success and it also makes achievement worth while. This contest means that the winners will be the kind of people who appreciate these things. It is a business proposition for men and women who love the excitement and attainments of business. Built on business principles, it is for business people.

There are many who do not receive as a six months' or a whole year's salary as much as what any of the Thirteen Grand Prizes, to be awarded in this contest amounts to. And the best part of it is that the competition which will bring such success in this big contest is only a good use of spare moments. It will be a campaign of votes by the candidates among the people with whom they come face to face—those whom they can reach by telephone and by writing letters; through the assistance of personal friends and the interest aroused in the public. In a word, it costs nothing to participate in this contest.

The $11,000 in prizes to be distributed under the terms of the contest is by far the most liberal offer ever made by a newspaper in Eastern Canada and British North America.

Farm Problems.

Unpregnant Mare Giving Milk.

W. D. S., Anagance, N. B.—I have a mare that is giving milk although she never had a foal. She has a bag the same as if she had recently dropped a foal. She had the service of a stallion about the 5th of April, 1910 and again on the 22nd June. I have been obliged to milk her several times since the last breeding. She is in seeming good, healthy condition, and her food is clover and grass.

1. What would be the best food to give her?
2. Will driving hurt her while under treatment?
3. What treatment should I give her?
4. Where had she better be kept, in stable or pasture?
5. Is there any danger of complicated diseases setting in?

Ans.—Mares, occasionally, develop mammae and secrete milk although not pregnant. However, this query could be more satisfactorily answered if W. D. S. had stated whether or not the mare had been bred in 1909 or early in 1910, as, sometimes mares will accept the horse during pregnancy and often when a foetus dies in utero, if not expelled in a few days, the dam's mammae will enlarge and milk may be secreted. A careful examination by a competent veterinarian would discover if a foetus is retained and give the necessary treatment.

1. The food given is suitable while idle. If mare is worked, oats, wheat and bran, sufficient to maintain her in a vigorous condition would be a desirable suppliment.
2. No, if not excessive.
3. Exercise for a few hours, twice a day. Do not milk unless the udder is hard and painful, but rub it gently twice a day, with an Anodyne Oil made by mixing half an ounce of Tincture of Camphor, half an ounce of Fluid Extract of Belladonna and eight ounces of raw linseed oil.
4. Either stable or pasture is a suitable place for her, but if she is in pasture, exercise will not be necessary.
5. No complicated diseases will set in if the above treatment is faithfully given.

J. STANDISH, V. S.

Colt Bled to Death.

B. W. E., Andover, N. B.—A few days ago, my mare dropped her colt two days after time due. I was with her at the time, and in a few minutes tied the navel cord three inches from body, cut cord one inch from tie and in a few minutes he was on his feet. This was at 8 o'clock in the evening. At 10 o'clock I went to see the foal and found him bleeding at the navel. I thought the string had become loose and retied it one inch above first tie and the blood stopped. He was strong and I left him sucking. At 2.30 o'clock, next morning I found him dead, the navel cord had bursted above the tie and he had bled to death. Kindly give me your opinion of this circumstance and some advice re the way to handle a new born foal.

Third Grand Prize in Each District

$400 UPRIGHT PIANO

Vigorous Manhood.

Two "Health Belt Men." One 50 Years Old, the Other 30. Can You Pick Out the Younger ?

I can show you how to restore your youth and how to keep it. A "Health Belt Man" CANNOT grow old; he must be young forever. Years count for nothing in this life, so long as you have great vitality. Weakness, Nervousness, Unmanliness are conditions to be laughed at by the intelligent user of my great appliance, for it gives in abundance, all that vim, vigor and nerve force which the weakened system craves—Worn every night and all night for two or three months, it sends a great, warm, glowing volume of electricity into your body through the nerve centres at small of back from the first hour's use you experience a decided benefit; there is a great mysterious force which gets right to work. No drugs to be taken; no conditions imposed except that dissipation must cease. Help Nature that much; the Belt will do the rest. It takes the weakness and kink out of your back; it drives rheumatic pains away from all parts of your body, you will feel and look young and strong again; women and man noticing your physical change will be more attracted toward you on account of your new vitality and life; in two months you can experience the full vigor of perfectmanhood, or you need not pay.

YOU CAN PAY WHEN CURED.

If you're sceptical I'll prove it first. I'll take all the risk by letting you have the Belt on Free Trial, not to be paid for until cured. Send it back if it don't do the work.

Let Me Send You These Two Books FREE.

They fully describe my Health Belt and contain much valuable information. One is called "Health in Nature," and deals with various ailments common to both men and women, such as rheumatism, kidney, liver, stomach, bladder, disorders, etc. The other "Strength," is a private treatise for men only. Both sent upon application, free, sealed, by mail.

If in or near this city, take the time to drop in at my office that you may see, examine and try the Belt. No charge for advice either at my office or by mail. If you cannot call, fill in the coupon and get the free booklets by return mail. They are better than a fortune for any one who needs new vigor.

DR. M. F. SANDEN CO., 140 Yonge Street, TORONTO, Ont.

Dear Sir:—Please forward me your books, as advertised, free.

NAME.....

ADDRESS.....

When writing advertisers please mention this paper.

Ans. It requires some knowledge of the umbilical cord to understand this condition. The cord is composed of three blood vessels, two arteries and one vein. They are covered by a layer of soft tissue generally ruptured at or shortly after the delivery of the foal. Very rarely, when naturally ruptured, does it require tying, but when it requires to be cut it is advisable to tie with a soft string, one or two inches from the body. Have the string soaked in an antiseptic solution such as a three per cent. solution of creolin or carbolic acid in water and tie the string only tight enough to squeeze the walls of the vessels together and prevent the blood from flowing out of them. If the string be a hard squeeze rhe soft tissue partly off one and drawn very tight it may and allow the blood to escape which suppose was the condition in B. W. E's. colt. st is advisable to dress the navel two or three times a day with the above advised antiseptic or any other good one to prevent infection at that part. The dressing should be continued until the navel heals.

J. STANDISH, V. S.

NOTICE TO SUBSCRIBERS.

All subscribers who paid either F. W. Cox or C. W. Brewer for the Maritime Farmer and have not had an acknowledgement of same direct from our office will confer a favor if they will send receipt to us. We will protect all such and will forward a new receipt. We cannot protect you unless we get the original receipt given by either of these parties.

A New Invention in Mowers.

At the exhibition just being held at th? city of Gjovik, Norway, considerable attention is attracted by a new style of a mower constructed by an engineer, M. Bjering. The invention is orginally a result of Mr. Bjering's efforts to construct a mower for hand-power, and the result is the principle after which the one-horse mower now exhibited is built. On the old style of mowers the power is transmitted by cogs or chains, while on this new mower this is done through levers and springs, that appear to be very simple and easily managed. The new mower runs so much more easily, that it is astonishing. The cutting mechanism is also different, being constructed on the scissors system, instead of with knives. The mower has a far larger cutting power, for which reason the enormous speed of the cutting bar is reduced by one-third as compared with the old style and this saves considerably in pulling-power, so that a man can easily pull a one-horse mower at work.

The intention of the inventor is to make mowers for hand power only, and it is said that he is guaranteed a sale of 20,000 such mowers yearly to France alone. Patents are being taken out in all countries.

C. E. SONTUM.
Trade Commissioner, Christiana, Norway.

Cutting a Board.

The board was 10 inches and a fraction in width, and the carpenter's apprentice with his rule and a pencil was trying to divide it into three equal parts.

"Hang it," he said, impatiently, figuring away, getting bigger and bigger fractions, and still far from the accurate division that he sought. "Hang this business."

"Here's the way to do it," said the old carpenter.

And he took a foot rule and laid it across the 10-inch board obliquely, so that the oblique measurement just made 12 inches: Then he marked off three equal divisions, one at the 4-inch line, the other at the 8.

"You will find that divides your board quite accurately," he said. "It is the easiest way for a carpenter to make divisions. It works on any width or any number of desired divisions. To divide a 9 3-4 inch board in four parts, for instance, you'd make your rules measure obliquely just 10 inches across the board, and then you'd mark off your divisions at 2 1-2, 5, 7, 1-2. This is a handy thing to know. It saves a man many a quarter-hour of tedious ciphering."

Testing Butter by Babcock Test.

We do not recommend the testing of butter for fat by the Babcock test. The results obtained are inaccurate because the butterfat is such a large percentage of the butter that all the errors of analysis in sampling, weighing and measuring must be charged to the butterfat and this makes it impossible to get results which can be depended upon as accurate. It is true that occasionally a test may be made of butter that will be very near the correct figure, but it is also true that the results obtained by the Babcock test may be from one to three per cent off.

The best way to determine that fat in butter at the creamery is to make a moisture determination and a salt determination of the sample, add these two together, then to the sum add one per cent, which represents approximately the amount of curd in the butter, then subtract this sum from 100; the difference will be very nearly the fat content of the butter. The results obtained in this way will be far more nearly the correct figure than the results obtained by trying to test the butter with the Babcock test.—Hoard's Dairyman.

Factors Influencing Yield of Cheese

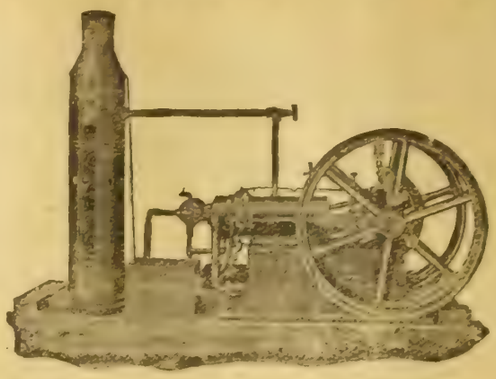
The yield of cheese is influenced by a number of things under the control of the cheese maker, such as the sweetness and flavor of the milk, but principally by the per cent. of fat and solids-not-fat in the milk.

If milk is slightly tainted the cheese-maker must handle it in a way during the cheese making process that will diminish the yield over the amount of cheese that could be obtained from the same milk if it was perfectly sweet and not tainted in any way.

The approximate yield of cheese can be calculated by multiplying the pounds of fat by 2.6 For example, if 100 lbs. of milk test 3.0 p. c. fat this will probably make 3.0x2.6 or 7.8 lbs. of cheese per 100 lbs. of milk, if it tests 3.5 p. c. fat, 3.5x 2.6 or 9.1 lbs cheese; if it tests 4.0 p. c. 4.0x2.6 or 10.4. By using this factor 2.6 you can calculate approximately the yield of cured cheese from milk of any test, provided the milk is perfectly sweet and in a satisfactory condition for making cheese.

Dysentery is a dangerous disease but can be cured. Chamberlain's Colic, Cholera and Diarrhoea Remedy has been successfully used in nine epidemics of dysentery. It has never been known to fail. It is equally valuable for children and adults, and when reduced with water and sweetened, it is pleasant to take. Sold by all dealers.

Farmers of Quality



Stationary and Mounted, in 1 1-2 to 30 Horse Power.

Want Quality!

Readers of THE MARITIME FARMER are of the quality stamp; we realize their discerning ability to pick an article of machinery that is correct in every mechanical detail. That is the reason why such care is taken to see that the **Ideal Gas and Gasoline Engines** are what we claim for them.

Every part of the "**Ideal**" is interchangeable—a mighty strong feature. The cylinder, instead of being cast with the base, is cast separate and bolts on the base. The valves, instead of seating directly on the cylinder head are enclosed in a valve cage, and the valve cage is inserted in the cylinder head, so that when the valves become worn, the valve cage and valve can be taken out and ground without removing the cylinder head.

The idea of casting the cylinder separate from the base is a good one, for when the walls of the cylinder become worn you don't have to buy a complete new engine, you only require a new cylinder that can be bolted on the base. Another good feature is an extremely long piston with double rings instead of using three rings. We use three sets of two rings each on the Ideal.

Another thing, there is a speed regulator on this engine which enables you to run the engine at any speed, and, of course, when you reduce the speed of the engine, you also reduce the fuel consumption. For instance, if a man had a 6 H. P. engine and wanted to run a cream separator with it, he could reduce the speed and thereby cut down his fuel consumption to suit the work.

All these are points to consider when looking for a gasoline engine of quality—one that stands without a peer.

"**Ideal**" **Gas and Gasoline Engines** are built on honor and built to give their operators satisfaction, and they do it. We do not build a cheap or low grade engine, but do cater to that class of buyers who wish a first class article at a reasonabl price.

Calf Scours.

There are many different remedies for calf scours. One which has been found very successful is the use of formalin. Dr. Klein, of the U. S. Bureau of Animal Industry, recommends it very strongly. The way to use it is to dilute half an ounce of formalin with fifteen and a half ounces of water. A dose consists of a teaspoonful of this solution to each pint of milk fed to the calf. Out of twelve calves that had scours treated in this way, eleven recovered without further treatment, seven of them recovering on the second day, three on the third and one on the ninth.

Heaviest Hay Crop in Thirteen Years

The Maritime Farmer :—

Please find enclosed my cheque for $3.00 to pay subscription to April 1912. If Not too late you may send me the Free Accident Policy for $1000.00. I have been so busy lately that I neglected sending before.

About done haying now. Crops the heaviest for 13 years. Land seeded from one to seven years averaged 2½ tons to the acre. Grain crop also very heavy.

Yours truly
J. W. DOUGLAS.

Caledonia, N. S.

Interview with Mr. E. B. Elderkin.

The following interview appeared in a recent issue of the Trinidad Mirror:

Mr. E. B. Elderkin of Amherst, N. S., Canada, and representing the Canadian Department of Agriculture has been staying at the Queen's Park Hotel for the past few days. No stranger to Trinidad, he paid the colony a flying visit some two years ago. Mr. Elderkin is anxious to see closer relations established between the Dominion and the West Indies.

Asked as to the object of his visit Mr. Elderkin said: I am here with a view to seeing what development is taking place here, commercially and agriculturally and more particularly as to stock.

With regard to stock your people cannot do better than to get their fresh blood from us.

But was there not some question about Canadian stock being not quite what it should be? Your commercial agent, Mr. Tripp, took up the cudgels in its behalf some time ago in his usual effective and convincing style, and as we have heard nothing about it lately it is to be supposed that he dealt with the objection satisfactorily.

To this Mr. Elderkin replied: I was not aware of the incident, but I can assure you that our stock is absolutely free from infectious disease. There may be a little tubercular, as there is everywhere you know, but there is less in Canada than there is anywhere, and our department, under Dr. J. B. Rutherford, is making every effort to encourage our people to bring about the better production of a higher class of animals of all kinds—cattle, sheep, swine and poultry.

Yes; some very fine animals have been received from time to time from Canada.

Yes, I know, said Mr. Elderkin, and our herds are as healthy as the herds anywhere. Why the British Government are recognizing that, because, just as I was leaving, I saw that the British Government is likely to withdraw its prohibition against Canadian animals, which hitherto have been slaughtered on arrival in a British port. They are going to withdraw that.

That will be good news for Canadian breeders and should encourage them.

Yes, we are aiming at that. Do you know, sir, you have a magnificent country in every respect, and so far as I have seen you have a fine lot of animals, but I cannot help thinking that a larger infusion of Canadian blood would help them. You see it is this way. A warm country is not exactly adapted to the production of the better class animals unless you have a good supply of fresh thick blood run into them constantly. They want vivifying with fresh blue blood. I gm glad to hear that your crops are exceptionally good this year.

Yes; they have been very good. Cane has been better than it has been for many years past. Cocoa has been splendid—if prices had only been a little better.

Yes; you have seen better prices for cocoa haven't you? Two years ago you were all cocoa and now you are all oil. I suppose there is plenty.

You have generally what we want

READ ABOUT THE GREAT INVENTION
THE ECCENTRIC SPROCKET WHEEL

Long spokes give greater tying-power. (See arrow A.)
Short spokes give swifter bundle discharge. (See arrow B.)
When you take hold of a heavy stone, exert all your strength and it refuses to budge, what do you call for? A long crowbar, of course. Why? Because greater power is obtainable with the long lever.
The great Invention—the Eccentric Sprocket Wheel (note arrow C)—is built on the principle of the lever. The long spokes (see arrow A and note how much longer than at arrow B) act as long levers—give greater leverage power.

It works out this way:
On our No. 3 Binder, when the bundle is about to be tied, the chain is pulled over the long spokes, which exert all their great leverage power—fully 16⅔ per cent. more than is obtainable with the ordinary wheel. The grain is compressed far more tightly.
You get a neater, more compact bundle and save considerable TWINE. Easier to pick up. Easier to carry, easier to shock.

Immediately after our Knotter ties the bundle, the chain is pulled over the short spokes (see arrow B and note difference in length of spoke as compared with arrow A). The shorter spokes greatly increase the speed of the chain. The bundle is given a swifter discharge than with ordinary wheel, and the needle is speedily brought back, out of the way of the downcoming grain, into position for the next sheaf.

The Eccentric Sprocket does this, too—it prevents that "jar" or "jerk" always noticed on other machines when a bundle is being tied and discharged. You will not feel it on the No. 3; neither will your horses be annoyed by it, nor "the life" of the machine be shortened. Frost & Wood No. 3 runs along and does its work without even a suggestion of that "jerk."

Now, you see why every maker would put the Eccentric Sprocket Wheel on his binder if we did not control the patents for Canada. You see why it's wise to invest a post card and get our Binder Booklet so as to become thoroughly posted on the peer of them all—the Frost & Wood No. 3.

You are on the right track when you start investigating our No. 3—the binder that is built by a purely Canadian Company, who thoroughly understands Canadian conditions. We would like you to read a few of the hundreds of testimonials we have received from Canadian farmers, which back up our claims to the letter.

Just write us for catalogue

Full course at the Nova Scotia Agricultural College, Truro, N. S., begins November 1st, 1910.

Short courses at the Nova Scotia Agricultural College begins January 3rd, 1911.

Ladies Short Courses at the Nova Scotia Agricultural College, begins January 4th, 1911.

Don't Put Off

Seeing your friends and having them join in for a club of subscribers.

in Canada and we in Canada have what you want in Trinidad and I think we could trade with mutual advantage. You see Canada is not a self-contained country like that of our friends to the South of us; but Canada and the West Indies can produce everything that either of us wants, and I hope we shall enter into a closer relationship when we get our new fast steamers. I feel I have been rather unfortunate in this visit, because you see the head of your department, Professor Carmody, is away and your second man, Mr. Carruthers, is I am sorry to hear ill.

Are you going to stay any time?

I am going to Demerara on Wednesday and I shall retdrn on the same steamer. Then to Barbados and remain there for some days. Then Grenada and then up to St. Vincent, St. Kitts and Domibica. Then back to Barbados. Then I shall take the Royal Mail to Jamaica and home that way. I hope when we have better and faster steamers, that we shall become better acquainted and your people will come to see us and out people will come down oftener to see you. I can assure you that it would lead to our mutual advantage.

After a few more remarks of a similar nature the interview came to a termination.

The PUBLISHER'S DESK.

G. T. P. Dining Car Service.—The Dining Car service of the Grand Trunk Pacific is already commencing to attract very favorable comment. A few days ago a number of representatives of Marshall Field in Chicago, gave the following unsolicited testimonial:—"We have travelled extensively and in our judgment the service and cuisine are as perfect as any we have ever experienced." C. H. Ford, Field Manager, Chicago, Ill. H. L. Johnson, Sales Manager, New York City.

Absorbine Abroad.— The demand for the well known remedies Absorbine and Absorbine, Jr., in foreign countries has become so persistent that the manufacturer W. F. Young, P. D. F., of Springfield, Mass., has found it necessary to go abroad and get in closer touch with conditions there. Mr. Young left Montreal on July 9th, on the S. S. Laurentic for an extended tour of Great Britain and the Continent. At the present Absorbine can be procured in many of the largest centres and from chemists throughout Great arrange the distribution so that Britain, but Mr. Young expects to customers abroad can be supplied as handily and speedily as in the States. It is gratifying to note the great strides Absorbine is making as it is a remedy of exceptional merit and no claims are made for it hat are not fulfilled.

The many readers of this journal will notice scattered throughout its news and reading pages, notices appearing with each issue on five family remedies. These notices, we hope will not escape a good big share of the readers attention at all times for they lend a helping hand to the home and when once tried will always be used. These preparations have thousands of friends all over the Dominion to-day, and are fast becoming the most popular remedies in the market. In border and foreign countries where during the past 50 years they have been thoroughly tested and are now becoming so popular and so well established that Chamberlain's Remedies are more often termed "The tea and coffee of the drug trade". This last little phrase is quite sufficient to carry to each and every reader what may be expected what results follows a bottle of Chamberlain's Colic, Cholera and Diarrhoea Remedy, a bottle of Chamberlain's Cough Remedy, a bottle of Chamberlain's Liniment, a package of Chamberlain's Stomach and Liver Tablets or a pat of Chamberlain's Salve. Ask your dealer or druggist about these preparations and if you try a package of any of these lines and after using some you are not perfectly satisfied return it immediately to your dealer and get your money back. Each article being guaranteed.

FARMERS OF THE EAST

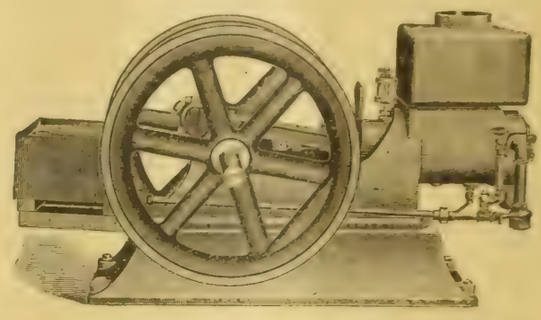
should take out an agency for the easiest selling Gasoline Engine on the market to-day. We refer to the

"WATERLOO BOY"

FROST PROOF STATIONARY ENGINE

The most complete and up-to-date Gasoline Engine on the market to-day.

Write at once for full particulars. We will give you every assistance in making a sale. Don't delay, the territory you want might be taken if you wait until to-morrow.



I am a "Waterloo Boy" but can do the work of several horses.

J. D. FRIER, - Sussex, N. B.

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, **free** of any charge, my **home treatment** with full instructions to any sufferer from women's ailments. I want to tell **all** women about this cure—**you,** my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourself at home without the help of a doctor. Men **cannot** understand women's sufferings. What we women know **from experience,** we know better than any doctor. I know that my home treatment is a safe and sure cure for Leucorrhœa or Whitish discharge, Ulceration, Displacement or Falling of the Womb, Profuse, Scanty or Painful Periods, Uterine or Ovarian Tumors or Growths, also **pains in the head, back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weakness peculiar to our sex.**

I want to send you a **complete 10 days treatment entirely free** to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that **it will cost you nothing** to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week, or less than two cents a day. It will not interfere with your work or occupation. **Just send me your name and address,** tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you **free of cost,** my book—"**WOMAN'S OWN MEDICAL ADVISER**" with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it and learn to **think for herself.** Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures **all, old or young.** To **Mothers of Daughters,** I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness, and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this **Home Treatment** really **cures** all women's diseases and makes women well, strong, plump and robust. **Just send me your address,** and the free ten days' treatment is yours, also the **book.** Write to-day, as you may not see this offer again. Address:

MRS. M. SUMMERS, Box H 309 - WINDSOR, ONT.

Railroads and Their Relations to the Public.—The man who knocks on the railroads belongs to the Lobsteria. As the railroads prosper we all prosper. When the shops shut down, orders for iron are cancelled, and the empties line the sidings, we are all up against it, and the bread-line forms. Always in times of stress a vast number of people look to the Government for relief. But what shall we say of a Government which makes war on those who are now giving work to millions, and thereby assure us peace and prosperity! If the men in charge of our Government insist on being Business-Baiters, the horse roar of the mob, demanding work or bread, will again be heard, and women and children will be pushed defenseless into the storm. Business in this country gives work and wages to everyone who wants to work. Let business alone. Ex-party actions against the railroads should be forbidden by the Statute. Burglary, hold-ups, strong-arm tricks, rape, are all ex-parte proceedings. And what think you of the dignity of a President who resorts to an ex-parte action in order to gain a cheap and transient legal victory over a very important part of the people whom he has sworn to protect in their legal rights. The railroads have only one thing to sell, and that is transportation and the people of this country are willing and anxious to pay for the transportation all it is worth. We are not mendicants, and we ask for nothing at less than its value. He who tries to incite class-hatred and makes it appear that there is war on between the railroads and the people, is a wicked-sham. The railroads thrive only as the people thrive, and every railroad manager knows it.—ELBERT HUBBARD.

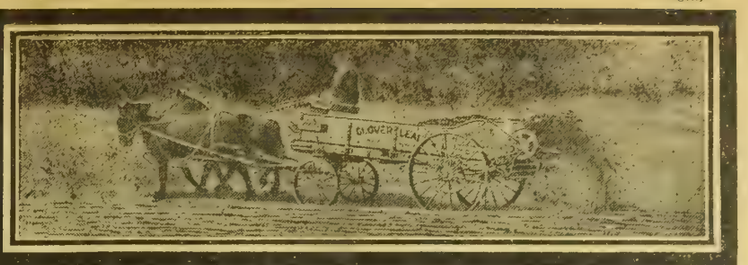
Fredericton Business College in New Quarters Sept. 1st.—As a result of the extensive improvements being made to the Inches building at the corner of York and Queen Streets, the Fredericton Business College at present located in the Pitts Block on York Street, will have quarters second to none in the Maritime Provinces, and surpassed by none in Canada. The new quarters of the Business College will be on the third floor of the Inches Block. The situation itself could hardly be bettered, the windows giving an excellent view of Queen Street, Phoenix Square, the grounds of the Provincial Normal School and the river. The new quarters are to be occupied by September 1st. The third floor of the Inches building is being entirely remodelled. When the alterations are completed there will be several large and commodious class rooms, divided from one another by glass partitions. There will also be a separate office for the principal, Mr. W. Osborne, located at the right on the main stairway. The toilet rooms will be in the extension of the Inches block which faces York Street. Another storey is being added to this part of the building, and doors cut through the rear walls of the latter to make the necessary connection between the two. Hardwood floors are to be laid throughout all that part of the building which is to be occupied by the Business College. Steel ceilings are also to be used. The walls of the College premises will be finished burlap. Particular attention has been devoted to the heating and ventilation of the new premises, both being particularly important in connection with schools or similar establishments. The ventilation of the new premises will be by two chimneys which are to be used no longer as chimneys. Summer and winter ventilators are to be installed. The Business College will have its own heating apparatus. A combined hot water and hot-air system is to be used and it is calculated to keep the temperature comfortable at all times. Electric lights are to be installed throughout the rooms. In the past the Fredericton Business College has achieved a position in the forefront of the business-teaching institutions of Canada. It will no doubt continue to advance under the direction of its present energetic principal and with the further advantage of being located in magnificent quarters. The school on account of being situated in the educational centre of the Province of New Brunswick has an advantage possessed by none other.

Maritime Live Stock for Wyoming.

Mr. Jas. McLay, of the Wyoming Agricultural College staff, left Sussex, on the 26th, with a carload of purebred dairy cattle. Mr. McLay is no stranger to a great many of our readers. When opportunity offered he was not a bit loath to recommend to the college authorities the advisibility of procuring new blood along dairy lines from Maritime Province herds.

The shipment consisted of Jerseys, Ayrshires, Canadians and Holsteins bought from the following herds: Logan Bros., Amherst Point, N. S., five Holstein heifers; Samuel Dickie, Onslow, N. S., one Holstein heifer; and one Holstein bull; Retson Bros., Truro, N. S., one Ayrshire cow and calf; C. P. Blanchard, Truro, N. S., one Ayrshire cow; Nova Scotia Agricultural College, one Ayrshire bull; J. Frank Roach, Sussex, one Ayrshire heifer calf; Walter McMonagle & Sons, Sussex, one Jersey heifer, and one Jersey bull; Robert Robinson, Sussex, one Jersey heifer; Sir Wm. Van Horne, St. Andrews, N. B., four Canadian heifers and one Canadian bull.

The stock was selected by Mr. McLay in company with Prof. Faville, chief of the live stock division at the Wyoming Agricultural College. The lot included some splendid animals that have a line of producing ancestry behind them that should show good results in the individual animals and their progeny, provided they get the proper care that is so essential to the development of the best traits as profitable producers.



Investigate The Record of The Spreader You Buy

BEFORE you buy a manure spreader, find out what it has done for other farmers. That is the best proof of what it will do for you. Investigate carefully, and you will find that in the matter of service rendered, there are two machines that rank high above all others. These are the—

I H C Spreaders

Cloverleaf **Corn King**

They have proved their value in actual use in the hands of hundreds of satisfied farmers. Choose one of these machines, and you will be sure of getting the full value of your manure by spreading it in the most economical and efficient way.

Here are a few "reasons why:"

The mechanism which transmits the power from the axle to operate the apron and beater on I H C spreaders is simple and efficient. It requires little power to operate—does not get out of order.

The beater is strong and positive in its action. It thoroughly pulverizes the manure and distributes it evenly. It can be quickly regulated to spread manure as thickly or as thinly as desired This adjustment can be made from the driver's seat while the spreader is in operation.

The wood in I H C spreader frames is hard, resinous, non-porous, very regular and narrow ringed. It is air-dried so that the sap is retained—cementing the wood fibres together. This prevents manure liquids from penetrating it and makes it proof against the action of the acids in the manure.

Wide-tired wheels and roller-bearings insure light draft, making I H C spreaders easy on the horses.

The Cloverleaf spreader has an endless apron. The Corn King spreader is of the return apron type. Either can be furnished on special order with lime hood for spreading commercial fertilizers, and drilling attachment for distributing manure in rows. Both styles are made in several sizes, so, when you choose from the I H C line, you are sure of getting just the machine that will meet your needs.

Call on the I H C local dealer and go over the matter with him, or, if you prefer, write nearest branch house for catalogue and full information.

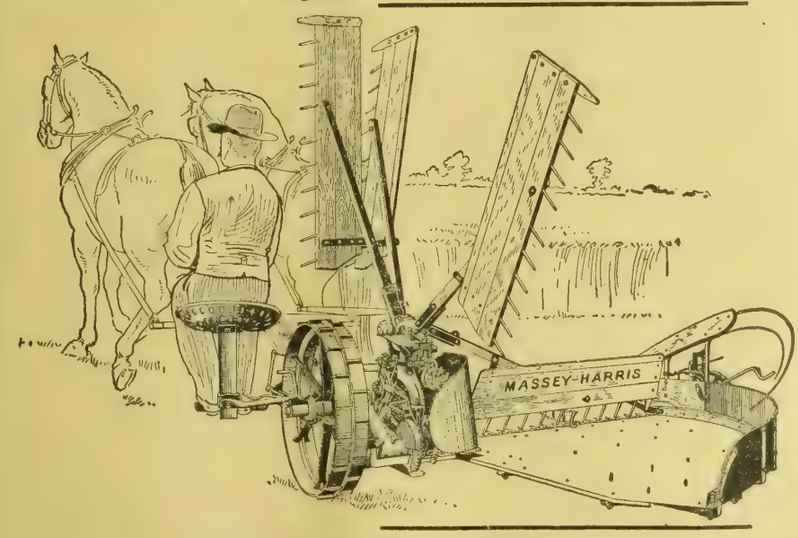
Massey-Harris Reaper.



The only Reaper with a steel platform. The large drive wheel gives ample traction. Gears are well protected by shields. Will cut clean without digging into the ground. Pitman has steel strap at knife end and brass bushing at crank end. Driver has perfect control of the Rakes. Platform is easily raised and lowered. Main wheel runs on Roller Bearings. Table is easily tilted by a convenient lever. Machine can be folded for transport easily and quickly.

THE MASSEY HARRIS CO., Limited, - Moncton, N. B.

MARKETS.

Charlottetown Prices.

GRAIN.—Oats 40c to 42c.

FEED STUFFS AT RETAIL.—Bran, $1.25 to $1.30; shorts, $1.35 to $1.40; middlings, $1.40 to $1.50; oil-cake, $2.25 to $2.50; corn meal, $1.85; to $1.90.

LIVE STOCK.—Butcher's cattle, 5c to 5½c liveweight; milch cows, $30 to $45; sheep, 3½c to 4½c liveweight; lambs, 5c to 6c lb. liveweight

DRESSED MEATS.—Beef (carcass), 10c to 12c; mutton, carcas, 8c to 9c; veal, carcas, 4½c to 6c; lamb, carcas, 11c to 12c, pork carcas, 10c to 11c.

HORSES.—Drafters, $150 to $300; roadsters, $150 to $225; carriage $140 to $200.

DAIRY PRODUCTS.—Creamery butter prints 22c to 22½c, creamery butter, solid, 21½c to 22c; dairy butter, 17c to 18c.

POULTRY AND POULTRY PRODUCTS.—Eggs, 15½c to 16c; fowl, 10c to 12c; chickens, 50c to 65c a pair.

FRUIT.—Cherries, 10c to 12c quart; raspberries 9c to 12c quart; currants, 8c to 12c quart.

VEGETABLES.—Carrots, 5c per bunch; potatoes, old, 60c per bushel, new, $1.25 to $1.50 per bushel; turnips, 40c to 60c per bushel; beets, 5c per bunch.

MISCELLANEOUS.—Hay, $9.00 to $9.50 straw, $5.50 to $6.00; wool, 23c cash; beef hides, 8c to 8½c calf skins, 10c to 12c; sheep skins; 25c to 30c; lamb skins, 25c to 30.

There is not much change in markets since our last report.

Oats took a sharp advance but are today a little easier again and our quotations are about what shippers would be willing to pay. Potatoes are scarce and the old stock is about cleared up and any small lots offering are eagerly sought after by the retail trade at about 60c to 65c. The new stock is just beginning to come on the market and they are selling at good prices, the quality is reported good. Small fruits are not plentiful yet but the next week or two should bring out large quantities but the crop is reported light Strawberries are over and the crop was not up to the average.

Butter holds about steady with supply sufficient for requirements. Eggs are higher and will continue to advance, but they show considerable shrink at present, poultry is scarce and quotations are purely nominal. Feed stuffs of all kinds are higher and will continue so for balance of season with further advances anticipated. There has been no meeting of the cheese board since our last report and consequently no new business, but it is generally supposed that rather too high a price was paid for cheese at last board meeting, and unless markets are stronger next meeting we do not think that the same price will be obtainable. The hay is pretty well all stored and in good order, the crop is a record one.

St. John Prices.

GRAIN—Oats, 55c.

LIVE STOCK—Milch cows $35.00 to $50.00.

DRESSED MEATS.—Beef (carcass) 6c to 10c; (retail) 10c to 22c; mutton, 5c to 8c; veal, 7c to 10c; lamb, 11c to 13; pork, 10½c to 11½c.

DAIRY PRODUCTS.—Creamery butter, 24c to 25c; dairy butter, 20c to 22c; cheese 12c to 12½.

POULTRY AND POULTRY PRODUCTS.—Eggs, 19c to 20c; fowl, 60c to $1.20; chickens, 50c to $1.10; ducks, 70c to $1.25; turkey, 14c to 20c.

VEGETABLES.—Carrots, 5c per bunch; potatoes, 80c per bush; beets, 5c per bunch.

MISCELLANEOUS—Beef hides, 9c; calf skins, 15c; sheep skins, 20c to 30c; lamb skins, 35c to 45c.

Antigonish Dairy Prices.

At the present time we are getting an excellent flow of milk and the prices for cheese are from 10¾c to 12c, with prospects of an early advance.

The local market for butter is 18c, I might say we have an excellent lot of hay but the farmers are having a hard time securing it as it is raining some nearly every day.

I am enclosing a head of timothy grown here which I think would want a lot of beating. This head measures 11½ inches, but there were many 8, 9 and 10 inches long in an acre field. How does this compare with New Brunswick.

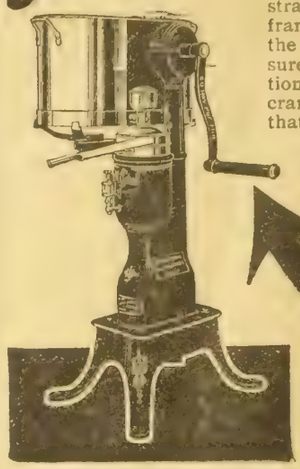
FOUR cows and an I H C Cream Harvester will pay bigger yearly dividends than five cows and no separator.

The more cows you own, the more you need an I H C Cream Harvester. The big profits in dairying come from cream—not milk. An I H C gets all the cream—quality cream—while the fresh, warm skim-milk is a money-saver when fed to calves.

A cream separator is a necessity on the modern farm. It is simply a question of Which One to buy. Thousands of progressive farmers and dairymen, after the closest investigation of all styles, have chosen

I H C Cream Harvesters

There must be some very good reasons. If you will look into the matter as closely as I H C owners have, you will find that I H C Cream Harvesters are the only ones with dust-proof and milk-proof gearings. You will find in them the most perfect straining device—insuring pure cream and skim-milk always. You will see that the frame of an I H C is entirely protected from wear by bronze bushings at all points; that the I H C has largest shafts, bushings, and bearings; that it has the safest, simplest, surest, and most economical oiling system; that the flexible top-bearing prevents vibration and keeps the bowl steady, no matter how unevenly the power is applied. The crank is at just the right height for convenient turning and the supply can is so low that it does not require tiresome lifting.



There are four sizes to choose from—350 lbs. to 850 lbs. capacity and two styles—the Bluebell, gear drive, and the Dairymaid, chain drive. Call on the I H C local dealer for complete information and catalogues, or write nearest branch house for the information you desire.

If We Want to Make Success Ourselves, We Must Buy Goods That Are Made at Home.

Why go out of the Maritime Provinces to buy any thing that is made here? You can get just as good articles here and spend your own money at home that will come back to you. Our GLENWOOD RANGES are equal to any stove made in Canada to-day and our large sales go to prove what we claim is right. We have Ranges in all styles and prices to suit every one. Made in St John. Fitted for coal or wood, with tea shelf, high shelf, hot closet, reservoir, etc. Send for catalogue and prices.

When you buy a GLENWOOD RANGE, you are keeping your money in the provinces. Get a GLENWOOD RANGE and you will have satisfaction.

McLean-Holt & Co., 155 Union St., St. John, N. B.

1 Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only one cent a word, you can advertise anything you wish to buy, sell or exchange. The address must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issue. No black faced type or display of any kind will be allowed under this head, thus making a small ad, as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

WANTED.—Hides, calfskins, sheep and lamb pelts, J. J. McLEAN & SONS, Hopewell, N. S.

SHORTHORN BULLS for sale, WALTER EATON, Upper Canard, Kings, N. S.

GUERNSEYS FOR SALE.—Two yearling Bulls, one six months old Bull and several Bull Calves.—T. D. BLAIKIE, Great Village, N. S.

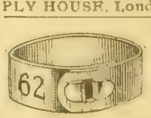
SHORTHORN BULL, 21 months old for sale at a bargain. Write me for price or better come and see him. HAROLD ETTER, Westmorland Point, N. B.

SALESMEN WANTED for the best automatic compressed-air hand sprayer made; liberal terms; sample machine free to approved agents. —CAVERS BROS., Galt, Ont.

DAIRY AND STOCK FARM FOR SALE.—Three miles from Sussex, 300 acres, 200 acres under cultivation, large intervale, cuts 80 tons hay. Good two-story house heated by furnace water pumped by windmill, good barn.—HARVEY B PARLEE, Sussex, N. B.

THREAD POWER FOR SALE.—One second hand two-horse Moody thread power for sale cheap. First set of planks still on the machine. Write POWER care of MARITIME FARMER Sussex, N. B.

ALL kinds of books on Poultry, Pigeons, Rabbits, Pheasants, Horses, Cattle, Farming, Gardening, Bees, Fruits Flowers, Vegetables, etc. Catalogue free.—MORGAN'S POULTRY SUPPLY HOUSE, London, Ont.



Perfection Ideal Band

It is the best band on the market. There are no sharp corners to chafe the fowl. They are cut clean and smooth. The workmanship is the best that there is on any Band made today. 12 for 12c, 25 for 20c, 50 for 40c, 100 for 65c. State breed bands are for. Sample and catalogue for stamp. GEO. H. SEAMAN, Moncton, N. B.

Potash and Clover.

In agricultural experiments the relative fertilizing value of different fertilizers does not always stand out clearly, as the results obtained may be rendered indistinct by the character of the soil and the season's weather; but the benefit of potash and phosphate for a clover crop is a fact that has been demonstrated over and over again irrespective of soils and seasons, and an abundant clover crop is an advantage which is felt through the rotation—"were all the merits of red clover emblazoned in letters of gold on a large canvas it would fail to convey to the mind its true value."

That potash is predominant requirement of the clover plant is shown by the fact that a crop of 4 tons of clover hay contains 180 lbs. of potash, and not more than 62 lbs. of phosphoric acid.

Horse Manure and Flies.

"Lime is the best thing to prevent flies from breeding in horse manure, but it is the worst thing for the manure. It will drive off the ammonia, better haul the manure every day and spread and plow it under, or make a fly-tight shed with fine wire screens at windows and door. Wheel the manure into this shed as fast as made and keep the door shut tight. This will keep the flies away from it. Chloride of lime is also used on the manure. There can be no doubt that flies breed in horse stables. In one case 1,200 flies in different stages were traced to one pound of manure. The total round of life of one fly is about 10 days, and the individual average about 120 eggs. This shows how fast they increase, and horse manure is their favorite breeding place."

In buying a cough medicine, don't be afraid to get Chamberlain's Cough Remedy. There is no danger from it, and relief is sure to follow. Especially recommended for coughs, colds and whooping cough. Sold by all dealers.

The Improvement of Country Roads

By A. W. Campbell, Deputy Minister of Railways, Ottawa.

MR. CAMPBELL is one of the World's best known authorities on good roads and their making. The following article appears in The Thirty-first Annual Report of The Ontario Agricultural Experimental Union.

I am sure it is quite unnecessary for me to emphasize the importance of better roads to this Experimental Union. It might be important, however, for me to refer to the fact that so far as roadmaking is concerned, to my mind, it has been a series of experiments in this country, extending over nearly one century, and I have reached the conclusion that the time has about arrived in the history of our Province when we should cease experimenting in this particular, and that we should try to have some reasonable standard of roadmaking for each county and township in the proince.

It is a well known fact that there are a few principles underlying the construction of roads, which, if we are to make a success of our expend iture of money and labor must be closely observed. You all understand the absolute importance and necessity of observing the principles underlying the construction of roads which, if we are to make a success of our exp enditure of money and labor, must be closely observed. You all understand the absolute importance and necessity of observing the principles in connection with the work in which you are especially interested, and in the building of a road as well as in the construction of any other public work, there are principles of construction which must be observed if success is to be achieved, and it is useless and hopeless for us to go on as we are still doing in many of the municipalities of Ontario. You are aware that notwithstanding the fact that in the last few years about one-half of the munivipalities of the townships of the Province have commuted or abolished the system of statute labor, yet in a great majority of townships that system still prevails. And if those who have charge of this labor were in a position to concentrate that so as to produce its value in actual work, not in the exhaustion of time and effort, what an enormous work could be performed with the labor that is taxed against land in this respect.

Mr. A. W. Campbell.

Statistics collected by our department show that there is a little over a million days of statute labor still performed on the roads of Ontario. When that million days of labor is not concentrated but scattered as it is, although these men do work faithfully, nothing but temporary work, patching and repairing can be expected. In addition to that, we have cash annually raised by direct taxation, making in all about $2,100,000 or its equivalent, spent upon the roads of Ontario annually. The clerks' returns reported at our department show that in the last ten years there has been spent nearly $21,000,000, or its equivalent, in labor on the roads.

Now, I have frequently stated that if this labor and money were given to me and I were placed in a position to concentrate it and utilize it as I saw best under fixedplans and specifications, I would undertake to macadamize in a first-class manner every rod of road in Ontario upon which the expenditure has been made in the period of ten years. If it should not be accomplished, then why should we not ask the reason why more has not been made of this money and labor.

The work has been carried out in an indefinite, shiftless sort of way. Pastmasters and road commissioners are being changed every year, and they do not get a sufficient opportunity to learn even a little of something about the principles of roadmaking before they are set aside and others placed in their position.

If we had some trained pathmasters or trained road commissioners and they were placed in charge of the work, and their positions were made secure, so that they could make plans of the roads of the townships and state what improvement is required on each of these roads, an improvement that would be in keeping with the requirement of the traffic, and that they could commence at a certain point and utilize the labor and the money as far as it would go each year in doing some fixed and definite work and extend that from year to year, in a very short time we would have a long mileage of first-class roads in each township.

Under the county road system in the county of Prince Edward, in the last two years, they assumed about one hundred miles of leading road in that county. That county now concentrates the expenditure that used to be placed upon one hundred miles of road, and they commenced at a certain point last year. They first equipped themselves with a complete outfit of road-making machinery. Without first-class implements you cannot do first-class work. They purchased regular crushers and steam rollers, and last year they macadamized twenty-two miles and this year a little over twenty miles, making a stretch of forty-two miles of the road in two years' time. Fancy what that county will accomplish in the next ten years! Fancy what they would have to-day to show for their expenditure if they had commenced ten years ago!

I do not believe it is a question that is going to disturb the people as to how the money is going to be raised. We are raising an enormous amount of money now, but the unfortunate part of it is the way the money is being handled. We want to work economies in connection with our municipal taxation, and here is where the members of this Experimental Union with your special training along these lines and with your ideas of how carefully and cautiously matters in general should be studied in order to produce the best results for your labor and expenditure, can help. There is no question of so much importance to the people to-day as that of the improvement of the roads, and there is no question in which you can afford to devote some of your special time and some of your training to better advantage than to the laying down of capable and competent plans for the improvement of our roads.

Reading an account of what you are doing here, while coming along in the train this morning, I noticed that you have been carefully studying the wisdom of under draining in connection with your farming operations. As an engineer of a good many years' experience in matters of drainage, I can only say that this is an exceedingly important matter in connection with your farm operations. It is, as I think, the basis of all farming operations. Unless land is thoroughly and carefully and perfectly drained so that the pores of the soil may be thoroughly and fully opened to receive the benefits that result from the falling of the rain and from the nourishment of the melting snow, it is useless for you to attempt to farm successfully that particular land. Tile draining and its importance in connection with farming cannot be over estimated. Tile draining of the foundation of the ordinary road is the first principle that must be observed in road-making, and unless we do see that the foundation is thoroughly and properly drained, it is as useless and as futile for us to attempt to build a road as it would be to attempt to put up a first-class building on a wet and yielding foundation.

In fact the principle of road-making is simply boiled down to the question of drainage. It is the soil after all that carries the load. The natural soil, the clay and the sand which forms the foundation for that road has to carry the load and that should be drained. Where the sand is porous or wet or boggy, it may be necessary to resort to tile draining. Place a drain underneath the roadway where there are holes or boggy places, sandy or moist spots, so as to remove all the moisture and create a hard foundation. It matters not what you put on the surface, whether it be gravel, broken stone, vitrified brick, or asphalt, if the foundation is moist, the frost enters that foundation, acts upon that moisture and when the frost disappears in the spring the foundation is left loose and unsuitable, and the crust that has been created on the surface is simply a crust resting on a yielding bottom that will crack, break, and rut under very slight traffic.

The foundation is the first thing to be obtained. The placing of the surface material, the gravel and the stone is the last subject to be con-

sidered. The great majority of our roads for years to come will necessarily have to be earth roads, and in many instances where these roads are properly drained and cared for, they are as useful and as serviceable for the little trgffic that passes over them as an asphalt pavement; but in a city where the traffic is extremely heavy, such a road would not do. We should classify these roads according to their importance We have what we call leading roads, the main arteries leading to the city. We have other roads that serve only neighborhoods and are used only by occasional teams. Then there are the division lines and back concession roads that are used by only one or two farmers, and not at just the season of the year when roads will be injured by travel. If these roads are properly drained and crowned, and attention is given to their maintenance, they will be quite serviceable roads, and can be made what would be considered ideal roads for ordinary traffic.

When we reach the next class of roads where the traffic is a little greater and where the roads are used during all seasons of the year, then it is necessary to resort to a covering of some material that will resist the wear, and that will shed the water and make a hard, smooth, wearing surface. That is why the gravel or broken stone is placed on the road. Ordinary land gravel is composed of 50 per cent. of sand, which is useless in road construction and should be eliminated. The best practice suggests that all gravel should be placed through crushers where the larger stones are broken and where the smaller stones are reduced to cubical pieces so that they will bind together and where the sand is abstracted and nothing but clean stone is retained for the road bed. Gravel of this kind is almost equal to crushed stone. Where gravel is not plentiful, we believe then is using crushed stone of the best quality that can be obtained within reasonable distances of the work. It is not practicable for us to always be able to select ideal road-making material for country roads. Trap rock is supposed to be the best. It has a hardness and toughness that will resist wear and last a great many years, but trap rock is only to be found in certain sections of the province, and the cost of forwarding it and distributing it through the country would make the price impracticable. We have to use the best material available. There are many localities unfortunately situated in the province, which have neither stone or gravel for use on the roads and which are under the necessity of importing crushed stone by rail. The cost of such roads is not expensive in the vicinity of towns and railway stations and in view of the greater durability of crushed stone, it is frequently desirable to use that material, particularly when it can be shipped in by rail close to the stations even where gravel may be obtained. The greater strength of crushed stone and the greater durability will in the end repay abundantly the additional cost.

In connection with gravel roads or broken stone roads, I wish to say that it is useless for us to go on hauling and dumping gravel, spending our time and money in putting on roads gravel that is not suitable for the requirements. The man who is charged with the making of the roads in a township should have some scientific knowledge of these things, so that he can pass upon the quality of the material and say how it should be best treated so as to make it more suitable for the best work in hand. Prepare the material which you have on hand in the most competent way to make the most of it. This is where the experimenter can inform himself to the best advantage and the fact of his constantly being in touch with the work will, in a very short time, make him a most valuable official to any county or township. Everytownship should have in its employ one man of this description who will plan in a general way the work of road-making, and who will say what drainage should be provided and who has sufficient scientific knowledge to handle an ordinary drainage level and who can take levels, plant the stakes, map out the work and see proper tools are provided and that the fall for the water is down hill and not to make the ditch first to find out whether the water will run to the north or south.

Take the proper levels and see that you have the proper directions before you commence the work of construction and then arrange to have the outlets made so as to dispose of the water in the smallest quantities, never leading it a long distance along the side of the road that will fill in and obstruct its flow, injure the fall, and ruin the road.

Drainage is of the greatest importance, and if I should only attempt to emphasize this one question to-day, I would leave you to consider the question of how broken stone should be prepared and how it should be applied. I would emphasize drainage as being what I believe to be an exceedingly important matter in connection with road-making. We can make ordinary clay roads for proper drainage, and proper grading and shaping and attention.

First-class serviceable roads for the ordinary requirements for certain districts throughout the province can be made in this way, and only the more important roads really demand the application of gravel and broken stone. The first thing in this road problem is to get the council to look upon it as an important matter, and after they have decided on their plans, they should place the work in the hands of a man who has sufficient scientific knowledge and training to undertake the work and see to it that whatever expenditure is made each year, whether of labor or money, that it should be directed along lines of of these particular plans and that every year's work, every day of labor, and every dollar of money should be made to show its value in permanent results. The plans which we follow generally in designing of the township is to classify the roads under three heads: 1. The leading roads, upon which most of the traffic passes; 2. The neighborhood roads leading on to these and subject to the traffic of the particular neighborhoods;and 3. The concession lines. The most important road should be graded to the width of twenty-four feet, the second class twenty feet, and the third class eighteen feet.

Experiments have taught us that these are about the praper widths to be used in connection with township work. After the foundation has been drained carefully, the road should be crowned so as to shed the water from the centre into the ditches. That crown should be one inch to the foot from the centre to the edge of the ditch. That is where the road is twenty-four feet wide. The fall from the centre to the edge of the ditch should be twelve inches.

After the road has been graded, it is advisable to pass a heavy roller over it so as to compact it thoroughly before the traffic is allowed to go on. If the traffic is allowed to go on the loose earth, the first team will rut it and after the traffic is pretty well directed into that rut. Water is held there and the injury commences. It is an excellent practice to roll with a twelve to fifteen ton steam roller. Horse rollers weighing from six to eight tons are being used with a great deal of success. A steam roller should be in possession of every township municipality where road-making is being done.

You cannot do this work properly without proper implements. If township councils would defer their money to the purchase of a complete outfit of machinery for the first year, they would be further ahead than by going on in the usual way without implements to do the work properly. Do not make the great mistake that many councils have made in flying away at once to purchase machinery without making provision for its operation and maintenance, and without studying who is to look after it. In many instances these machines are placed in the hands of inexperienced men. A standard should be established that could be followed to advantage and the the money that is being appropriated will be appropriated to useful purposes.

In conclusion, let me urge that in our modern road-making of to-day we seek to find and employ experienced men in this work; that we use modern road-making machinery; that we select our material with care, that we drain thoroughly, that we grade in a workmanlike and permanent way, and that throughout all we seek economy in efficient management of men and teams in this work.

Community Co-Operation in Live Stock Breeding.

A subscriber who was interested in remarks published in a recent issue of the Maritime Farmer re Community Co-operation in Live Stock Breeding, sent the following article for publication:

"A careful investigation of the advertising columns of our agricultural papers will impress one with the widely separated homes of the individuals belonging to our various breeds of live stock. If we undertake to purchase a herd of Red Polls or dairy Shorthorns, we find the individual herds of these breeds scattered to the four corners of the earth. In other words, we are unable to locate a Red Poll or dairy Shorthorn centre or community, but we find it necessary to travel many miles in order to inspect the animal offered for sale. What is true of these two breeds is true to a greater or less extent of all breeds of live stock. There is a tendency for a farmer starting with purebred live stock to get a different breed from his neighbor, instead of getting the same breed and co-operating with his neighbor in advancing the interests of that breed in their community. There seems to be a lack of unity and steadfastness of purpose, if not a lack of enterprise in the breeding, feeding and marketing of our live stock.

"At the present time considerable interest is manifested in getting a neighborhood interested in some one breed of horses, cattle, sheep or hogs. A study of the development of our improved breeds of live stock shows that much has resulted from the breeders in a given community working together. For instance, in England we find many of our leading breeds of live stock developed in local communities. The early development of the Shorthorns took place in the Valley Tees, and the Herefords in the County of Hereford. On the islands of Guernsey and Jersey, laws were passed prohibiting the use of any other stock for breeding purposes except the breed belonging to that island. In France, we find the Percheron horse highly developed in La Perche, and the farmers and breeders of small means co-operating in order to advance the interests of their favorite breed.

"There are many advantages resulting from this co-operation. In the first place, it stimulates the breeders to produce animals of better quality. These stand out as object lessons to the neighboring farmers, thus in time increasing the demand for improved stock in that community. As soon as a community gets interested in one breed of cattle, they become interested in building up a reputation for their county and locality. This co-operation enables the small breeder to get a start, and to find a ready market for his surplus males. Where farmers will agree to co-operate, it is not necessary to keep a bull for instance on every farm, unless the herd is large enough to justify the expense of feed, labor and risk involved. By several farmers clubbing together, putting their money into one superior animal, they will be able to greatly improve the stock of that community without materially increasing the expense. Some farmer centrally located can be designated as the proper person to keep the bull, and to receive a fixed sum for him for his feed and care. A charge (say 50 cents or a dollar for those financially interested in the bull) should be made for each animal bred, to cover this expense. After this bull has been kept two or three years, and has proven a superior breeder, he can be sold to, or exchanged for one from a similar group of breeders, and in this way a valuable animal may be retained in the neighborhood. Where several large breeders or groups of breeders are located near together, it is possible for them to appoint a committee to visit several stock farms and select all the bulls necessary for their community of the same general type and character. These can be exchanged among the individuals or groups of individuals as often as occasion demands.

"Take, for instance, a community where Shorthorn cattle predominate. Why should not those interested in Shorthorns, including all who intend to use purebred Shorthorn sires, gather together, form an association with the determination to drive the scrub bull from the community. In other words, they would bend all their energies in making their community a Shorthorn centre, which would attract buyers of Shorthorn cattle because it would give them a chance to select from a large number or to purchase in carload lots. If a buyer goes to a breeder in the community and does not find what he wants, he is referred to a neighbor; or if he wants several animals, he is referred from one breeder to another until he gets what he wants. Usually a buyer is willing to pay more money for animals when he can buy them near together than when he has to pick them up one by one from a large area.

"Not infrequently it is desirable to develop some special quality as constitution or prolificacy in a

breed of animals which requires careful selection from a large number of individuals. This is made possible when a community is devoting its energies to one breed. When a good animal has demonstrated his superiority in stamping upon nis offspring those qualities which are desirable to perpetuate, he can be retained in the community during the period of his usefulness, and selection can be made from a large number of his own get which possess the special qualities desired.

"An example of the value of the community working along one line is well illustrated at Lake Mills, Wisconsin, where the farmers and breeders are devoting their energies to Holstein-Friesian cattle. Over $100,000 worth of grade Holsteins are shipped out of Lake Mills annually. Counting the value of the purebred produced, the total income for stock in that community amounts in round numbers to $200,000 per year. When a scrub cow sells from $35 to $45 the grade is selling from $60 to $80. Twelve-months-old heifers are selling as high as $30 apiece. During a single year from forty to fifty carloads of grade Holstein cattle left this community for Mexico. One buyer is reported to have purchased during the last few years as high as 800 head.

"In a similar manner Guernseys are being pushed at Wausau, Wis., where recently a carload of grade Guernseys sold for $75 per head and another carload for $72 per head.

"An illustration of the power of co-operation in another line is shown in the Wisconsin Experiment Association, an organization formed by the Short Course graduates of the College of Agriculture. The members of this association unite in their efforts to raise and distribute purebred seeds. They have succeeded in spreading over the state a variety of corn that has far exceeded the corn previously grown in Wisconsin. In like manner they have disseminated good varieties of barley, oats, and other feed crops. The organization now numbers 1200, and is a great power in the state. A young man joining this organization is furnished a small quantity of improved seed. As soon as he produces more than he wants for his own use, he has an opportunity to sell through the association, at good prices, for seed purposes. The influence of this association is felt upon the neighboring farms, as these young men furnish object lessons for the entire community. When a farmer sees a field of barley or oats that is doing exceedingly well upon the farm of these young men, he begins to inquire where the seed came from, and how he can get seed of that quality.

"This same power and influence may be exerted with those who handle live stock. If our stockmen will only unite and maintain a steadfastness of purpose, there is no telling what great results may be accomplished. One man may not amount to much by himself, but when twenty, thirty or a hundred men get together for a definite purpose, there is no measuring of their power and influence in a community.

"Those interested in the subject matter of this paper may desire to have an outline of a constitution and by-laws wnich may serve as a basis for an organization of this kind. The constitution and by-laws submitted herewith is a modification of one worked out by the Animal Husbandry Department of the University of Wisconsin after a study of the workings of various breeders' associations in the state. It is offered merely as suggestive and should be modified to meet the needs of the individual associations. The constitution and by-laws should be made as simple as possible.

CONSTITUTION.

We, the undersigned, farmers of ———— County, do join together for the purpose of advancing the live stock interests of our county (or community).

Article II.—Object. The object of shall be known as the ———— Breeders' Association (or Farmers' Club, if it is desirable to enlarge the scope of the work to include improved seeds and forage crops or other interests.)

Article 11.—Object. The object of this Association shall be to promote the breeding and improvement of high grade and purebred live stock in ———— County (or counties), and to aid its members in buying, using and selling first-class animals.

Article III.—Membership. Any farmer in the neighborhood, with his wife, sons and daughters, or hired man, interested in the object of the Association, may become a member upon the payment of the prescribed annual dues.

Article IV.—Officers. The officers shall consist of a President, Vice-President, Secretary and Treasurer, elected by ballot, and to hold office for one year.

There shall be an Executive Committee of three members, appointed by the President, who shall have charge of the affairs of the club, plan its meetings, arrange its programs, provide speakers, and transact any business that may be desired by the club.

BY-LAWS.

Section 1.—Meetings. The club will hold its meetings weekly or monthly, and its members may vote from time to time, either at ———— school house or at the homes of the members, as club shall elect.

Persons not members of the club may participate in the exercises, but shall take no part in any business transactions.

Sec. 2.—New Members. Any person upon recommendation of a member, and accepted by the Executive Committee, shall become an annual member upon paying the Secretary the regular annual fee.

Sec. 3.—Dues. The membership dues shall be ————, payable annually to the Secretary of the association.

If the funds of the club shall at any time be exhausted, additional funds may be raised by assessment, a majority vote being sufficient.

Sec. 4.—Amendments. The constitution and by-laws of this club can be changed on one month's notice by a two-third vote of the members present.

Sec. 5.—Rules of Order. The usual rules of order for sdch organizations shall govern in the conduct of the affairs of this club.

"In order to start an organization of this kind, it is necessary that two or three interested parties get together, map out a program, announce a meeting in the schoolhouse or other appropriate place, arrange for one or two pointed talks on the object of the meeting, and then have the farmers vote on what breed or breeds they will decide to push in their community. If the interests are divided and no one breed predominates, it is possible to have two or even three successful breed associations in the county or community.

The improved stock breeders of Kansas have done a great work in educating the farmers of the state to know the value of good live stock, and the educating process must be continued until the scrub bull, the scrub stallion, the scrub boar, the scrub ram, and even the scrub rooster shall be driven from every county in the state. I can conceive of no single movement that will bear greater fruitage than working up a local interest and a local pride in some breed of improved live stock." —Prof. O. H. Otis, before Kansas Live Stock Breeders' Ass'n. 1908.

Our Prince Edward Island Letter.

Editor Maritime Farmer:—

Fine, warm weather during the last week of July has given farmers a chance to harvest the heaviest hay crop we have grown in the Province since 1901, which was also a very early season.

This is, indeed, the busiest season of all the year and as the feeding value of the hay crop is so much influenced by the condition in which it is housed, every effort must be put forth to take advantage of what clear weather is granted us as it certainly pays to make "hay while the sun shines." The hoed crops, too, all need close attention. Dairy cows and other stock must be stabled and fed some soiling crop. Potato bugs, horn flies and every other pest known in the country are doing their very worst just at this busy season, and I often think this is the time when the executive ability of a farmer, if he has any, is plainly shown, by the way he manages his work so that everything is kept doing its best as far as he can control it.

Too many of us are inclined to undertake, or as the slang phrase has it, "bite off more than we can chew" and on the vast majority of farms more help could profitably be employed. Often do we see fields of potatoes at this particular season of the year, being ruined by the bugs, the owner well aware that the crop may be from fifty to one hundred bushels per acre short in the fall, through the neglect that would now cost not more than a few dollars. Weeds get a start in the turnips and corn that will lessen the harvested value of these crops many times more than the cost of labor, at this season, to clean them besides lessening the future detrimental effect that weeds, etc., will have on the earning power of the farm.

Farming is surely a complicated profession, and in no other vocation can there be greater scope for good judgment and demonstration of sound business methods, than in the intelligent application of labor. Just how much help it really "pays" us to hire, or what kinds, and cost of machinery it "pays" to purchase are worthy of serious considerations.

Few there be but will admit, that rather than have a valuable crop spoiled it certainly would pay to hire at any reasonable cost enough help to properly save it. Yet we continually see fields that are being neglected through the excuse that it is impossible to give the necessary attention just now, when these same men will agree that it would have paid them many times the cost of the labor to have done it. This question of hired help is one that many of us are not consistent about. If it really pays to keep more help then we, certainly should. Wages are lower here than in any Province in the Dominion and consequently a large number of our population, yearly leave us to take up this work in other parts of Canada. The same might be said about farm machinery. Agents will give you figures to prove that almost every machine they have to offer will be a good dividend paying investment and providing the purchaser has the raw material sufficient to warrant the investment, and he continues growing or distributing this as the case may be, each and all of these machines will pay for themselves. But, the trouble is that all of these things must be paid for long before they earn their cost unless it is a case where they are jointly or largely used. Few will properly look after their machinery so as to get the longest service out of it, not only as to the housing, but as to the keeping in repair. All farm machinery would have double the life if it was gone over each season by some person who thoroughly understood it, and seen where many things could be tightened and thus fulfil the proverb "a stitch in time saves nine."

Just now, the cultivator is the machine that should be kept going as often as possible, especially after a shower of rain.

All our farm crops at this writing, August 4th, with the one exception of potatoes and perhaps corn, look better than we have ever seen them at this season. Hay is unusually plentiful and is being offered at ridiculously low prices to the local trade, mostly by farmers, who seldom have any surplus and don't seem to appreciate how this crop could be turned into live stock or their products and increase the valde of their next year's crop as well.

Grain will be a splendid crop and is standing up well. Turnips are growing very fast. Corn, which had a set back during the damp, cool weather of June is now pulling fast and pastures are ideal. Apples will be a fair crop also, and the fruit and other trees have made a most wonderful growth due to the moist season. Altogether this promises to be the best, or one of the very best, season's this Province has ever had.

W. M. LEA.

Victoria, P. E. I.

Finds Valuable Ideas In The Maritime Farmer.

Editor Maritime Farmer:—

I am very much pleased with your farm paper as I find good advice its pages. For instance:—"Butter Defects and How to Correct Them," written by Prof. M. Michels, of the University of Wisconsin, in your issue of July 26th, also the value of Underdrainage in your issue of Aug. 9th. It is very important that the farmer should properly drain his land in order to get good results from his labor.

Farming in the Maritime Provinces has undergone a radical change in the last number of years. I can remember when the grain crop was first and the dairy was a secondary consideration, now we find the reverse is the condition. There has been high, sandy loam and grow good no doubt, too much grain sold off the farm instead of feeding it to the stock to better enable the farmer to improve the soil without requiring to use so much commercial fertilizer as is used to-day. ...

I follow a rotation of crops on high sandy loam and grow good crops. Barnyard manure is all the fertilizer I use. Never used anything else.

Yours for improvement,

FRANK L. WILMOT.

THE MARITMIE FARMER

And Co-operative Dairyman.

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

THE CUBAN POTATO TRADE.

The Cuban market as a source of disposing of some of the surplus potato crops of Maritime Canada has in recent years, been receiving considerable attention. In the June 24th issue of the Trade and Commerce Report, Mr. E. S. Kirkpatrick has the following :

"The monthly report of the Department of Trade and Commerce at Ottawa for March, recently published, gives a condensed report of the total volume of Canadian trade with all countries during the past fiscal year. Of 36 countries, apart from British possessions, for which returns are shown, the little country of Cuba has a good record, taking seventh place among these foreign countries to which Canada had an export trade, while for the month of March it occupies fourth place. By including as well British possessions, making a total of 48 countries, Cuba takes twelfth place for the year and eighth place for the month of March. The returns show an aggregate increase of trade for the year between the two countries of 23 per cent of $429,730 of which amount the increase in exports was $334,374.

"Of the Canadian exports to Cuba, the greatest increase for the year has been in potatoes, the total shipment for the year amounting to $605,893, or almost half of the Canadian exports of potatoes to all other countries combined. The increase over the preceeding year amounted to $103,834. This does not show the increase in volume, as the prices have been, on an average, from a third to a half lower than those of former years, so that the increase in quality is proportionately greater.

The statement has been made that it is folly for the Canadian farmer to look to the Cuban market as a profitable one for potatoes, and the prevailing prices of the past season are quoted as evidence. The fact, however, remains that, when last year's potatoes were planted, very few Canadian farmers had ever thought of the Cuban market. The prospect of such, therefore, had no bearing whatever on the acreage planted. But it was supposed, as in other recent years, the home market would be a profitable one. It is equally certain that, had it not been for the Cuban market, which absorbed such enormous quantities when the home market failed, potatoes could not have been sold at any price in Canada. The low prices were due to over-production both in the United States and in Canada, and it was only the low prices quoted in Canada which prevented United States shippers from flooding this market with their surplus, enjoying as they do the advantage of a preferential tariff.

"To illustrate the close competition between the two countries for this market, it might be stated that one buyer recently found that on an increase in his freight rate from Canada of but ten cents a barrel, he could land potatoes in Havana from the Boston market cheaper than he could from Canada. Throughout the season United States shippers made every effort to capture the market, quoting lower and still lower prices until they were being offered here at $1.50 ber barrel c.i.f. When this figure was reached it appeared at this office as though it would be impossible to make shipments. A report was therefore sent to the department to this effect. But although the price dropped further to $1.40, and the New Cuban crop was on the market, Canadian potatoes still arrived in undiminished quantities, and are still holding the market to the exclusion of all others from foreign countries.

"The past season has been largely an experimental one, for it is certain that but very few of those who found a market here had had any previous knowledge of Cuban trade. Undoubtedly many errors resulted in consequence. It has demonstrated, however, many valuable points. First in importance is the fact that Cuba offers a safe and ready market for many of the products of Canada which fact cannot be too strongly emphasized. It has further shown the importance of frequent steamer sailings, without which no progress could have been made. With the growth of the trade the service must be developed still further until it is on a par with those operated from other countries doing business here. Cold storage facilities will be essential, and when such are provided an excellent market will be available for dairy products, eggs and fruits. The manner in which apples have been shipped here from Canada in the past has been a farce, and there is an excellent field here for those who cater to the market in an intelligent way. If the tourist travel from Cuba were sought, a considerable part could be secured. At the present season the New York boats are so crowded that reservations have to be made weeks ahead.

"There is no question that many of these people would spend their summers in Canada if they were offered any inducements. Some other points which might be mentioned are : that the trade of Canada with Cuba is not limited to the winter season but may be continuous throughout the year ; that potatoes when properly handled may be shipped here in bags as well as in barrels and will command an equally ready market at a considerable saving in expense ; the proper shipping papers are absolutely necessary in order to save delay and expense ; and that an intelligent co-operation on the part of exporters would do much to create better prices and more profitable returns.

"An important point to be borne in mind is that the bulk of the imports in Cuba are handled through the medium of commission firms and brokers. In probably no other country will there be found such a large percentage of such firms.

Of the various exports which Canada sends to Cuba, it is safe to say that 95 per cent is handled through brokers, and it is impossible to deal with the big importers in any other way under present conditions. Commercial travellers coming here almost invariably get in touch with a brokerage firm and do their business through them. It is most important that the exporters of Canada secure the the best possible and work through them, as it will be found to be a waste of time to try to do business in any other way.

REACTION IN FAVOR OF THE FARM.

To observant people it is manifest that a healthy reaction has been going on in the popular mind regarding the pursuit of agriculture. The evils produced by overcrowding of other occupations are beginning to be appreciated and farming to be dignified by the light which science is shedding upon it. To be a good farmer now requires more than mere unenlightened patient drudgery. The calling demands knowledge, constant study, patient experiment and tireless industry. The farmer feeds the hungry of all classes ; he deals in commodities which must be purchased. He is the most independent man of the present age. There was a time when a successful struggle for simple existence satisfied the tiller of the soil ; but science, with her schools and colleges, railroads, telegraph and steam boats has made vast changes. The glitter and tinsel of cities, the imaginary honor of the professions, the apparent ease of accumulating wealth in commercial pursuits on the one hand, and the snail-like, hum-drum, hard work life on the other, have driven many young aspiring men to forsake farming for some more progressive occupation. No avocation in life is more exaulted and pleasurable, and no other is more scientific if properly pursued—not one is more conductive to health and happiness ; no calling will tend to unfold more fully the whole capabilities of body and mind, or to deepen convictions of an all-wise Creator. But to succeed at the present time, he who engages in it must listen to the teachings of science and experience as recorded by wiser men than himself. Then, with sound judgment and an honest pride in his calling, the farmer may exalt his avocation, and in turn be himself exalted. The son himself will gladly follow in his father's footsteps, and the daughter will delight to grace the home of comfort and happiness on the farm. To make farm labor honorable, pleasant, and profitable, by making it intelligent, should be the aim of of every true Canadian farmer. The farmer must do his individual part in meeting the world's demand upon his country. In no way can this be done to better advantage than by storing his mind with knowledge bearing upon his calling. Since the object of human labor is to bring enjoyment, the sooner the farmer learns to accept every advantage offered him the sooner will rest and comfort come to him.

A GOOD FARMER.

The term a "good farmer," should be as much appreciated as a good lawyer, or a good doctor or a good teacher. To succeed at any of these, knowledge of the profession and skill in performing the duties appertaining to the work is required. Few will deny that farming requires skill, industry and perseverance. Then why is it not as much honor in being a good farmer as it is a good professional man? There are many reasons why a good farmer should be honored. Generally speaking progressive farming requires more skill and intelligence than the average professional calling.

INDUSTRIAL VIRTUE.

One hour of good, honest work is worth more to keep a boy straight than two hours of admonition. Industry is a wonderful promoter of personal integrity and the consequent piece of society. The idea of the trade schools, a place where the boy or girl shall educate the hand as well as the head, reaches straight back to the promotion of the moral sense, as well as other things. It would be an interesting fact, to know how many of the confined criminals, who are confined in our prisons, had ever acquired a trade. Preachers and teachers have not yet well understood the moral regeneration that comes from work.

EDITORIAL NOTE.

"A man should never be ashamed to own that he is in the wrong, for it is but saying in other words that he is wiser today than he was yesterday.'

Concrete on the Farm.

Concrete for many years has been in use in Canada and other countries for large structures, such as bridge abutments, piers, breakwaters, arches, etc., but only within the last few years has it been used extensively for construction work on the farm. The scarcity of wood and other building materials makes building on the farm today a different proposition than that of 20 years ago. In many localities, where twenty-five years ago, timber was abundant, today there only remains a few straggling trees which adorn the lane-ways and groves on now well-cultivated farms. In those days the progressive farmer could always get pine, hemlock or other suitable material within a few miles of the place where the same was required for use and number one pine could be purchased for at from $8 to $10 per thousand, which now would sell for from $40 to $60 per thousand.

Within the last fifteen years the manufacture of cement within our own province has become an extensive industry. Production on a large scale and competition have been the means of placing cement within easy reach of every farmer in Canada and at a cost that would warrant its use, in every class of work where it would be practical to use concrete in place of wood or other building materials.

TERM CONCRETE EXPLAINED.

The term concrete might apply to any kind of plastic materials which have been hardened together in one solid mass, but in treating on concrete under this head, we refer to what is known as cement concrete, which may be made from or by the use of several different materials for coarse aggregates, the same having a proper amount of cement added to form a perfect mixture, and cause the whole to set into one solid crystalized mass.

Use only Portland cements. The term Portland applies to cements which have been placed through a certain process of manufacture, and at the same time have been treated chemically or otherwise, according to a specification. All cement which has been treated under this specification may be termed Portland cements. We could specify for use no one certain brand of Portlands, as where all have been treated under practically the same process, there cannot be any great difference in the quality of cement produced by different makers.

MAKING CONSRETE.

In the making of concrete any of the following coarse aggregates may be used: Sand, gravel, broken stone, slag, cinder. Different classes of work call for the use of different kinds of coarse aggregates, but speaking of concrete as that generally used on the farm, we would apply to concrete made from cement sand or gravel properly mixed together.

1st. Build a platform about 12 ft. square, of 1 inch matched lumber. This 1 inch lumber should be securely nailed to 2-4 scantling 12 feet long, placed about 2 feet 6 inches apart, at right angles with the boards.

2nd. Place the mixing board on the level ground.

3rd. Prepare a square frame. The size of this frame depends on the amount of concrete to be mixed at one batch. For example, we would presume that we desired to make a 1 to 8 mixture. This frame should be made in size to hold 8 cubic feet of sand, which will be mixed with one bag of cement representing 1 cubic foot. For this size of batch the most convenient size of frame would be 3x4 and 8 inches deep. Should it be desired to mix larger batches, the frame might be made wider, but it is not advisable to have the frame in any case more than 10 inches deep.

4th. Lay the frame on the centre of the mixing board, the long way of the frame to lie at right angles with the lumber in the mixing board, this will prevent the shovel from tearing slivers from the mixing board.

5th. Fill the frame half full of sand and level the same with a shovel.

6th. Add one-half bag of cement. Spread the same evenly over the sand.

7th. Fill the frame full of sand or other coarse aggregates to be used. and once more level the top of the same.

8th. Add the remaining half bag of cement. Spread evenly over the top of sand.

9th. Remove the frame, which will leave the ingredients lying in a long pile on the mixing board.

10th. Start at one end of the pile and turn the same over completely three times, each time the same should be turned into a pile of conical shape.

11th. Spread out on a board about 8 inches deep and sprinkle with a watering can, then turn over two or three times more and the concrete is ready for use.

WATER NECESSARY.

The amount of water required for concrete depends upon what the concrete is to be used for. It is generally admitted that concrete having sufficient water to make the same thoroughly moist is better than that made from a very dry mixture, and on that account it is always well to use wet concrete in every kind of work where the same is practicable or for such work as cement silos, stable floors, abutments, retaining walls, watering troughs, or any class of work where the mould has not to be removed immediately.

In speaking of wet concrete, we would refer to concrete having sufficient water added that after the same has been tramped into the mould the water will just begin to rise to the surface. An excessive amount of water will cause the cement to rise to the surface and thus injure the concrete.

In speaking of dry concrete, the term applies to concrete having only sufficient water added to moisten the surface of all particles. This mixture in appearance will resemble wet earth or if a quantity of dry mixture is squeezed in the palm of the hand the same will compress into one solid mass but will not adhere to or moisten the palm of the hand. This kind of concrete is used for such work as the manufacture of concrete block, concrete brick, concrete tile, or any class of work where it is necessary to remove the mould immediately.

Concrete is used extensively on the farm for such work as building cement cisterns, cement walks, cement floors for stables, barns, barn walls, foundations, and is always used very extensively for buliding dwelling houses in the form of cement brick and block.

CONCRETE BLOCKS.

Concrete blocks are now being used extensively for building barn foundation walls, and for dwelling houses throughout. Many improvements have been made in machines for manufacturing blocks in the last few years. The latest machine is that which might be termed the Face-Down Machine. The face down principle allows the block to be faced with richer material or colored. The face of a block is usually made of a mixture of one part cement to two parts of sand, then the body of the block is made of coarser material of poorer proportions. This method of manufacture makes an absolutely water proof block. This type of machine also provides for the stone to be made in any size or design and thus meet every architectural requirement. On account of sand and gravel being plentiful in most localities, the manufacture of concrete blocks on the farm is becoming an extensive business.—O. A. C. Review.

Attaching Gasoline Engines to Separator.

The following article on "Attaching Gasoline Engines to Cream Separators," appeared in a recent issue of Hoard's Dairyman and will be interesting reading for all those who purpose putting this labor saving device in their dairy:—

"In a recent issue a party asks about attaching a gasoline engine to the cream separator, and is advised to get detailed information from the agents. As selling agents are sometimes so desirous of making a sale that they will sometimes stretch a point, their advice is apt to be misleading. At least I know of one such instance where the farmer bought the engine on the strength of the agent's recommendation that it could be stationed in the small milk room in the barn where he did the separating. The party knew little about gasoline engines at the time and taking the agent's word, ordered the engine, thinking that it could be stationed in the small room in the barn. When the company's expert came to set the engine up, he soon ordered a different place, and the result was that it had to be set out-of-doors and a building erected over it. So one cannot always place strict reliance upon agent's claims and must accept their advice with a pinch of salt.

A gasoline engine may be stationed in any milk room that is large enough, and it does not require a very large space. One should provide a solid foundation, preferably of concrete for both the engine and the separator. The engine cannot be connected direct to the separator, but must be operated through a line shaft. A belt from the driving pulley on the engine turns the line shaft, and the line shaft must have a proper sized pulley to connect with the separator. While there is no danger from fire with a gasoline engine in the barn, yet insurance companies have certain restrictions and charge extra insurance. Before buying, it is a wise plan to consult the insurance company and make sure that the type of engine is an approved make. The supply tank, from which the gasoline is pumped by a pump on the engine, must be at least 50 ft. away from any building.

In getting the pulleys for the line shaft one must take into consideration the driving pulley on the engine and the pulley wheel on the separator. The speed of the engine is generally at a fixed number of revolutions per minute and the speed of the separator must be regulated entirely by the size of the two pulleys on the line shaft. One general rule to be kept in mind: If the diameter of the driving pulley (or the one on the engine) is the same as the driven pulley (the one on the line shaft) the revolutions of the driven pulley will be the same as the driving pulley. If the diameter of the driving pulley is less than the driven pulley, the revolutions of the driven pulley will be decreased; and if the diameter of the driving pulley is greater than the driven pulley, the number of revolutions of the driven pulley will be increased. In other words, if the driving pulley on the engine is a nine-inch pulley making 360 revolutions per minute and connects with an 18 inch pulley on the line shaft, the speed of the shaft will be less than that of the engine, or 180 revolutions per minute as the speed varies in proportion to the diameter of the two pulleys. The same mathematics applies to the pulley on the shaft which connects with the one on the separator, except that instead of being the pulley driven it is the driving pulley.

A simple rule for finding the number of revolutions of the line shaft per minute, is to multiply the diameter of the engine driving pulley by the number of revolutions the engine makes per minute, and divide the result by the diameter of the driven pulley on the shaft. For example if the engine pulley is a nine-inch making 360 revolutions per minute and the one on the shaft is an 18-inch:

$$\frac{9 \text{ (dia. of engine pulley)} \times 360 \text{ (rev. per m.)}}{18 \text{ (dia. of shaft pulley.)}} = \text{equals 180 revolutions of shaft}$$

The pulley on the shaft may be of any size, but it is desirable to reduce the speed at least half for separating, which is done by getting a pulley twice the diameter of the one on the engine.

Now the separator must be turned at a certain number of revolutions per minute and the problem must be worked backwards. If the pulley on the separator is a 12-inch and must make 50 turns per minute, and the revolutions of the line shaft is 180 per minute, we must find what diameter of the line shaft pulley will run the separator at the required speed. A simple rule for finding this is to multiply the diameter of the separator pulley by the number of revolutions it must make per minute and divide the result by the revolutions the line shaft makes per inute. The answer will be the size pulley required. For example, the separating pulley is a 12-inch and must make 50 revolutions per minute, and it has been previously learned that the line shaft makes 180 revolutions per minute:

$$\frac{12 \times 50}{180} = 3\tfrac{1}{3} \text{ size of pulley required.}$$

This pulley generally has to be made special as it is apt to be an odd size. One cannot substitute the next size to it, either larger or smaller, because it would change the speed of the separator which is never advisable if thorough work in separating is expected.

The belt from the shaft to the separator should be loose so that the separator will be put under motion gradually. The engine starts out at full speed, but the belt connecting the separator being loose, slips and starts the separator as evenly and slowly as one can do it by hand, and when once started maintains the speed at a uniform unvarying motion.

A gasoline engine is a wonderful help in separating, doing the work cheaper than one can hire it donr or afford to take the time to do it himself. It is not a difficult task to attach it to a separator and may be done by anyone possessing ordinary mechanical ability. The main points are to have solid foundations for the engine and separator, a line-shaft on which are the proper sized pulleys and a loose belt for separating. Other pulleys may be put on the shaft and these connected with the churn, pump, or mill machinery.

LYNFORD J. HAYNES.

Pennsylvania.

Dysentery is a dangerous disease but can be cured. Chamberlain's Colic, Cholera and Diarrhoea Remedy has been successfully used in nine epidemics of dysentery. It has never been known to fail. It is equally valuable for children and adults, and when reduced with water and sweetened, it is pleasant to take. Sold by all dealers.

HORTICULTURE

The Pre-Cooling of Fruit for Shipment.

The so-called pre-cooling of fruit, vegetables, or other produce, consists of an arrangement whereby the circulation of air which is chilled with a refrigerating machine, is directed through a loaded car by means of temporary and adjustable pipes or ducts. That is to say, the car is placed in the same relation to the refrigerating machine for the time and trouble. It would take too in a cold storage warehouse.

My attention was first drawn to this system by the work of the bureau of plant industry of the United States Department of Agriculture in California where they experimented in connection with the shipment of citrus fruits and vegetables in conjunction with the Pacific Fruit Express Company, a subsidiary company of the Southern Pacific Railway system, and by correspondence with Mr. L. A. Roy, of Chicago, who is interested in the promotion of the idea.

Two years ago I fitted up the necessary connections at the St. Catharines Cold Storage and Forwarding Company's warehouse, but we were never able to give it a fair trial on account of the small size of the plant. The partial cooling which was affected was undoubtedly of some benefit, but hardly worth the time and trouble. It would take too long with the six ton machine in use there. The pre-cooling of a car load of warm fruit, in addition to the chilling of the car itself, which is a considerable item, takes about two of refrigeration and as it should be accomplished in about four hours, it is equal to a machine capacity of twelve tons in twenty-four hours. If two cars were to be cooled at one time, it would require a plant of at least twenty-five ton capacity. Further, in order to be effective, the cold blast should have a temperature of not more than twenty to twenty-five degrees and that precludes the possibility of using the same circulation in the warehouse where the temperature in the fruit rooms must not go below thirty-two degrees. As long as the fruit in the car is warm, the cold air blast can safely be reduced to several degrees below the freezing point, but this is not permissible in a warehouse where the contents are already reduced to the minimum of safety.

During the summer of 1909, I had an opportunity of inspecting the large plants which have been erected by the Southern Pacific Railway in California. They have spent $1,500,000 on two plants, one at Roseville in northern California and the other at Colton in the southern part of the state.

These two plants are at interior points where the traffic converges for the overland journey. The one at Colton has 500 tons of refrigeration and can handle a whole train of cars at one time. In addition to the cooling facilities, there is a large equipment for making the ice with which to fill the bunkers of the cars.

You will observe that these cooling facilities are being provided in California by the railway company and I am of the opinion that it properly falls to them to do it. In the first place, they benefit by the saving of ice, and a plant erected by by the railway can be made to serve a whole district at very less cost than the aggregate cost of erecting a number of small plants. Moreover, it should be the business of the railways to carry the freight which is entrusted to them in the best possible manner and, if pre-cooling comes to be one of the necessary aids to the transportation of Canadian fruit, it seems to me that it is up to the companies to furnish it.

I can see the possibility in the future, or I might say the practicability of operating a plant, say at Hamilton, to serve the district between Niagara and that city in connection with western shipments. With some system of prompt movement of the cars from loading points to the cooling centre, they would be started on their overland journey without serious delay and with the best possible chance of reaching their destination with the contents in good condition.

It will be evident from what I have said that pre-cooling does not differ in principle from the cooling which is effected by placing the goods in a cold storage warehouse, but if it is conceded, and it certainly may be, that immediate and rapid cooling is important in the handling of perishable produce, then it must be admitted that, under certain circumstances, pre-cooling has decided advantages. One advantage over cooling in a warehouse is that it saves handling the fruit and the consequent exposure to warm air while being transferred from warehouse to car, a thing to be avoided as much as possible. With proper equipment, a car-load of fruit may be cooled in this way as much in four or five hours as it would be in two or three days with ice only in a refrigerator car. A more rapid circulation of air at a much lower temperature than can be secured with the use of ice removes the heat in a comparatively short time.—From an address on "The Cold Storage of Fruits," delivered before Ontario Fruit Growers' Association at its last convention, by J. A. Ruddick, Cold Storage Commissioner, Ottawa.

Selecting and Exhibiting Fruit at the Fall Fairs.

A very common expression overheard at our exhibitions is "I am sorry that I did not show some of my Baldwins or Northern Spy apples. I am sure they would have taken the prize as they are finer than these shown." The same in vegetables, grain and other products of the farm—sometimes the regret takes an acute hold of them and they make the effort and show next season, but in too many cases the desire may exist, but they forget or are indifferent till too late and another exhibition comes around with the same futility of effort and the same regrets at not showing. Again it is to be noticed at many fairs that certain exhibitors take all the prizes every year, not that they have any better fruit or more varieties than their neighbors, but simply they have got the habit, have broken the ice by deciding to show, may have fared, but indifferently the first year, but they gained information, got experiences as it were learned the requirements, made better selections with consequently more success thereafter.

It is impossible to estimate the educational benefits to be derived from a fall fair in any line of occupation. We are here shown the highest and greatest results and the consequent stimulus will last indefinitely and leaven one's whole future.

The determination to exhibit should be made early in the season, and a careful eye cast on prospective exhibits. Frequent inspection, looking for promising specimens of apples, for instance, is a most interesting and pleasureable of employments, instruction by observation and beneficial in results. It points out to the farmer or fruit grower errors to be corrected, suggests improvements to make, discovers insects and destructive pests, points out where pruning should be made in season, and in fact reveals by the critical survey the whole condition of affairs, good, bad and indifferent.

Here then we see already the influence for good expected by the fall fair in thus simply preparing for for it. To have the best fruit induces careful cultivation by the

"WINNER" WASHER.

Designed for quick and effective work. Cover to keep in all steam. All Gearing covered. Heavy fly wheel to do the work. Made of Louisiana Red Cypress. Don't be without this machine for another washday. Cost is trifling in comparison to results.

grower. To win the prize for the best plate or the best bushel or the best barrel of Greenings the farmer takes to draining his orchard, to manuring and fertilizing, to pruning and thinning the fruit. Following up these methods he benefits his whole crop and reaps an hundredfold in credit to his industry and intelligence—he rises in the esteem of the residents of the locality. The winning of the first prize is far reaching in its results. It may be but nominal in value, but it is an incentive and a stimulus to the winner. He becomes a subject for discussion, his movements are to be copied, and methods imitated.

The following points are to be considered in selecting fruit: First size, second color, third freedom from speck or deformity. When gathering be careful to leave stems on and to secure this, seize the fruit by the stem, giving it a slight twist. Handle carefully in a basket and place on a table in rows. Have plenty of the best to select from and have specimens of an even size. It pays, when packing for the show, to wrap each specimen up separately in some paper to prevent bruises. The largest and finest fruit are grown on the young trees just coming into bearing, but good fruit can always be had on old vigorous trees.

As prizes are usually given for dessert, fall and cooking fall—Winter dessert and Winter cooking, the following varieties of apples are usually shown:—

Dessert Fall.—Gravenstein, St. Lawrence, Ribson Pippin, Jersey Sweet, Autumn Strawberry.

Fall Cooking.—Duchess, Colvert, Twenty Oz. Fall Pippin, Blenheim Orange.

Winter Dessert.—Snow, Spitzenberg, Northern Spy, Swazee Pomme Gris., American Gold Russet.

Winter Cooking.—R. I. Greening, Northern Spy, King Tompkins Co., Baldwin, Yellow Bellflower, Newton Pippin.

The foregoing list embraces 20 vgrieties, but many big orchardists may have double that number with profit. When close to good market, early varieties as Early Harvest, Red Astracan, Duchess and others may be grown profitably, but for shipping purposes the fewer varieties the grower has the better. For showing purposes as well as to see how they flourish in the neighborhood and as alternate varieties in off bearing years, it is well to have a good assortment of kinds.

Some exhibitors of fruit take great pains to polish and shine the fruit up—a practice praiseworthy and allowable on a fruit stand, but never should be practised when competing for a prize. To an experienced judge this is prejudicial to the exhibit, as it destroys the natural bloom of the fruit, one of its particular charms.—J. McPherson Ross, in Canadian Farm.

Growing Apple Trees From Seed.

It seems to me that the horticulturist has the opportunity of getting more enjoyment out of this brief and uncertain life than those engaged in almost any other avocation, and as his joy is mingled with his work he becomes an artist after the style of Gideon, Harris, Patten and a large number of others who have made themselves such benefactors to their fellow men, not only to horticulturists but to the people of the entire world.

He not only puts joy in his work but he is a philanthropist in every sense of the word, for he has bestowed upon his fellowmen something that could not be purchased by wealth or influence. To me, the propagation of seedling apples or fruit of any variety is one of the most fascinating occupations or pastimes a person can have. If there is anything well known, any fact undisputed among horticulturists, it is that as a rule no tree fruit will exactly reproduce itself from seed. While this is true of all tree fruits, the apple tree is remarkable, in that valuable varieties never reproduce themselves.

The only cases known in pomology where an apple tree is produced the second time from the seed is in cases where they revert back or nearly so to the wild stock from which they originated. Pyrus baccata and all such trees are absolutely without any value whatever except to be used as stocks for grafting purposes.

Plant a bushel of apple seed all taken from, say, the Wealthy. While it would be possible, still it would be highly improbable that out of the whole lot of seedlings you would get a single Wealthy tree. This is true of any given named variety. The absolute facts are, technically speaking, that on planting the bushel of apple seed mentioned, when the seedlings are grown there will be no two trees alike in every respect, and, what is more, there will be no tree that is exactly like any known tree heretofore grown, with the exception of those which revert back to the original stock as before stated. Many valuable varieties will be found among them, but all differing in some way from kinds now grown and classified. Consequently, to perpetuate a given variety, grafting or budding in some form must be resorted to.

To produce hardy apple seedlings where very few apples are grown, sow the seeds of apples produced in the locality or as near to it as possible. Seed sown from apples produced in the South or East produce seedlings that are of no value in this country; this we have tested thoroughly on our own grounds.

Another thing noticed in connection with the growing of apple trees from seed is that an apple seedling that has never been transplanted may be to all appearances quite hardy so far as the old tree is concerned, but when an effort is made to propagate it by grafting, the grafted trees are found to be quite tender. Again we have had seedling apple trees grow until they were 7 or 8 years old, and be to all appearances quite hardy, carrying a few specimen apples, but just as soon as they would come into full bearing, it was noticed the season following that the tree was nearly dead, the effort put forth to mature a full crop of fruit weakening its vitality to such an extent that it would finally succumb. In connection with this matter I might say that experience has taught me that no seedling fruit tree can be classed as quite hardy until it has been grafted in the nursery, come into full bearing in the orchard, passed through a hard winter, then produced a good crop the following summer.

The beginner will now clearly understand that the growing of apples from seedling trees is very much of an experiment and he should be prepared to meet with many disappointments. But there is a great and pressing need for this kind of work in Western Canada. This is a line of work that all those who have succeeded in fruiting the large apple can take part in. Save the seeds and care for the seedling trees till they bear fruit.

In collecting seeds we save the cores of all large apples used, the seeds are removed with a sharp pointed knife, all seeds are sown in the fall if possible, as we can get a better percentage to germinate the following spring. If, however, the

Essentials in Profitable Swine Feeding.

There are a few facts of fundamental significance in the field of swine industry as follows:

First: Swine growers cannot produce the fall litter as successfully as they can the litter that is farrowed in the spring.

Second: Many breeders have repeatedly changed breeds, having tried one breed for a number of years, and not succeeding as well as they thought they might, they have adopted some other breed.

Considering this, in view of the fact that the better one's acquaintance with the breed and the longer the herd is bred and handled in one's hands, the greater should be the success, and in view of the fact that the fall litter is not as successfully grown as the spring litter, it indicates quite clearly that there is something radically wrong or entirely unknown about the system of swine breeding and swine feeding as now practiced.

MAKING OF A HOG.

The feeding of a hog, or in other words, the making of a hog, might be compared to the building of a brick house. If such a house is to be built it requires a certain definite quantity of various materials, such as brick, mortar (made of lime, sand and water), and lumber. Before being able to build such a house the builder must know the kinds of material it requires and the quantity of each kind that is necessary. Likewise, in order to be able to produce a hog successfully the feeder must know the constituent parts of a hog, the amount of each constituent, the character of the feed necessary for the construction of each constituent part, and also the amount of each nutrient or constituent part of the feed that can be handled by the pig to the best advantage for the proper construction of each individual part of the hog.

The hog is made up in general of mineral matter, which is found most largely in the bones; of protein, which is found in the lean meat or muscles and also to some extent in the bones; of fat, as illustrated by the fat cells distributed throughout the fatty tissues of the carcass and the lean meat or muscle; and the water, which is found in all of the tissues, especially in the softer tissues. In round numbers about 50 per cent. of the live weight of the hog is water.

Something cannot be made out of nothing. Furthermore, the animal body cannot substitute indefinitely. While carbohydrate can be used to some extent in place of fat and fat in limited quantities in place of carbohydrate, the animal body cannot make mineral matter out of anything else and neither can it make protein out of carbohydrate, fat or mineral matter, and water also must be supplied and it cannot be made out of dry matter.

MUSCLE OR LEAN MEAT.

If a hog is to develop as it should and make the required amount of fat it must have first, sufficient muscle or lean meat. If it is to have an abundance of muscle or lean meat it must first have bones to which to attach these muscles. If the hog is to have fat, muscle and bone it must also have sufficient water to go with these or else it cannot produce anything. In other words, a hog must be symmetrically fed if it is to develop at all.

The first consideration should be the development of bone. If a hog is not fed sufficient mineral matter it cannot grow otherwise. In an old civilized country mineral matter is not usually as abundant as in a new country, because the soil is more or less robbed of its mineral constituent which is used up as plant food. Furthermore, different sections of the same country and different countries contain different mineral matters of various kinds; and again, as there is no standard for the mineral requirements of swine, there are no set rules according to which mineral matter should be fed. In order therefore to supply this part of the metabolism mineral substances such as common salt, bone meal, or ground phosphate rock, air slacked lime, wood ashes and charcoal, should be kept before the hogs in separate troughs so that they can have free access to it at all times. They will then be able to supply their mineral metabolism according to the dictates of their appetite.

USE OF CLOVER.

In order to furnish the hog with means with which to build up his muscle or lean meat tissue he must be given the required amount of protein in his feed. Protein metabolism cannot be supplied with any other nutrient. A protein feed that is available to the swine feeder for this purpose is clover, which is roughage and cannot be used exclusively as a source of protein except for mature hogs. The concentrated nitrogenous feeds are such as skim milk, soy beans, cow peas or Canada field peas oil meal, tankage, etc. The last two, however, are commercial feeds and should not be used except when absolutely necessary. As for instance, when they can be bought more cheaply than the others can be produced or when the home supply is exhausted.

A great deal of work has been done by the writer at the Illinois experiment station to determine the amount of protein necessary for a maximum and most economical production. This is thoroughly outlined and discussed in station publications of the Illinois Agricultural experiment station, and also in a book by the writer on "Swine Breeding, Feeding and Management."

EASY TO STUNT PIG.

It is necessary to feed the required amount of protein and it is just as important not to feed too much as it is not to feed to little. It is a very easy matter to overfeed a pig on protein so that he will never grow as large, neither make gains as profitable as he would if this had not occurred. Again, it is a comparatively easy matter to feed a pig so much protein that he will become permanently stunted and if he is fed a little more he may actually be killed.

Pigs are usually fed in droves. The smaller the drove the better is the opportunity for an equal distribution of the feeds, and especially the protein feeds, among the individuals of the drove.

In order to get the best results, it is necessary to distribute the given amount of protein feeds to the individuals of the drove as well as it is necessary to give the bunch the right quantity. As a means for proper distribution of nitrogenous feeds it is suggested that these might be ground and mixed with the carbonaceous feeds and water into a slop. If grain is not to be ground and if protein is to be fed in the form of beans or peas, these might be scattered thinly on a pasture so that the pigs are compelled to gather them, and while they are doing this and at the same time masticating them, it is a pretty good opportunity for distribution, especially if the pigs in the drove are not too numerous and are of the same size and age. If these beans or peas can be fed together with the vine the possibility of better distribution

A Boy Can Plow This Way

THIS attachment—these wheels to go under the beam—make it unnecessary to buy a sulky plow to plow comfortably—makes the ordinary plow as solid in the ground as a sulky plow.

The large wheel on the right—18 inches in diameter—runs in the furrow—regulates the furrow thickness and width. The small 12-inch wheel supports the plow when the plowing is too deep and the plow has a tendency to overthrow. The wheels are adjustable independently and have compensating axles to take up wear.

With these wheels, the plow always works at the same depth—the draught is regular and easier on horses—the plowman's work is easier and it is almost unnecessary to hold the handles. They can be put on ANY plow in five minutes. **Write for our Catalog if your dealer cannot supply you.**

The Coupon Brings The Book—Use It

We want to place this book FREE in the hands of every farmer who is interested in the preparation of the ideal and perfect seed-bed—in the hands of every farmer who wants to know about "Soils and Fertilizers." "Plowing and Plows." "Seeds and Seeding."—there is a chapter on each. If you had to buy this authoritative work, it would be worth a dollar; we will send you the volume—one copy—FREE. GAS ON THE STOMACH

Relieved at Once by Father Morriscy's No. 11 Tablets.

Many people find that no matter how carefully they watch their diet and deny themselves this, that or the other favorite dish, still after every meal gas forms in the stomach and everything seems to turn sour.

Besides causing great discomfort, this condition makes it impossible to get the full benefit from the food eaten, and the body is continually starving with a full stomach.

Father Morriscy's No. 11 Tablets promptly relieves this and other stomach disorders. Each Tablet has the power of digesting a pound and three-quarters of food, so that even though the stomach may be in a very bad or weakened condition one tablet taken after each meal will insure proper digestion and prevent sourness, gas in the stomach, pain or discomfort.

The case of Miss Maggie Leahy, of West Franklin, Ont., is a sample of what Father Morriscy's No. 11 Tablets can do. Writing on Jan. 5th, 1910, she says:

"Your No. 11 Stomach Tablets suit my case exactly, as I am ever so much better since using them than I had been for the last seven years. I could hardly eat anything that would not turn sour on my stomach, or cause gas. My Doctor said it was Catarrh of the Stomach. I had no pain, but gas after eating. The first tablet I took gave me relief, and I am still continuing their use."

If you happen to eat a little too much for dinner, or something that does not agree with your Stomach, just take a No. 11 Tablet and you will feel all right in a few minutes.

If you have been troubled with Indigestion or Dyspepsia a course of Father Morriscy's No. 11 Tablets will soon put your stomach into a healthy condition again.

50c. a box at your dealer's, or from Father Morriscy Medicine Co., Ltd., Chatham, N.B. 103

will be still greater. Carbohydrates, such as is found most abundantly in corn, among the common farm feeds is used by the animal body for the production of energy, heat and fat, and must be supplied to the pig in proper quantities, daily, per 100 lbs. live weight the same as the protein in order to get best results. The quantity of this is also discussed in the above mentioned publication.

GROWING AND FATTENING PERIODS.

The life of the market hog for most successful feeding should be divided into two periods, the growing period and the fattening period. During the growing period, when bones as well as lean meat are produced, together with the fat, the pig need more mineral matter and more protein than he does during the fattening period, when he is producing fat more largely, consequently it is necessary to feed more protein and mineral matter during the growing period, and when this is properly done the pig can use carbohydrate or corn successfully during the fattening period in larger quantities proportionately than he can during the growing period.

By supplying the pig the right quantity of mineral matter, protein and carbohydrate it might seem to the casual observer that he ought to develop fairly well because the carcass of the hog as ordinarily viewed is made up of bones, lean meat and fat which, leaving the water out of consideration are made up of mineral matter, protein and fat or carbohydrate. The writer, however, has recently determined that it is just as important for maximum development to feed the right quantity of water and that this should be varied during the life of the growing hog.

It has been shown that the pig at 2 months of age requires twelve pounds of water daily per 100 lbs. live weight, and that this should gradually be reduced to four lbs. when the pig is 8 months old and in prime condition ready for market.

It has also been shown that if the pig is given either dry feed or thick slop and free access to water he will drink too much during the summer and will not drink enough during the winter. Neither condition will be conducive to greatest or most economical gains, consequently it is necessary for most successful swine feeding to feed the right quantity of water as well as of mineral matter, protein and carbohydrate. For further discussion of this subject the reader is again referred to the above mentioned publication.

CANNOT LIVE WITHOUT AIR.

An animal can live for weeks without dry feed, can live for days without water and can live only for a few minutes without air, consequently the oxygen obtained from the air is of the greatest importance as a supply of food. In order to obtain sufficient oxygen to properly metabolize and use the feed that is taken into the stomach, such as corn, milk, soy beans, clover, etc., which furnish the various nutrients like carbohydrate, protein and mineral matter it is necessary that the pig's respiratory apparatus be properly developed and properly used. In order to use this properly it is necessary to give the pigs sufficient exercise because exercise is conducive to respiration.

In order to develop this part of the pig properly it is necessary that he should be bred right and fed right for at least five generations before he is born. In order then to feed a hog properly it is not only necessary to supply him sufficient mineral matter, sufficient protein, sufficient carbohydrate and enough water to go with these, but it is also necessary to see that he gets an abundance of oxygen to properly use up what he takes into his stomach and which is digested and goes and meeting the oxygen that comes into the circulation, coming into the lungs and meeting the oxygen that comes into the lungs by means of the nose.

WHY FALL PIGS FAIL.

One of the main reasons for the lack of success with the fall pig is that during the winter season not enough water is taken for proper development. Another reason, perhaps, may be that a great many times not enough protein is supplied. A third important factor is the oxygen factor which is determined by means of exercise. Aside from these three principal considerations there are other minor considerations, such as protection from cold, furnishing a dry place to sleep, freedom from cold-draughts, plenty of sunlight, etc.

One of the main reasons for the continual change of breeds is the fact that feeding is improperly done so that herds run down, where if they were properly fed, they might gradually be built up and improved.

Thus it can be seen that success in swine breeding, as well as in swine feeding depends primarily upon supplying the pigs with a proper quantity of the various digestible nutrients, such as protein, carbohydrate, ether extracts, mineral matter, water and oxygen, and, furthermore, that pigs are fed right during a long series of generations. —Wm. Dietrich.

Bran, milk and pasturage are some of the bulky feeds well adapted to the young pig. They help to distend the digestive organs, which enables the pig to use cheaper and coarser feeds to better advantage than the pig raised on concentrates.

See What Is Under The Paint When you Buy A Manure Spreader

CHOOSING a spreader that will prove a big paying investment for years to come is a serious problem. You can't judge by appearance, for all spreaders look very much alike.

The way to be sure is to get right into the details of construction. See how and of what they are made. The handsome finish of—

I H C Spreaders

Corn King **Cloverleaf**

is a true index to the quality in every part—not a cloak to cover up defects in workmanship and material. See them and judge for yourself if there are any others which have—

—such a noticeable absence of troublesome, unimportant gear wheels
—so few levers
—such a perfect apron
—such wonderful range of feed under absolute and instantaneous control of the driver
—such remarkably light draft, due to roller-bearings
—such perfect distribution
—such strength in every part.

I H C spreader frames are made of hard, heavy, non-porous, resinous wood—air dried, so that the sap is retained and the wood fiber cemented together. This prevents the manure liquids from penetrating the wood—makes it impervious to manure acids.

The Cloverleaf spreader has an endless apron. The Corn King spreader is of the return apron type. All are made in several sizes ranging in capacity from 30 to 70 bushels. All can be furnished with lime hoods to spread commercial fertilizer and drilling attachments to distribute manure in rows.

Ask the I H C local dealer to show you the style and size that will just meet your needs. Investigate its construction carefully. Compare it with any other make if you wish—then decide. If you prefer write to nearest branch house for catalogue and full information—mail a postal today.

The Empire Cream Separator Company of Canada,

Sussex, - - N. B.

DAIRYING.

C. W. McDougall, Dairy Inspector, staff Contributor.

How to Operate a Cream Separator

The cream from the centrifugal machine is of finer quality and a much better product can be made from it. The skimmed milk is sweet and fresh for feeding, and is far superior to that from the gravity system.

There are numerous kinds of mechanical separators on the market, but they differ in detail of construction rather than in the principles on which they work. The dairyman or farmer should thoroughly understand these principles.

In selecting a separator one should first determine its value for good work and then examine its mechanical construction to see it it will stand long usage.

SIZE OF SEPARATOR TO BUY.

The most common size needed depends upon how many cows the dairyman is milking. A 500-pound capacity to the hour is large enough for one having from eight to fifteen cows. It pays to buy a high capacity machine for three reasons.

1. Because every day's run will be shorter and the machine will last longer. For instance, a 300-pound capacity separator will require one and one-half hours to run 450 lbs. of milk through it. A 600-pound capacity machine will do it in just half the time, or three quarters of an hour. The wear and tear on the larger machine being only half as much as the smaller one, it will last twice as long.

BUY LARGE SIZE MACHINERY.

2. You save time and hard labor by getting the larger size. There is very little difference in care in running the two sizes. It is mostly a question of the length of time to run it, whether you turn the crank for three quarters of an hour twice a day or cut the time down to twenty minutes, for this is about the time required in the ordinary farm dairy.

3. You may some day decide to increase the size of your herd, necessitating the trade of your small machine for a large one. This would be expensive.

When I bought my separator, I bought one 450 to 500-pound capacity machine and had only two milch cows and before I got the separator I had hardly enough butter for the house. After I got my separator I sold $2.10 worth of butter at 21 cents a pound so you see the profit right away.

COMMON ERRORS WITH SEPARATORS.

Two errors are made in operating separators. The first is in allowing too much milk to pass through the machine. As there is a limit to the practical speed at which the machine can be safely run, it is not a good practice to try to overcome the error referred to by increasing the speed beyond the safe point.

The feed outlet is usually fixed so that too much milk will not run through, but cases have been known where operators anxious to shorten the time of separating, have enlarged the opening, allowing too much milk to pass. This error is not so common as the second is to allow the speed of the machine to become too slow.

The slow speed does not generate enough force to skim properly and the result is a loss of butter fat in the skim milk. The number of revolutions per minute required by a machine is usually indicated on the machine or in the instruction book belonging to it, and this should be strictly followed.

TEMPERATURE FOR SEPARATING.

All liquids flow more readily when warm than cold. This is not as noticeable with milk as it may be with molasses, but the principle holds just as true and is readily shown in the separation of milk. Everyone has observed that cold cream does not flow as readily as warm cream.

As cream is one of the products of separation and has to flow from the machine through a small opening or outlet, it is seen that the warmer it is the more readily it will flow. For this reason the nearer the temperature of the milk approaches the animal heat the better will be the separation.

While some machines are supposed to skim milk as cold as 65 degrees Fahr., it is not a good practice because the skimming will not be so close. The milk should be at a temperature of 80 degrees or higher.

SUMMARY OF POINTS TO BE OBSERVED.

To summarize the points in the operation of a separator given in their order of importance as bearing on the quality or work, are as follows:

1. The speed of the separator must be uniform and up to the standard required by the makers of that particular machine.

2. The temperature of the milk should be such as will make it flow readily; the warmer it is the more perfect will be the separation.

3. The amount of milk that is run through the machine should remain constant and should not be increased over that which is intended for the machine.

4. The machine should be set on a solid base or foundation so that there will be no jar or shaking about as it is turned, such as would tend to interfere with the even flow of the milk through the bowl and thus destroy its efficiency in skimming.

SEPARATOR MUST BE KEPT CLEAN.

5. The separator must be kept thoroughly and scrupulously clean, particular care being taken that none of the tubes through which the milk flows become obstructed in any way.

6. The test of the cream can be readily changed by changing either the cream outlet or the skim-milk outlet.

In the mechanical operation of a machine none but the best oil should be used, and this should not be allowed to gum or become filled with dirt on the bearings. A good practice is to flush the bearings with kerosene occasionally by making a run with kerosene in the oil cups. This will serve to cut out any gum or dust that has accumulated in the bearings and will make the machine run much more freely and easier, thus greatly increasing the length of

Magnet Cream Separator "Sanitary Strainer"

For STRAINING MILK. Patent No. 123484.

PRICE $1.00 COMPLETE.

Fits the MAGNET Tank or any pail of same size.

All milk strainers have failed to meet the requirements of Dairy Authorities except the cloth strainer, which can be washed clean.

The difficulty of holding the cloth on the top of the pail or tank has prevented the general adoption of the cloth strainer for the cream separator.

The MAGNET Skimming Perfectly sitting on the rough PRAIRIE
THE SQUARE GEAR AND DOUBLE SUPPORTED BOWL DOES IT
STEADY AS A ROCK

By a simple spring device (MAGNET PATENT), which circles the top of the tank and holds the cloth in position, this difficulty is overcome and the milk strained directly into the tank.

The advantages are :—

1st. Great convenience in straining the milk.

2nd It retains the animal heat thus enabling more complete separation of butter fat from the milk.

3rd. Prevents dust or foreign matter from falling into the tank.

4th. Nothing to wash except the cloth.

5th. Time and labor saved. Adjust the spring over the cloth, holding it tight around the top of the tank, that is all.

6th. The only "Sanitary" Strainer known.

7th. It is simple, clean and will not wear out.

8th. The same MAGNET quality to the strainer as in the Cream Separator.

9th. Every MAGNET Tank should have one fitted on.

Fill in the coupon with name and address, enclose **one dollar** and strainer will be sent you prepaid Money refunded if you do not find it the handiest article in your dairy.

Please send a MAGNET "SANITARY STRAINER," charges paid,

Enclosed please find $1.00 stamps of postal order. To .....P. O .....Province

The Petrie Manufacturing Co., Limited

Electric elevator—lady attendant—Telephone Main 2367.

Our wonderful machines (which sell for $25 and $35) cure all curable diseases. They last for life. May be used by men, women and children. They are not an experiment. Have had 14 years of successful record. Our 72 page book, "Oxypathy," for the asking. No drugs, massage or electricity used. Just Oxygen and nothing but Oxygen. Scores of reputable citizens throughout the Maritime Provinces attest the splendid curative power of these marvelous machines.

Address all communications to

C. Fraser McTavish, General Manager

P. S.—Machines rented by the month if desired.

P. S.—A No. 1 position open (to represent us) in unoccupied territory to high-grade men and women.

Could They Be More Foolish?

The best proof that common cream separators are out-of-date is the fact that they contain 40 to 60 disks or other contraptions. They need such contraptions simply because they lack skimming force. Since they lack skimming force, they are neither modern nor properly built. In view of these facts, could any maker or agent of common cream separators be more foolish or incorrect than to claim that disks or other contraptions make, or are needed in, a modern machine?

Sharples Dairy Tubular Cream Separators

Dairy Tubular Bowl. Made right. No disks needed.

are entirely different from all others. They produce twice the skimming force of common separators. Dairy Tubulars neither use nor need disks or other contraptions. They skim faster, skim twice as clean, wash many times easier, and wear several times longer than common separators.

The World's Best. The manufacture of Tubulars is one of Canada's leading industries. Sales easily exceed most, if not all, others combined. Probably replace more common separators than any one maker of such machines sells.

time that it will last and do perfect work.

Men Who Know.

Editor Maritime Farmer:—

"I find the keeping of individual cow records very useful indeed, and would not go back again to the guessing method," writes a farmer who has tried both ways.

The men who just guess and who who do not know what each cow in the herd gives during the year, often guess too much on the weight of milk and fat, and too little on the cost of feed. They guess that "Polly" is the best cow in the herd, but they do not know, because they have not weighed or testeh the milk on any system. Probably "Buttercup" is far ahead of "Polly" as a producer.

The men who know the best cows in the herd, those who know which cows produce a large quantity at a low cost are the men who not only get good satisfaction out of keeping good cows, but they are the men who get good money when they sell, because they have records to augment the value. The men who know the poor cows by their records sell them off for beef and save time and labor and feed and stable room and bad language. The men who know enough to select good cows on their records of production are the successful dairymen to-day. The Dairy Division, Ottawa, supplies record forms for milk and feed so that men can soon know what profit each cow pays. The question is not "what does the herd average this month or next, but what does each cow give during the year?" Each cow should be a "long distance" milker.—C.F.W.

Getting Cows in Shape.

Every cow ought to be given a vacation of six to eight weeks before freshening. After she is thoroughly dry her feed should be of the best in quality and sufficient in quantity to enable her to lay on flesh. Here is where most dairymen make their greatest mistakes. They do not consider that a dry cow needs much feed since she has only herself to keep. At no time during the lactation period will it pay better to feed a cow well than while she is dry. The flesh she gains while dry will cost for feed from six to ten cents per pound, depending on the season. After freshening she will milk off this extra flesh in butter fat at from 25 to 30 cents per pound, giving you a profit of from 300 to 500 per cent on the cost of the extra feed it took to put this flesh on her. A mighty good investment, yet how few dairymen feed the dry cow much above a maintenance ration unless she herself gets it from good pasture. In view of this I say feed her very liberally after she is dry. Corn, oats, and bran, equal parts, make a good feed and all these grains are available to nearly every dairyman. During the winter months a few pounds of such a mixture in addition to silage and clover hay, if you have both will put a cow in fine condition. If she is on good grass a little of the above grain mixture will likewise help to put her in most excellent condition.

Two weeks before freshening it might be wise to reduce the amount of corn meal and increase the bran. Say what you will about the cost of bran, it is the safest feed to give a cow about to freshen. At this period attention is necessary every day. Watch the udder develop; see that the cow lacks nothing to make her comfortable and gain in strength so that she can make up a fine udder. In winter the feeding of a little oil meal is almost necessary a few days before freshening. Begin with one-fourth pound per day and increase by one-fourth pound per day up to one or one and a half pounds per day. Things will move along better by so doing, the after-birth will be expelled quickly, and the cow will regain her strength in a short time.

After calving milk little and often one quart from each teat every two hours will keep the cow in better shape than milking her out completely in one operation. I consider milking a cow clean immediately after calving a dangerous practice. It induces milk fever and other udder complications. Give her warm water for a day or so after calving, and a good bran mash as soon as she will take it. Continue this for a few days after. Take the calf away within two days anyway. Watch the udder and begin increasing the feed very gradually if no bad symptoms appear. Don't be in a hurry to get her on full feed; take three weeks in which to do that. Feed a balanced ration. If you are in the race simply for production, make one-half her feed of grain; if for the most profit, give her all the ensilage and clover or alfalfa hay she will eat and enough grain to bring you the greatest percentage of profit.—Experienced Dairyman.

Mrs. Edward H. Marshall, a noted dairy woman of New York, says this:

Here are a few simple rules which extended our market to twice what we can produce, at three cents above the regular market.

Clean up your barn and keep it clean.

Listen to the big dairy teacher.

Keep your score high. It is a letter of credit.

Take the dairy papers and read them. I don't care if your "think machine" is a Solomon, you need the dairy editor to crank it up.

Put your reputation behind your product and let the consumer know it.

Simple rules, but follow them; they pay for farms.

WINDSOR TABLE SALT

Growing Apple Trees From Seed.

(Continued from page 671.)

seeds are saved during the winter, they may be stratified, that is, mixed with moist sand in a box with holes in the box for drainage and then placed outside to freeze. The box should be placed on the north side of a building. If the seeds are dry keep them in the moist sand for 24 hours in the house. Before placing outside be sure there is a close cover on the box, otherwise the mice will clean out your seeds even if frozen among the damp sand.

We sow seeds in rows three feet apart and one and a half inches deep and rather thinly, say eight seeds to the foot. On our land we find it necessary to mulch the fall sown seeds in order to guard against heaving out in spring. Where the quantity of seed sown is small, the seeds may be sown in beds four feet wide and as long as required, the beds should be bounded by boards eight to ten inches wide, set on edge. The seeds are then sown in drills ten inches apart. As soon as the plants appear above the ground they will be benefited by being slightly shaded from the sun. This is best done by lath screens; the spaces between the lath may be two inches wide. As soon as the second pair of leaves form, the screen may be removed altogether. If the season is dry it may be necessary to water occasionally. When this is done a thorough soaking should be given. A light sprinkling every day is worse than useless. In the fall the young seedlings are dug up and heeled in outside. In the spring they are planted out in nursery rows, eight inches apart in the row, the rows four feet apart. It is important that some protection be given the young seedlings the first winter, otherwise the rabbits will have them cut down to the ground. Injury by girdling from field mice will also have to be guarded against This is usually done by throwing up a light plow furrow against the trees on both sides of the row, the tops of the tallest ones being bent over and covered with earth. The seedlings are left in the nursery row for two years, then each year they are closely examined when in full leaf, the thorny small leaved ones are cut out and only those with large thick leaves are left to fruit. Those having bearing trees can hasten this by taking scions off the seedliogs and grafting them into the bearing trees. In a couple of years they will usually come into bearing when a fair idea can be formed of the quality and size of the fruit your seedlings are likely to bear.

This is a line of work that needs many to take part in and without doubt the results will be of great value. Every precaution should be taken to plant seeds of the very hardiest obtainable varieties, as hardiness is the first and most important essential on the northern border of apple culture.

Pruning Apple Trees in the Nursery.

Pruning apple trees in the nursery, according to a nurseryman's point of view, requires a considerable amount of skill and study.

A MAN'S BOOK

A PRIVATE TREATISE, WITH CHARTS AND ILLUSTRATIONS, RELATING TO DEBILITY, ITS CAUSE, EFFECT AND HOME CURE.

Let Me Send It to You FREE!

Here is a little volume of cheer and helpfulness which all men, young or old, can read with great profit; it contains much valuable information of a private nature, is fully illustrated, and represents the practical knowledge I have gained from forty years of actual experience in giving help to upwards of 100,000 enfeebled, nervous discouraged men. Just a postal card with your name and address, and the book will be forwarded free, sealed, by return mail, and with it, as well, I will enclose a full description of my new 1909 model Electric

Health Belt

If you need new strength, this wonderful appliance must appeal to you. It generates a pleasant, exhilarating current instantly felt, though it can be made any degree of strength from mild to strong by simply turning the needle of the current regulator; worn nights while you are sleeping, it pours quantities of health-giving, soothing electricity into your sick, weak nerves; you get up mornings feeling bright, strong, full of courage and ambition; it takes all the weakness and pain out of your back; it is a great remedy for your kidneys, bladder, stomach, liver and other vital organs; it cures rheumatism in all parts of the body; it is a courage-giver of the highest order; it brings new strength where weakness exists; it will restore you to vim, vigor and true manhood as sure as night follows day; it makes you feel young and look young; you will live longer for its use; you can throw away all drugs and commence to live as Nature intended you should—a man among men, healthy, happy and vigorous. I can send you thousands of testimonials if you care to see them. Here is a sample Cure :

"Your Health Belt cured me of Nervous Debility, Lost Vigor, Kidney and Bladder Troubles after all else failed.
"CHARLES L. SNELL,
"Middleport, N. Y."

In all instances I concentrate the full positive current at small of back; it thus enters the system at the nerve and vital centre,

passing thence through the different weakened organs, giving them new life and force. You can get the Belt

ON TRIAL UNTIL CURED

or for cash at a discount, just whichever you wish. Send your address on postal or fill in coupon; or, call at my office, if you live in or near this city. Advice concerning your case will be cheerfully given without charge or obligation.

DR. M. F. SANDEN CO., 140 Yonge Street, TORONTO, Ont.

Dear Sir:—Please forward me your books, as advertised, free.

NAME.....

ADDRESS.....

When writing advertisers please mention this paper.

Quite a number of young apple orchards planted throughout the country are useless and unsightly through improper pruning in the nursery; each variety of apple making a different growth requires a way of pruning.

If you have had occasion to visit a nursery during pruning time you will have noticed that trees are, as a rule, pruned to one height, and then topped in order to give them a fine appearance in the nursery, regardless of their shape as an orchard tree in time to come. Later, when visiting the orchard, you will have wondered why it is that so many trees are broken down and split from the top. The orchardist will tell you that the damage was caused by wind. He has not the slightest idea that the cause of the top splitting was by improper pruning in the nursery in the first place.

In order to prune intelligently and successfully in the nursery one must make a close study of the habits of each variety of apple in the orchard. The apple requires constant watching from the time it is planted, whether it is piece root, graft or budded. Rubbing the foliage from trunk of graft or bud, as some nurserymen do, in order to make the tree reach a greater height, is a mistake. It leaves a slender, weak tree, with the bark discolored and burnt by the sun. All foliage should be left on young trees, also all limbs that are encroaching upon the leader, in order to produce a good stocky tree.

In pruning trees great care must be taken in pruning off limbs. Use a sharp pruning knife, cutting from the under side of the limb, with the knife cutting to the body of the tree, being careful not to cut in the shoulder of the limb. If you watch the lower end of the limb connecting with the body of the tree, you will find that each limb has a shoulder. Nurserymen will quite readily understand this term. If the shoulder is cut into it leaves a cavity in the tree which takes years to heal over, making a hiding-place for Aphis and other pests to breed in. If the limb is cut off at the shoulder it will callous in a short time, leaving a perfectly smooth tree. All limbs possible should be left on the young tree—if they are not directly retarding the growth of the leader—until the tree is fit for market, and then pruned as above stated. There will be fewer trees put on the bush pile and fewer unshapely trees in your orchards. The orchardist should have an opportunity of training the tree to suit himself.

Potash Uses up Lime.

When potash salts are applied to a soil the potash enters into combination with the soil-lime, and is converted into a form in which it is available for the crop, but it is also a form in which a portion of both the potash and the lime is apt to be lost in the drains. Hence it has been said that potash uses up lime, and lime uses up potash.

It is for this reason that farmers who are in the habit of applying potash salts in liberal quantities to their crops, such as regular growers of potatoes and mangolds, should be careful every few years to give a dressing of lime, otherwise the crop may suffer from a deficiency of this constituent.

In addition to being a necessary plant food, lime also exercises an important ameliorating influence on the physical condition of the soil. It warms the soil, breaks up stiff clay soil, and helps to bind light open soils. It neutralises the action of acidity of soils, and helps the disintegration of organic substances. Lime, judicially employed, is one of the most useful friends of the farmer.

We shall exhibit our Perfect Barn Equipments at the Exhibitions at St. John, N. B., Halifax, N. S., and Charlottetown, P. E. I. Call and see us.

All steel pipe and malleable castings.
No rough edges.
No threaded joints.
No place to hold germs.

THE HORSE.

Un-nerving.

Un-nerving the navicular subject does not cure the disease; on the contrary, the destructive changes, in the majority of cases at least, still goes on, but it destroys sensation in the foot, takes away all pain and consequent lameness, and renders the horse useful for a period depending on the care and skill exercised in selecting suitable cases, the attention paid to the feet, and the excellence of the shoeing, with, perhaps, something in the way of "luck" as to the escaping from stabs, pricks, and bruising of the foot that will sometimes happen despite the exercise of the greatest care.

Neurotomy on its first introduction has a great vogue, but its injudicious employment and the want of judgment in selecting cases soon brought it into disrepute, and it became neglected in those cases in which resort to it would have been a great boom to both horse and owner. Strong, well-formed, open feet that are free from corns should be the characteristic of subjects selected for unnerving those that are thin, weak in the heels, and full in the sole should be rejected.

The operation is very simple, and presents few difficulties if performed under chloroform, but it is practised mainly by experts, and some veterinary surgeons make it a specialty, and operate for the profession. It consists of removing a portion —about an inch—of the nerve supplying the foot with sensation. The horse has to be cast, the limb to be operated on removed from the hobbles, the hair closely clipped from over the part, the surface asepticised, and a transverse incision made through the skin just above the fetlock joint, the trunk of the plantar nerve searched for, picked up, freed from connective tissue, cut through, and about an inch removed from the side most remote from the nerve centre. The object of this is to avoid the infliction of further pain, which would result from making a second cut through the superior end of the nerve.

A bloodless operation is secured by putting a tourniquet around the arm before the operation is commenced, and quietness on the part of the patient by the employment of chloroform, in addition to which there is, of course, to be considered the absence of pain to the animal. These are no mean advantages when such a delicate structure as a small nerve trunk has to be found and distinguished from the artery running close alongside it. After one side is finished and the edges of the wound secured with a pin suture, the horse has to be turned and the operation repeated on the other, or when both feet are diseased it is usual to operate on the under leg, removing the inner nerve, and then on the outer side of the upper limb, the reverse sides being operated on when the animal is turned.

There are two forms of operation the high and low; but the latter is now rarely resorted to, because not neaely so successful. In the "low" operation only the posterior branch of the nerve is divided, leaving the foot with some feeling, but this often leaves some lameness as well. The "high" operation, dividing the nerve trunk above its bifurcation, is the most reliable, because all sensation is then removed from the foot, and there is no lameness, because no pain. Unnerving has some drawbacks or unfavorable results, even in well-selected cases, but when the horse is incurably lame, and, therefore, useless for work, it becomes a question of this kind: We have an animal that is only worth knacker's price, because to work it would be cruel, and apart from the cruelty there would be a risk of prosecution for working the horse in an unfit state. If we unnerve it, and it only lasts six months, its labor will pay for the cost of operation. But instead of lasting six months it may, with judicious management and a little "luck," last as many years, or until the horse meets its end from some other cause, so that instead of being sold and resold, going from bad to worse, not only as regards the disease, but with respect to ownership, the animal is usefully performing the usual work of its class.

The success of neurotomy is immediate since the horse gets up free from lameness, but about three weeks' rest is necessary for the wounds to heal properly, and during this time there is a great improvement in the action. Being no longer in pain the horse steps out and the muscles of the arm and shoulder, which in advanced cases become wasted on account of inaction, become again developed. Instead of a tottering cripple scarcely able to put one foot before the other, there is a useful working horse, and one that does not blunder or stumble, as many expect it will. The worst pace of the horse suffering from navicular disease is down hill, but the unnerved animal may be ridden or driven down hill, over hard roads or in the hunting field with perfect security. Sometimes nerve tumors form on the cut end of the trunk and cause lameness, but the removal of a neuroma is not more difficult than division and excision in the primary operation. Pricks in shoeing or other injuries that, when there was feeling in the foot would cause lameness, may pass unnoticed in the unnerved animal. There being no sensation, and, therefore, no pain, suppuration is often extensive and the hoof almost separated from the true foot structures before the mischief is detected. This is one of the drawbacks of the operation, and to minimise this risk the unnerved horse should be very carefully shod, and the feet inspected and well washed out each time the horse comes in from work. It is also an advantage to keep thick felt swabs, dipped in cold water, on the feet at night, to delay as far as possible the advance of disease changes in the structure involved. Other untoward complications are fracture of the navicular bone, disintegration and rupture of the tendon, causing the toe to cock up, and a peculiar gelatinous degeneration of the bursa, tendon, and contigous structures. These are due to disease changes which continue to go on while there is no lameness, but do not occur in every case. They are risks that have to be accepted in the choice between an incurably lame horse, and, by resorting to unnerving, a possibly useful servant.—Mark Lane. Express.

It Works While They Work
If horses go lame, you don't have to lay them off to cure them. Kendall's Spavin Cure works while they work—and cures them while they earn their keep. For Spavin, Curb, Ringbone, Splint, Sprain, Swollen Joints, Lameness
Kendall's Spavin Cure
"Completely Cured Him"
Moose Jaw, Sask., Oct. 13th
"Two years ago, I bought a colt that was badly spavined, and completely cured him with only two bottles of your Spavin Cure. Worked him steady all the time and sold him last winter for a top price."
Howard Brock.
Also famous as the standard family liniment $1. a bottle—6 for $5. Ask your dealer for free copy of our book "A Treatise On The Horse," or write us. 53

Mating Horses.

For the average breeder, the best time to get the mares to foal down is when the genial weather has come or is near at hand, and the supply of food is ample. It may suit the purpose of the breeder for show to get early foals, and there are special circumstances that may justify an individual in arranging for foals to be produced at out-of-the-way periods; but in the ordinary work of the farm, there is no better month than May for the birth of foals.

As the period of gestation in the mare is about eleven months, it behoves those who wish their foals to come in May next year to lose no time in sending mares for service. Let us repeat with emphasis the advice so often given; that the owner of the mare should bear in mind that a little extra money given for the use of a good stallion is fully repaid by the superiority of the foal. More particularly is this the case when the choice is between a sound sire and one that is troubled by any of the diseases classed as hereditary. Foals from unsound animals will, in the majority of cases, sooner or later develop the same diseases.

This "sooner or later" makes a lot of difference in the way in which this question is regarded. It is, in one sense, a misfortune that the offspring of unsound horses are not born unsound; if they were, the uneconomical results of such mating would be evident and would appeal very forcibly to the pocket of the breeder. But, in effect, what the foal inherits is a tendency to disease, and before it is developed the breeder has sold him. Thus the evil is unnoticed by the man mainly responsible for causing it.

Severe Pains In The Liver.

Had Several Doctors.

A COMPLETE CURE EFFECTED BY A FEW VIALS OF

MILBURN'S LAXA-LIVER PILLS

Mr. F. H. Wood, Crystal, Ont., writes: "For several years I was greatly troubled with severe pains in the Liver. I had several doctors attend me but without any success. At last I was advised to try Milburn's Laxa-Liver Pills. and after taking a few vials I was completely cured. It is, now, about six months since I took them, and I have had no return of my trouble since. I can honestly recommend them to every person who is troubled the same as I was."

Milburn's Laxa-Liver Pills are 25c per vial or 5 vials for $1.00, at all dealers or will be mailed direct, on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

Geese on the Farm.

There is no doubt that by good and careful management geese can be made to pay well and bring the farmer a good profit. There is plenty of room for improvement with geese. The specimens for sale in any large market are so varied, both as to size and quality, that there is no doubt with careful breeding (the selection of sound stock birds), and the subsequent fattening of the best methods, a very great improvement could easily be made at very little extra cost, and with much better results.

There are two well known varieties of birds, the Toulouse, grey in color, and the Embden white. Of course, they have been very often crossed, as the numbers of grey and white geese about the country can testify.

Now as to the respective merits of the two breeds. The Toulouse attains a larger size, but the Embden matures more rapidly, and so is ready for the autumn or Michaelmas trade when the Toulouse is not. The Embden lays fewer eggs, but wants to set early; the Toulouse is not a good sitter.

From experience we think a cross of the two breeds is to be recommended—a pure-bred Tolouse gander with pure-bred Embden geese. It is best to have one gander and only two or three geese as stock birds; but they must be mature birds, preferably of the third year, as they produce the strongest goslings.

The geese will begin to lay early in March; their eggs should be removed and placed under good large hens—an Orpington can manage four well.

They need a month to hatch out in, and need little looking after, except that towards hatching time they should be daily sprinkled with a little water, which will help the young birds to get out. For it must be remembered that in a natural state the eggs are very often in damp places, and if under a goose they will daily be wetted by her when she returns from the water and resumes her sitting on them.

If the daily wetting is not carried out, the eggs hatched under a hen will most probably hatch out badly. Goslings are very strong and easy to bring up. They need neither a hen to brood them nor a foster-mother. They can be hatched under a goose; she makes a very good mother. But this fact must be borne in mind; if left to herself she will probably lay from twelve to eighteen eggs only, whereas if they are taken away and put under a hen, she will probably go on laying more than that number.

Perhaps the best plan is to let the first of the eggs be incubated by hens, and the goose have the others. If once she becomes broody she will sit; nothing can move her.

Now as to general management and feeding. The older birds require very little. One essential is a pond or stream. They eat large quantities of grass, and on that account are regarded as nuisances by some farmers. Three or four stock birds at liberty on a farm will only need a feed of oats at night. Young geese will do well on plenty of coarsely ground oats, varied as they get older with some whole oats.

Geese cannot be fattened shut up like poultry. The only way is to give them plenty of good food, leave them at liberty, and let them be kept quiet. Shut up, they would fret, and, of course, never fatten.

Plenty of grit must be provided; they need it for their digestion, and nothing will be lost by keeping it about for them; for even on a good-sized farm they will not always be able to find enough.

For the first fortnight or three weeks of their lives goslings must be kept under restraint and well in the shade, as they are very apt to get sunstroke.

Geese are best killed by a good blow on the back of the head, and this should be followed up at once by bleeding. The bird dead, the feathers should at once be plucked, as they come out then so much more easily.

ECONOMICAL FEEDING.

The subject of economical feeding is one which interests all poultry keepers, but when the question of the cost of food comes in it will be found that the best is always the cheapest when fed to birds which are bred for laying.

When giving grain for the last feed in all cases let it be good and of nutritious quality. When it is wheat it does not matter if it is small so long as it is sound, because the kernel of wheat is nutritious. We mention this fact more particularly for the sake of farmers or those who can get good small wheat cheap.

Wheat and oats are the grains used principally with maize on cold days, and particularly when the birds have a free range over grass. We do not advocate the use of maize indiscriminately.

Where fowls have a good range and get hold of plenty of worms, etc., besides scraps from the house, etc., and commence laying, they can have a supply of maize, and it will not hurt them, but if they are fed on maize liberally during the winter before they begin to lay, they get fat internally.

We do not object to maize being used twice or even three times a week in cold weather, as there is a great deal of heat in it, and that is what poultry keepers should study.

Many poultry-keepers give their fowls food because it is food, not thinking whether it is suitable for the time of year or not. When the weather is frosty or very cold, always try to get some rough fat from the butcher, and mix it in the hot food in the morning.

It is well to boil the grain for a change. This should be placed in a saucepan, or some vessel in cold water, with a little salt in, first covering the grain with water, then place it over the fire, and let it come to the boil; then stand it on one side—that will draw all the water up—and give it hot before they go to roost at night. This should be done twice or three times a week, when it is cold or frosty weather.

On very cold mornings the birds should have warm water given them to drink. After they have had as much as they want to drink, the vessel should be tipped over; it freezes in the trough. Then warm water should be given again in the afternoon.

Broody Hens.

When the hatching is over, the care of the broody hens becomes a vexing question for the balance of the season, especially where the American or Asiastic breeds, that are prone to broodiness are kept.

It is not difficult to arrange things so one's temper may not "fly" too often.

The handiest way to care for them that I have found is a cage built of poultry netting. It is perhaps five feet long, three and a half feet wide and two feet high, with a cover hinged on top which can be lifted when you drop the broodies in, and lifted up and tipped back when you want to let them out. They soon learn to fly out themselves.

The floor where this sets should be swept clean so they can get no nesting material. A dish of water can be set just outside the netting and they will put their heads through to drink, but cannot upset the dish. The wire netting offers a chance to throw grain through when you are feeding the main flock, without trouble or loss of time.

The way to break up" hens quickly is never allow them to stay on the nest over night. I go each night and put all that are on the nests into the wire cage. The next night I let them all out and any that go back are again put in, as well as any new ones. This makes a continuous performance, but requires little time.

If you want them to get back to laying quickly you cannot adopt the old method of letting them set a week, then tying a tin can or something else to them, or standing them in a tub of water to scare their wits out of them.

Give them a good coop, food and water, and they will reward you by getting back to laying in a few days. This treatment is better and better for the man for it saves his temper and increases the egg yield.

If we keep hens that are prone to sit, we might as well accept the "broody part" and treat them well, for the trait is sure to "crop out" sooner or later.

The warmest friends of Red Rose Tea are those who have tried some other brand said to be "as good as Red Rose" and for which they paid the same price. Very easy to say a thing is "as good" but not so easy to "make good." 66

Prices: 30c., 35c., 40c., 50c. and 60c.

HAD LAME BACK

Was Almost Unable To Move.

Two Boxes of Doan's Kidney Pills Cured Her.

Mrs. M. B. Cairns, Upham, N.B., writes: "I feel it my duty to drop you a few lines to let you know what Doan's Kidney Pills did for me. I had such a Lame Back that I was almost unable to move, and my kidneys were in an awful condition.

"After taking two boxes of Doan's Pills I was completely cured and feel as well as I ever did."

Doan's Kidney Pills are a specific for all Kidney Troubles. They begin by expelling all the poisonous matter from the kidneys, and then heal the delicate membranes and make their action regular and natural.

Doan's Kidney Pills are entirely vegetable, and may be safely taken by young and old.

Price 50c per box, or 3 boxes for $1.25, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

When ordering direct, specify "Doan's."

Telegraphy

with a thorough knowledge of Station Agent's work, as taught in the Central Telegraph School, Toronto, and with the influence of a well established reputation, like ours, is the surest passport into a good salaried situation, leading to a successful future. When the digestion is all right, the action of the bowels regular, there is a natural craving and relish for food. When this is lacking you may know that you need a dose of Chamberlain's Stomach and Liver Tablets. They strengthen the digestive organs, improve the appetite and regulate the bowls. Sold by all dealers.

Evaporated Apples.

The Canadian Trade Commissioner at London, Eng., reports to the Department of Trade and Commerce, Ottawa, that although the United States remains principal source of supply for evaporated apples imported into the United Kingdom, Canada is obtaining a larger share of the trade than in the past, and with a little more enterprise should be able to develop the business considerably. A London firm which have been handling Canadian evaporated apples for the last few years, stated recently that they could dispose of much larger quantities if they could arrange for additional sources of supply. As their views should be of interest to Canadian producers and shippers, their ideas have been embodied in a letter, which is herewith reproduced:—

"We last season imported 3,220 boxes, and while the quality was on the whole fair, there were some exceptions which did not come up to the average, and of which we had to make claims on the shippers. Even the best of the shipments we received did not come up to the quality of the previous season, but we understand this is not due to any fault of the packers, but to the inferiority in quality of the fresh apples. With regard to prices, these opened high and held until shortly after Christmas, when the market began to fall away and it has continued on the down grade ever since. Late advices from Canada are to the effect that the market there has taken a turn, and that prices are much firmer, but this change has not been reflected on this side, and what apples are on the spot are being pressed for sale at low figures. With regard to the coming season, business has already been done, several transactions having taken place in prime quality rings on offers received from United States packers. The business opened at 33s. per cwt., then gradually dropped to 31s.

"If prices touch somewhere about 285 per cent. a large trade ought to be done in the coming season, as when the prices are low the consumption of evaporated apples is much heavier than when the cost is high. 'We understand from New York advices that certain portions of the United States apple crop are in splendid condition, whereas other districts are reported to have been adversely affected by the severe weather they had some time back. Judging from the prices the United States are quoting, the indications are that their crop is expected to be a fairly good one. So far we have no prices for new season's Canadian rings, but they would be readily saleable to-day at the same price and terms as United States packs if we were able to offer them. It is a disadvantage not to have prices for the new season's Canadian rings, as early as the United States, because a considerable amount of the business is transacted on a forward basis, and when prices for Canadian rings are only available when the pack is actually dealt with, a very considerable portion of the season's business has already been affected.'

"Although the consumption of dried and evaporated apples and other fruits is proportionately much larger in some of the continental countries—more notably Holland and Germany—than in the United fflingdom, there is a considerable consumption in this market. Apparently there are plenty of importing firms who are ready to negotiate with Canadian producers who can offer high class goods and can be relied upon to make regular shipments."

Banding Apple Trees.

In apple sections infested with the codling moth, the time has come to supplement spraying. No matter how thoroughly the spraying may be done there are always some moths left.

In addition to spraying, we have used bands for many years with excellent results. Our experience indicates that burlap sacking, of which bran sacks are made, is the only material fit to use, because the worms will not enter bands made of dyed cloths. We aim to make the bands long enough to go around the trunk of the tree. They are placed anywhere from three to four feet above the ground, so that any hogs running in the orchard are unable to reach and destroy them. The bands should be made from eight to ten inches in width, and folded once so as to have a double thickness. When placed on the tree they should be stretched reasonably tight so that they will not sag with rain. One nail is sufficient for each band.

The larvae go into and under the bands and sometimes transform into the adult moth in less than a week, according to the weather conditions. Thus, the bands should be examined at least once a week. To do this we find that the handiest tools to use are a light house hammer or a pair of pinchers.

When removing the band, take one end in the left hand and strip it

FARMERS OF THE EAST

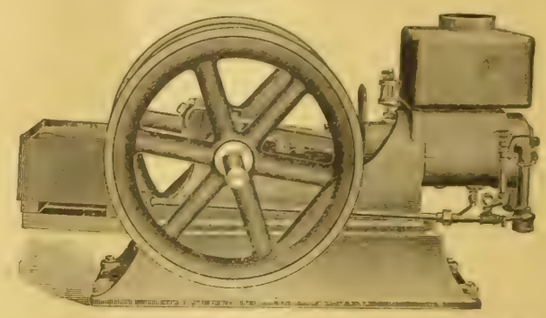
should take out an agency for the easiest selling Gasoline Engine on the market to-day. We refer to the

"WATERLOO BOY"

FROST PROOF STATIONARY ENGINE

The most complete and up-to-date Gasoline Engine on the market to-day.

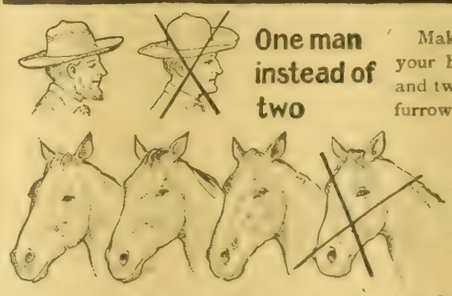
Write at once for full particulars. We will give you every assistance in making a sale. Don't delay, the territory you want might be taken if you wait until to-morrow.



I am a "Waterloo Boy" but can do the work of several horses.

J. D. FRIER, - Sussex, N. B.

What the "Crown" Gang Plow does



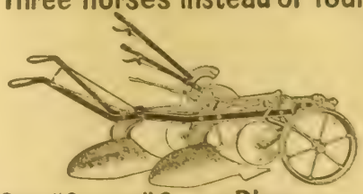
One man instead of two

Make this test: The first day give your hired man a single-furrow plow and two horses. Take another single-furrow plow and two horses yourself. Then, do one day's plowing. Together, you will plow three acres, under favorable conditions.

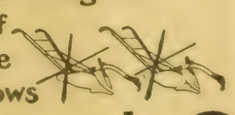
Next day, use the "Crown" Gang plow and three horses. You'll find that you can still plow three acres.

Three horses instead of four

The second day the same work has been done with one man instead of two, three horses instead of four, one "Crown" Gang instead of two single-furrow plows. What this saving means to you in dollars and cents you can figure out for yourself. But it is enough to pay for the "Crown" Gang in a few weeks.



One "Crown" Gang Plow instead of two single furrow Plows



The "Crown" Gang stays right down to its work. It turns the furrows more evenly than a single-furrow plow. The easy-working levers are conveniently located. The wheels have dust-proof boxes with roller-bearings. You should learn more about the "Crown" Gang right away, and about our special orchard gang plows, too. So write for CATALOGUE

If you have Live Stock for sale advertise in the Maritime Farmer.

from the tree carefully, otherwise some of the worms will drop to the ground and escape. Before replacing it, the band should be thoroughly examined, inside and out, so that every worm is detected and crushed.

By working systematically, a man can do about 200 trees a day quite easily.

The bands placed on the trees during late spring and early summer, should be examined for the first time not later than the middle of July, and not taken off the trees for the winter before the apple crop is harvested.

Banding apple trees is a profitable work. With spraying combined, we have frequently reduced the wormy apples to ten per cent. Another advantage to be derived, and one which is very liable to be overlooked by the grower, is the encouragement into his orchard of beneficial insects. Very often we have found while examining the bands, numbers of larvae of the ladybug beetles, ichneumon and brachonid flies, feeding on the codling worms.— G. S. Pert, Burlington, Ont., in Canadian Horticulturist.

The Strawberry Bed.

Some growers prefer to fruit strawberries only one year, but where the beds are reasonably free from weeds and the plants are in good condition it is customary and quite satisfactory to fruit the plants two or even three years in succession. Where this is to be done the foliage should be mowed as soon as the fruit is picked, usually early in July. A scythe, or if the beds are quite large an ordinary grass mower, will do the work if run quite close over the beds. This material should be either raked or burned off the plants. In a small bed it is safer to rake and burn at the side of the bed than to attempt burning it on the patch. If the field is to be burned, the grass must be thoroughly dry, so that a fire will pass over it very quietly. If it is wet and the fire does not burn rapidly, the plants are often seriously injured. This method helps to keep in check insects and some of the diseases attacking strawberries.

A soon as the beds are cleaned, the old plants should be thinned out to about six inches apart, leaving the rows not over a foot wide. Thorough cultivation should be given them the rest of the season. If the land is not very rich, it is a good plan to open a trench along the rows several inches deep, and fill with thoroughly rotted manure, covering this with soil again. One of the easiest ways to remove he old plants is to plow a furrow on either side of the row, leaving a row about 12 inches wide. Then pick all old or diseased plants from this row, leaving young, vigorous plants about six inches apart.

The soil may be cultivated back into the row, and any weed or plants between the rows should be thoroughly worked out. Thorough cultivation and care should be given the plants from now on, the same as should be given new plants set in the spring. If this is done very often, the second crop will be as good as the first.

When a diseased tree is found and the disease cannot easily be arrested, it should be removed from the orchard and destroyed. It is better to reset one tree than the entire orchard.

Do not leave lettuce, mustard and turnips in the garden after they are too old to use. They attract insects and furnish a breeding place. You will greatly reduce the number of insects next year if you destroy these old plants.

SAVES —MONEY— —TIME— —WORK—

AND REALLY COSTS NOTHING

You can easily afford this handsome, practical kitchen necessity. For our special offer (please send for details of it) lets you pay for it out of what it actually saves in lessened grocery bills. You should ask us about it at once.

Whole Table-Top one heavy sheet of

BRIGHT ALUMINUM

You cannot begin to know the CHATHAM by this picture, for the picture cannot show even one of its most pleasing and valuable features—the SOLID SHEET OF BRIGHTLY-POLISHED HEAVY ALUMINUM that forms the covering of the table-top and extension leaves. This ALUMINUM is extra-heavy weight, pure metal—LOOKS LIKE SILVER—LASTS LIKE STEEL—cannot rust—won't gather dust or dirt—easily cleaned—simply perfection ! And this is the ONLY kitchen cabinet you can buy with an aluminum top--which ADDS FULLY FIVE DOLLARS TO ITS VALUE. Yet you pay NOTHING EXTRA for it !

YOU MUST SEE IT TO KNOW IT

You must see the Chatham Kitchen Cabinet to appreciate how handy, compact, sensible it is. Exterior of specially-selected black ash, hard as rock and beautifully polished. Panels of golden chestnut. Bakeboard, drawers and flour-bin of snow-white basswood.

With the CHATHAM everything you use in cooking is at your fingertips. You can get meals ready sitting down. Your flour-bin (metal lined—holds 75 pounds !) is right under your hand in easy reach. Sugar bin (opened or closed by a touch) is just in front of you. Six air-tight canisters (free with every Chatham Cabinet) stand in the shelf-rack. Big, dust-tight drawers hold spoons, egg-beater, funnels, strainers, etc. ample closets for kettles, pans and the like.

Everything in its place And you can tidy up as you go along when you have a CHATHAM. There is a place provided for all the things you now walk back and forth for, between pantry and table. The CHATHAM spares you all those countless steps. Cupboards for jams and tinned foods; three roomy drawers (besides the two large ones) for small packages. High top makes a fine shelf for dishes—enclosed on three sides, and a rod at the back as a plate rack. Fine French plate mirror in center door—fix your hair in a second if any one comes. The CHATHAM is mounted on ball bearing castors. You can readily move it when you are sweeping up. Yet it is most solidly built—nothing shaky or wobbly about it. Whole thing is dust-tight, mouse proof—a permanent, durable, satisfying kitchen help. **Easily moved to sweep under**

YOU SHOULD NOW INVESTIGATE

Yet, with all these conveniences —features found in nothing else —the cost of a CHATHAM is probably less than you imagine. You should write us for the address of our agent nearest you. He can name you a price that will surprise—and he will gladly show you the Cabinet and point out its merits. Allow us to send you illustrated, explanatory

FREE BOOK

JUST ADDRESS

We use one of my Cabinets in my own home; and the women-folk say frankly that they simply could not get on without it. It certainly does cut kitchen-work square in half. And I know we build it so well it can safely be GUARANTEED to you.

THE FARM HOME

This Department is now being edited by a very competent lady, who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

The Old Brook Farm.

(By Virginia F. Townsend.)

She sat in the south room before her small spinning-wheel, for the time of which I write was in the opening of the nineteenth century, and the aesthetic element occupied a comparatively inconspicuous position in the education of the daughters of Puritan men and women. Pianos had not supplanted the accomplishment of pudding-making, and crinoline did not stand in the way of cheese-pressing or churning. It was a large cool room, and its two side windows looked out on a pleasant reach of pasture land, and beyond this a grove of pines, rocking to and fro to the slow soft music of the winds; and still beyond these to the sea, stretching away and joining the horizon, blue and bright and tranquil as though no tempest had ever walked over its face in darkness, and anguish, and wrath. You would hear from those south windows the soft playful plash of the waves on the sands, which mingled pleasantly with the sluggish wind in the pines, and the robin's song in the great, rambling old apple-tree, whose every bough was fluted and spangled with blossoms; for it was in the last days of May—the earth had put on her garments of praise.

So Charity Ames sat there with the sweet spring winds and the pleasant sunshine slipping through the south windows, with snatches of low psalm tunes fluttering out of her lips, and faltering back and forth in the air, a picture to gladden the eyes of any man, in her dress of homespun plaid with the small white ruffle running about her neck; and her sleeves tucked up a little above the wrists, with just the daintiest intimation of her round plump arms.

She was not beautiful, Charity Ames, but she was a little, dainty, girl-woman, with soft full outlines, and cheeks where roses forever were going in and out, and blue eyes with a dimple of sunshine in them.

She was the daughter of a New England farmer; a man whose sole earthly possession was his little yellow-brown cottage, and the few acres of land around it. His health had been broken many years before in the wars, for he had served in almost every important engagement. He was a staunch patriot; a deacon in the "stone meeting-house;" an honest, conscientious, God-serving man. Of his family only three remained—Charity and her young brothers; for his wife and his four children, he humbly trusted, were in heaven.

Charity was the light of her father's eyes; she was like a spring bird in that little brown home nest; always full of smiles and snatches of song, and pretty, graceful household ways; for the whole domestic charge had fallen on her since her mother's death, six years before. Charity was twenty-two. Of course she had not blossomed into all these years without having her share of admirers; and at singing-schools, and quiltings, and apple bees that bright, sweet, vivid face flashed in and out among the rustic beaux and maidens; but the fragrance and beauty of its life were still kept to gladden the old yellow-brown house on the Woodford turnpike.

But that afternoon, while the snatches of old church airs and the drone of the spinning-wheel were woven into each other like a bright woof and a gray warp, there went on in the breast of Charity Ames a good deal of serious dubitation, somewhat after this fashion:—

"It isn't an offer to be snuffed at, now. And to think I might really be Squire Hemingway's lady, and live in the great white house on the hill, with all those elegant carpets and mahogany furniture! Then I'd have a carriage to ride in and be so grand. And, what is more than all the rest, father is growing old, and giving out all the time, and I could be such a comfort and help to him. And send Joseph to school, for that boy was cut out for a parson or a lawyer, or somethin' more'n common folks; and I'd contrive some way to pay up the mortgage on the land without hurtin' father's feelin's, and set his mind at ease, now he's fallin' into his seventies. The Squire's almost fifty, it's true, but he's a handsome man, though his hair's got a good deal gray; and he has a little pompous way, but I s'pose it's natural. Mrs. Squire Hemingway! That sounds well. And how everybody would open their eyes; but dear me!"

Something strong, and stout, and deep lay beyond that "dear me!" for it crept out of the girl's lips with a deep sigh, and the roses hurried into her cheeks, and a sudden impetus seized the wheel, and the small feet did double duty on the treadle.

Just at that moment the small brown wicket opened, and a pair of feet came softly through the thick grass, and round by the side of the house; so softly that Charity Ames did not hear them, until she looked up suddenly and saw a somewhat slender figure, and a fine, honest, sun-bronzed face standing in the door.

"Good afternoon, Miss Charity." The tones were clear, brave, pleasant; somehow they suited the face.

The girl's head brindled a little. She had one of those heads that are never still, that are always restlessly swaying and fluttering about like leaves in sleepy winds.

"Good afternoon; won't you walk in, Mr. Taylor?" The voice was soft and steady enough, and so was Charity's face, for she was much engrossed just then in tying a "head" of flax to the distaff, with fingers not quite so steady as the voice and face.

"Thank you; I can't stay to sit down," answered the young man, as he crossed the door; "but Miss Parsons wanted me to stop in, on my way to the mill, and see if you'd have her cheese ready this week."

"O yes! I shall take it out of the press to-morrow."

The errand was accomplished, but somehow the young man lingered; and finally walked to the window a little awkwardly, and broke one of the lilac boughs from the trees, though the small pink blossoms had scarcely begun to tuft it.

"What a pleasant view you have from this south window," continued the visitor, looking out of the grove of pines, and off to the sea.

"Yes; I always bring my spinning here in the pleasant days."

This time the girl looked up and smiled, a smile that would have done the heart of any man good, but that did more than this to Reuben Taylor, who would have laid down his life for Charity Ames.

He drew a little nearer the girl. "The singin'-school's goin. to have a sail down to Rocky Beach, as soon as the moon gets large enough, which will happen by the last of next week; I should like to engage your company, if its agreeable."

The speaker caught his breath a little at these last words; but he got bravely through them, after all.

The spinning-wheel suddenly paused in its revolutions. Charity tapped the board meditatively with her foot. "I am much obliged to you, Mr. Taylor, and if I can be spared

She looked so sweet, gazing out with a lady-like self-possession at the distant sea, as composed as the sun on the carpet, though there were quick swellings and ebbings in the heart under that plaid dress, she looked so sweet that the bashful soul of Reuben Taylor was stirred within him, and before he knew it he had laid his hand on her shoulder, and broken out into an entreaty. "Oh come now, Charity; do say you'll go!" The words were not much, but the tones were.

The roses hurried into the girl's cheeks now, and she made a half coquettish movement backward; but the answer came pretty readily—"Well, I'll go if I can, Mr. Taylor."

The young man's deep brown eyes flashed with pleasure. "Thank you Charity. Truly I wish you'd call me Reuben, as you used to when we went to the old red school-house on the green."

"Well, we've grown older since then, you know"—making tactile investigations of her flax.

"Yes, I know; but somehow you'll never seem anything to me but little Charity Ames."

There was no mistaking the quiver in the voice now, no mistaking the blush in Charity's face either; but it fell back in a moment, and an arch light supplanted it, leaping up from her lips into her eyes, and she looked up with that little jingling laugh of hers. "And you will never seem to me anything but just the provoking, tormenting little rascal you used to be, Reuben Taylor!"

The young man laughed heartily at this very uncertain compliment; and after chatting a few moments more in the same strain, he put on his straw hat, bade Charity "Good afternoon," and got as far as the door, when he turned quickly back with a face struck into sudden seriousness. "Charity, it is not true that you are goin' to marry Squire Hemingway, as the neighbors say?"

Poor Charity! the hot flushes came and went in her cheeks. She opened her lips to speak, but something rose up in her throat, and beat the words back, and at last she broke down in a sob. "I shouldn't think you'd come here to insult me, Reuben Taylor!"

The young farmer was distressed beyond measure, especially as Charity buried her face in her little brown, dimpled hands, and continued to sob as though her feelings were aggrieved beyond measure. Reuben leaned over the girl, and laid his hand on the smooth, shining brown hair.

"Charity, won't you forgive me for asking that question? You know why I did it."

"No, I don't, I'm sure"—sobbing and keeping her face in her hands.

"Look up, then, and see." There was something in the tones that would be likely to secure compliance.

Charity Ames did lift up her flushed, tear-stained face, and Reuben took her hands in his, and said looking straight into her eyes, but with the muscles working about his mouth; "I asked you, Charity Ames, because I loved you better than my own life, and because my happiness for all time was bound up in your answer."

There was a mixture of tenderness and manly dignity in the young fellow's manner at this moment which no person could have been insensible to; his face was very pale with the struggle it cost his brave heart to make this confession, but every feature was struck through with a light that made it beautiful. Charity's eyes did not drop until he concluded; there was something in that face which magnetized her gaze to it.

"O Reuben!"—the voice and the gaze fell together, but there was that in both which Reuben Taylor understood.

He bent down by her, for she was crying now, but very softly. "I never meant to tell you this, Charity—though I've carried the knowledge in my heart for half a dozen years—until I had a home to offer you which should be worthy of you. But the truth has got out now, and there's no taking it back. It seems wrong to ask you to wait so long, but you know how it is—there's mother and Amy that I've got to look out for, and it's slow work pullin' up hill; but the thought that you'll make my heart brave and my hands strong, and, please God, I'll have a nest warmly lined for my sing-in' bird yet. Will you wait, Charity, little Charity?"

There was such tenderness flickering in and out of her name—it had never sounded half so sweet to her before; and the woman's heart leaped out, and engulfed in one mighty wave all the girl's timidity, and coquetry, and pride.

"Yes, Reuben, I will wait for you with a heart as brave and as patient as yours, no matter how long the time is."

You should have seen her face then; it looked to Reuben like the face of an angel, with the tears held in check in the blue eyes, and the light sifting through them as it sifts through vapors at sunrise. So they sat together in their first dream of love, and talked hopeful

The flavor of

Estabrooks' Coffee is always the same, because its quality never varies. If you picked one tin out of a hundred the coffee inside would be the same as in the other ninety-nine—rich, fragrant, temptingly good.

Sent on Approval

We know that you will be charmed with the New Scale Williams Piano.

We know that you will be delighted with its elegance and refinement.

We know that you will revel in its glorious tone—its tender touch—its magnificent action.

This is why we will select a

New Scale Williams Piano

—and ship it to you direct from the factory—subject to your approval

If, for any reason the piano which we select, does not give satisfaction, return it and we will pay the freight charges both ways.

Write us for full particulars about our Plan of Shipping New Scale Williams Pianos on approval, and buying them on Easy Payments.

THE WILLIAMS PIANO CO. LIMITED
OSHAWA, Ont. 115

In buying a cough medicine, don't be afraid to get Chamberlain's Cough Remedy. There is no danger from it, and relief is sure to follow. Especially recommended for coughs, colds and whooping cough. Sold by all dealers.

of the future—Reuben Taylor and Charity Ames. And the sort wind rumpled and tossed the apple-blossoms, and sighed and quivered among the pines, and the slow sound of the waves on the beach came in through the south windows which looked out on the sea.

At last there was a little click of the back gate latch, and Charity gathered away her hands quickly from Reuben's, and the color deepened in her cheeks.

"O Reuben! that's Joe comin' from school."

And this remark aroused the young farmer to the consciousness that it wanted but two hours of sundown, and the mill was three miles off, and if he got the two bags of corn ground that day which were now lying at the bottom of the old farm cart it wouldn't do to let "the grass grow under his horses' feet."

Charity stood at the window and watched her lover as he went down to the gate, and O how small to the heart of the true, loving woman looked Squire Hemingway's great house on the hill, with its handsome carpets, and its rich, old-fashioned furniture, and the new family carriage, and the fiery black ponies.!

Reuben Taylor and she had been playmates from their early childhood, for their families were neighbors. The first morning she had went to school she had been placed under Reuben's especial charge, and from that time the boy seemed to feel that "little Charity Ames" had large claims upon his good offices. He brought her the first ripe berries in summer and the earliest nuts in autumn; he carried her over the hills to school in winter on his sled; and so their lives grew and blossomed into youth and maidenhood in the quiet little village which sat betwixt the hills and the sea.

Then a terrible blow fell upon the house of Reuben Taylor. A neighbor of his father's, a hard, griping man, rich in fields and pastures, discovered a flaw in the title-deed which had given the old "Brook property" to the Taylors for three-quarters of a century. Farmer Taylor was a plain, honest, industrious man, though by no means an acute business one, and this late discovery of a flaw in the title-deed of the old homestead which had been his father's and his father's before him fell with crushing force on his spirits.

(Continued next issue.)

Vegetable Soup.

Select a soup bone which has good red meat, plenty of bone and a small amount of fat. Put on in cold water and bring slowly to a boil, then simmer slowly four hours. When partly cooked add salt and pepper. An hour before serving add two tablespoonfuls of rice. Cut fine in dice any vegetables at hand, carrots, turnips, potatoes or onions. There should be enough of these to make the soup thick.

Half an hour before serving add to the soup a pint—or more according to the family—of canned tomatoes, juice and pulp, and heat the whole to a quick boil. Now add the diced vegetables and boil briskly till they are done. Fresh tomatoes can be used in season when they should be added with the other vegetables. It improves the soup to allow the stock to cool over night and take off the fat which forms on the top. Then heat and add the vegetables. This can be made in a fireless cooker.

To Prevent Sunburn.

To women whose skin is sensitive and who suffer from sunburn or wind-burn in the summer, the long ride to town is a matter to dread. Even though the face is well protected from the sun, the hot wind produces almost as painful a burn. Avoid washing the face just before going out; it is better to do this several hours before hand, and without soap. Soap and warm water used at night will cleanse the skin so that soap need not be used during the day. Just before starting for a drive rub over the face a good pur, cold cream and over this apply talcum powder. This will form a coating over the skin that the wind and sun cannot penetrate, and it will prevent much discomfort. When the drive is over, wash the face carefully with warm water and just enough good soap to remove the cream. Dry by patting with a soft towel. This treatment is harmless for children if a good cold cream and talcum are used, and will save them painful burns.

Household Helps.

To keep a refrigerator pure and free from odors of food, put charcoal, either powdered or in lumps, in each compartment.

To keep cake moist, put half a lemon in the cake box. Renew frequently to prevent mold.

When cream is too new or too thin to whip well add gelatine. Dissolve one teaspoonful gelatine in one tablespoonful hot water and add to one pint cream, then whip as usual.

If we Only Understood.

Could we but draw back the curtains
That surround each other's lives,
See the naked heart and spirit,
Know what spur the action gives,
Often we should find it better,
Purer than we judge we should,
We should love each other better,
If we only understood.

Could we judge all deeds by motives
See the good and bad within,
Often we should love the sinner
All the while we loathe the sin;
Could we know the powers working
To o'erthrow integrity,
We should judge each other's errors
With more patient charity.

Nothing adds so much to the comfort and cheer of the home as an

OPEN FIRE!

For many years we have made a specialty of Fireplace Fixtures and if you are building or remodelling it will pay you to visit our warerooms or write to us for illustrations and suggestions.

We have a very complete stock of the following:

FLORICULTURE.

All enquiries in this department will be answered by H. E. Goold, Florist, Sussex, N. B.

Things to be Attended to This Month

Get busy with the hoe and keep all weeds out of the garden.

To keep cats, dogs and birds off the garden place chicken wire or brush over it. Do this until the plants are well up.

Do not water the garden unless it is absolutely necessary. After watering is begun it must be continued regularly until the next rain. Water the roots of plants and not the foliage.

After the young plants are up four inches begin to thin out, so that they stand at the proper distance apart. Always choose to keep the sturdiest of young plants.

Note the following distance for thinning some of the most common garden flowers: Alyssumn, 6 to 12 inches; Asters, 1 foot to 6 feet; Marigolds, African variety, 15 ins.; French Marigolds, 10 inches, and Dwarf varieties 6 inches; Zennias, 2 feet; Poppies, 9 to 18 inches.

The following vines are excellent for covering unsightly spots: Hop Gourd, Wild Cucumber, Ampelopsis, Climbing Nasturtium and Morning Glory.

Try a hedge of Castor Oil Bean plants.

One of the most valuable of annuals as an edging for the shrubbery border, is the Single Petunia, it blooms from spring through untill fall. A double row of Petunias at a trifling cost affords color all summer.

The Tom Thumb Nasturtium, whether in small or large masses, a double row of Pansies, in preference the lighter shades, will produce a charming bed that needs only constant picking to keep it blooming until frost. Moreover, the foliage of the Nasturtium has a distinct color value aside from the flowers and plants. It may be obtained of a pronounced dark shade of green, which, however, is a trifle too odd and striking to be used successfully in every situation, where a short, straight walk leads from the sidewalk to the house.

Petunias, when pinched back sufficiently, make a neat bed.

A very showy round or oval bed can be had by bordering a centre of Necotiana bloom.

The fact that the flowers are closed until late in the afternoon is a slight drawback, but then the fragrance, in a measure, compensates for this. To insure continuous bloom from Phlox the flowers should be removed as soon as they wilt. In making such a bed I have found that it is better to avoid the White Aster.

IN THE FLOWER GARDEN.

Keep the faded flowers picked off as soon as the petals fall. This will prevent seed formation, which means more vigor to the plant and in the case of annuals induce a longer season of bloom. Keeping the garden cleaned up makes it much neater.

Now is the time to look out for Geraniums that are to give flowers indoors during the winter. Select your plants and see to it that they do not produce any flowers this summer, pinch out all bud sas soon as they are seen.

Seeds of hardy prennials may be sown any time during July or August, if they can be gathered. If you want to have perennials flowering next year you must sow this year. "new crop", the earlier the better.

In vain thou weepest, in vain dost yearn,
Those three will never more return.
Constantina E. Brooks.

SIMPSON'S PREPAID EXPRESS

WE NOW PREPAY CHARGES TO DESTINATION

WITH the issue of our new Fall and Winter Catalogue, The Robert Simpson Company Limited, starts a new chapter in the mail order business of Canada.

To further develop our Great Mail Order System and spread its benefits to all parts of the Dominion, we will, until further notice, pay all charges on the great bulk of our shipments, and thereby put our mail order customers on an absolute equality with city customers.

Even if you live a thousand or more miles away, the goods will cost you just what they would in Toronto—no need now to figure out postage, express or freight rates because

The prices you see printed in this new catalogue are, with a few exceptions, exactly what the goods will cost laid down at your nearest railroad station.

This makes Every Railroad Station, Every Post Office, Every Express Office in Canada Practically a branch of this famous store.

Treatment for Warble Fly.

A correspondent in the Agricultural Gazette states that a very simple inexpensive, and effective way to prevent damage by warble fly is to dress the backs of all cows, heifers, and beasts with a little sulphur, at the time of the appearance of the fly, usually in July. He adds: "I have done so for over thirty years, and very seldom have had one warble to twenty cows and heifers in a herd of over 100 cows and heifers. We use an old tin with some holes made in the bottom with the sharp edge of an old file to dredge the sulphur on the backs from a little behind the hips to the shoulder, and rub it in well with the left hand as it is being dredged on. This is very easily and quickly done after milking, before the cows are untied. One man and myself have done fifty in about half an hour, and the sulphur when bought in a quantity, will not cost more than a penny per head. In very hot summers I have as a precaution, given them a second dressing. This may have been done, perhaps, four or five times in thirty years, but now I do not think it was necessary.

Clover Bloat in Cattle.

Clover bloat is one of the difficulties that we are called upon to treat at this season of the year. Thousands of valuable cattle are lost annually by clover bloat. This may occur in one hour from the time cows are turned out to pasture in the morning and is caused by the giving off carbonic acid gas formed from the large quantities of clover taken into the stomach. We often see cows turned on clover in the morning when the dew is on and are almost suffocated in an hour afterwards from bloat. The cause of the bloat is the over-filling of the paunch in too quick a time, before the stomach has time to act upon it, which sets up the fermentation. The way to avoid this difficulty is never turn the cows to clover while it is wet. It is especially dangerous then. Before turning cows to clover the first thing they should be well filled with other feed so that they will not eat the cloper too rapidly. After they have become accustomed to it they can usually be left in the pasture continuously without danger.

A cow with the bloat manifests symptoms of great distress. The sides are distended and when struck sounds like a drum. The afflicted animal is continually lying down and rising. The breathing is hurried and there is great suffering. If not speedily relieved the rumen will give way, burst or rupture. If this does not happen shortly the brain becomes unconscious and dies. The disease runs its course with fearful rapidity the farmer cannot usually wait for the veterinary, but must act himself, cast aside his timidity and plunge the largest jack knife he can find find or even a butcher knife into the side at at equal distances from the hook point and short ribs on the left side of the animal. In inserting the knife the blade should be extended up and down to leave a perpendicular slit rather than a horizontal one, which will insure a more ready healing, as the perpendicular slit will draw together much more rapidy than the slit in which the the weight of the abdomen will tend to pull it apart.

Nova Scotia Crops, Summer 1910.

Hay crop, immense; grain, potatoes, roots, excellent; pastures never better; live stock flourishing— in fact, a record year for the general farmer; but, fruit, a dismal failure. Such is the season of 1910. Even including the failure in fruit, it will be a great year for Nova Scotia. There will be fodder in abundance, and the farmer will be encouraged to multiply his live stock holdings, and those animals that he now possesses will be in better thrift and give greater returns than for years. And it will not be all lost in the fruit sections. The trees are growing and storing up food for other year's crops. This year's famine is the precusor of record fruit years to come.

SEASON OF 1910.

A mild winter was succeeded by an early spring. March and April were warm months and the grass was almost as forward by the end of the first week in May as it usually is at the end of that month. The last weeks of May and early weeks in June brought cool weather and copious rains. Several frosts were experienced during this period, notably on June 5th and 6th, when considerable damage was done. On lands that were naturally or artificially well drained, crops were put in from one to two weeks earlier than during the previous years; on wet, poorly drained lands, seeding was almost as late as in the previous years. At the present time, growth is much more luxuriant than for many years, but the crops are not any nearer maturity than at the corresponding time last year.

CROP RETURNS.

This crop report is based upon the estimates of 159 correspondents, representing every county in the province. Never have we seen our correspondents come so near agreeing upon the character of the various crops reported upon. The figures given represent the percentage of crop as compared with 1908, and also as compared with a so-called average year.

HAY—ESTIMATED YIELD.

	Upland	Intervale	Marsh.
Compared with 1909	123	112	120
Compared with average crop	121	110	118

Not a single correspondent reports less than a 100 per cent. crop, and several report as high as 200 percent. Newly seeded, well cultivated areas are producing almost as much hay as they could be expected to grow. Some correspondents write that the old lands are not much better than in former years. It will always be thus. In other countries crops must be rotated and lands frequently plowed and seeded if big yields of hay are to be expected Nova Scotia is no exception to the rule, although the procedure of many farmers would lead one to believe that they thought otherwise. Clover is more abundant than usual, which will make the hay all the more nutritious. In addition to the heavy yield this year, from 5 percent. to 10 percent. of last year's crop is being carried over. There is, therefore, in sight, at the present time, many thousands tons more hay than for years. Corresponding reports are being received from all Eastern Canada and the United States and everything points to low prices for this fodder. We would like to see a similar state of affairs

The Full Percentage of Cream

Getting the full percentage of cream from milk depends as much upon the oil used to lubricate the separator as upon the separator itself. Gummy oil will cut the fine bearings of your machine, spoil its balance and waste good cream in the skim-milk pail.

STANDARD
Hand Separator Oil

never gums, never rusts, never corrodes. It feeds freely into the closest bearings and insures the perfect lubrication that is essential to the free spinning of the bowl and the complete separation of cream from milk. It lessens the driving effort and lengthens the life of your separator.

One gallon cans. All dealers. Or write to

for years to come, for it would lead farmers to keep and raise more stock of all kinds, which seems to be the crying need if Nova Scotian agriculture is to be improved.

OATS AND OTHER GRAINS.

Compared with 1909 .....107 p. c.
Compared with average .....105 p.c.

On well drained lands, oats and other grains will be relatively as good as hay, but on the wet lands the crop will not be any heavier than last year and in some cases lighter. The general average is, therefore, abodt 11 per cent. lower than hay. Straw promises to be relatively heavy. There is about 5 per cent. more land in this crop than last year.

POTATOES.

Compared with 1909 ..... 95 p. c.
Compared with average.....100 p. c.

Estimates in regard to this crop are quite variable, ranging from 50 per cent. to 125 per cent. The same observations made in regard to the character of the soil in the discussion of the cereal crops apply to the potato crop. Potato bugs have been unusually troublesome, which is usually the case after a mild winter. However, it is yet too soon to say anything definite about this crop. The acerage of potatoes is about 5 per cent. less than in 1909.

TURNIPS AND OTHER ROOTS.

Compared with 1909 .....104 p. c.
Compared with average.....110 p. c.

The prospect for the root crop is extra good. There is an increase in the acerage devoted to mangles of 1½ per cent. and to turnips of 10 per cent. The prospects are, therefore, for 6a onsiderably larger gross return from these crops than for any previous year. This extra amount of roots will provide, along with the hay, a considerably extra amount of fodder for stock.

INDIAN CORN AND OTHER FORAGE CROPS.

There is about the same acerage devoted to these crops which are grown for the purpose of supplementing summer pastures. The yield will be about 10 per cent. higher than last year.

PASTURES.

Pastures are universally reported excellent and have been so ever since the middle of May. Cattle were generally turned out from ten days to two weeks earlier than usual. It is now the month of August and the pasture are almost as green as in June and there seems little likelihood of bare pastures this year.

CONDITION AND NUMBER OF LIVE STOCK.

There is about a 5 per cent. increase in dairy cattle. Beef cattle have been reduced about 1 per cent., and sheep, most unfortunately, still continue to decrease; this year it is estimated to the extent of 3 per cent. Several correspondents complain bitterly of the dog nuisance.

DAIRY PRODUCE.

Everything points to a record year for butter and cheese. Private dairying is growing and figures at present to hand in regard to factory dairying are most encouraging. The Scotsburn Creamery, for example, is producing nearly three times as much butter as last year, and last year's record was double the previous year. One new factory has been established, near Berwick, in Kings County, and several localities are considering the erecting of factories.

FRUIT.

We have finished the optimistic part of our report and now have to consider the most signal failure of the fruit crop since it became commercially established in the province. Several reasons have been adducted for the failure. The season opened unusually early, the fruit buds beginning to swell at least two weeks earlier than in the previous year. Frosts in the latter part of April, followed by cool, wet weather and severe frosts on June 5th and 6th are the explanations most frequently given for a crop that will not be more than one-quarter to one-third (1-4 to 1-3) as heavy as last year. With few exceptions, trees that bore heavily last year, which the majority did, are almost bare this year. Trees which failed to bear last year have, in some cases, a promise of a very good yield this year. The most promising variety is the Baldwin, followed by Spys, Kings and Ben Davis. There are odd sections where Gravensteins and other varieties are quite good, but, for the most part, they are almost a complete failure. The quality too promises to be poor. Owing to the small crop, many have ceased spraying and fungus and other diseases are greatly in evidence. Pears, plums and other fruits are also light. There is no question that the fruit growers will have to face a disastrous year. There are two consoling features. First, the foliage is luxuriant and the corresponding tree growth excellent. This will lay the foundation for a record crop some future year. Second, the orchardist who, in addition to growing trees, keeps stock and grows general farm produce will still have sometning for his year's work. It would be a blessing in disguise if such a year as the present would lead to his example being more generally imitated.

The following telegram just received from A. McNeil, Chief of the Fruit Division, Ottawa, offers a further consoling feature: "Eastern apple prospects lower than last month. Ontario winters very light. Eastern apples and pears, medium; plums, light; peaches good; raspberries, currants, gooseberries and grapes, average. United States apples below the average in Eastern States. Pacific States, full crop. Peaches, good; other fruit, medium. Great Britain, apples below average. Plums, poor; other fruits, below average. Continental apple crop, medium."

ACKNOWLEDGEMENTS.

This report has been compiled by Mr. A. J. Campbell, of the Office of Industries and Immigration, and has been edited by the undersigned. On behalf of all interested, I wish to publicly thank those correspondents from the various counties of Nova Scotia who have voluntarily contributed their estimates.

(Signed) M. CUMMING,
Secretary for Agriculture.

WHEN YOU VISIT THE BIG FAIR

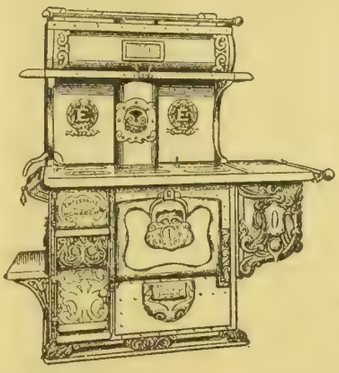
in St. John, Sept. 5th to the 15th, you want to be sure and see our exhibit in the Stove Department in the main building.

We will there show the

Enterprise Monarch Steel Range

With the new

DAYLIGHT OVEN.



This is the greatest improvement ever made on a range, and one that every housekeeper will be delighted with. Don't fail to look it over and at the same time see the many other striking features shown in the Monarch, which may be justly called Canada's Finest Steel Range.

When fitted for wood the Monarch takes a stick 26 inches long. The copper reservoir, which is detachable, holds 9 imperial gallons.

If you are unable to visit the fair, drop us a line and we will mail you descriptive circular with full information.

The Tussock Moth.

J. A. R., Kensington, P. E. I.—I forward you, under separate cover, a specimen of an insect. It is doing much damage in the orchard of Mr. J. E. Bagnell, Hazel Grove, and made its first apuearance this season. Mr. Bagnall would greatly desire The Farmer to distinguish the insect and to recommend means of eradicgtion.

Ans. The caterpillar specimen submitted for identification is the larva of the Tussock Moth. There is one generation of the Tussock Moth caterpillar a year. The moths emerge from early May until July or August, deposit eggs in clusters that do not hatch until the following spring. On hatching the young larvae remain clustered over the egg mass for a few days. Then a series of moulting periods take place before the cocoon is formed from which the adult moth finally emerges. The larger larvae often assume a wandering habit, which causes them to leave the orginal food plant and seek others, sometimes at a considerable distance away. As the female moth is wingless, and so heavy that it makes little effort to crawl about, the distribution of the species must take place exclusively in the earlier stages by the caterpillars crawling about and developing to full grown moths in new localities.

There are some parasites that are naturally enemical to the Tussock Moth. Spraying mixtures are not always effective in combating this pest. The more effective plan is to pick and destroy the egg clusters that may be found on the trunk, branches and twigs of the trees before they arrive at the hatching stage and prevent further infection by putting wide sticky bands around the trees which will trap the caterpillars as they attempt to climb the trees. These bands are effective as long as they remain sticky which is generally not more than a week. A mixture of equal parts of tar and heavy molasses or resin and castor oil melted together at the rate of 16 pounds resin to one gallon castor oil and diluted to any desired consistency by the use of more castor oil are very effective as a sticky substance to apply to the lands. If the caterpillars have been allowed to gain access to the trees they may be reduced below the danger point by beating the trees when many of the caterpillars will fall to the ground and be destroyed when they attempt to cross the tanglefoot band on the tree trunks.

The PUBLISHER'S DESK.

Modern lighting system result of 20 years progress. To-day is to illumination what the automobile is to transportation. (General idea on Gasoline as a power) Pituer Co oldest and largest in business. The only inverted light Cheap, easy to operat, durable. Insurance Companies cheerfully grant free permits for its use. No machinery. Safe for all lighting purposes. RETSON BROS., EAST COURT FARM, TRURO, N.S., WRITE—"Since advertising in your MARITIME FARMER we have made a good many local and export sales at prices ranging from $80.00 to $225.00. The highest price being received from the Wyoming Agricultural College for the large, white, four-year-old Ayrshire cow Gardrum Dairy Queen. This cow stood second as a three-year-old dry cow at the Fredericton Exhibition in 1909. She is a producer and we trust her to give satisfaction in her new home. You can rely on receiving our ads. in future."

THE TWO CENTRE PAGES of this issue are devoted to C. B. Pidgeon's announcement of valuable free gifts given to cash buyers. This is a plan of advertising which will appeal to all shrewd buyers, for besides the exceptional values which this store gives, the customers also receive the cost of advertising the goods in valuable and useful premiums. C. B. Pidgeon's store is situated corner Main and Bridge St., St. John, just at steam boat landings, thus making it the most convenient store in the town for people travelling on the river, for people travelling by train Mr. Pidgeon announces that he gives free car tickets after purchase is made. On all mail orders of $5 00 or more this firm prepays expressage, so that goods are landed at your door without the slightest expense to you. As the location indicates Mr. Pidgeon's trade is almost entirely with country people, and his immense stock of shoes and clothing is selected to suit this particular trade whtch demands most dependable goods at the lowest prices. If in St. John during exhibition this store will give you a hearty welcome and ask you to make their place your head quarters. If not convenient to go to St. John they take this opportunity to solicit your mail orders guaranteeing you their best services always and your money back if goods are not satisfactory. C. B. Pidgeon, Corner Main and Bridge St., St. John, is the place.

CHEAP FARES TO TORONTO EXHIBITION.—Remarkably cheap fares are announced by the Intercolonial Railway for the benefit of those who desire to attend the Canadian National Exhibition at Toronto. This great annual fair will be held this year from August 27th until September 12th and will have many new features and special attractions. Apart from the attractions of the Exhibition, a trip to Toronto at this season of the year is always enjoyable, and the reasonable rates that will prevail should prove an additional inducement to many travellers.

Round trip tickets will be issued on August 25th, 27th, 29th, 30th and 31st, and on Sept. 7th and 8th, at first class one way fare. On August 26th and September 6th, round trip tickets will be issued at a rate still more reasonable. All tickets will be good for return up to September 14th. These reduced rates afford chances for a cheap and enjoyable trip, and those travelling by the Intercolonial Railway will be enabled to reach Toronto by the shortest and quickest route from the Maritime Provinces The Ocean Limited, which arrives in Montreal at 7.35 a. m., connects with the Grand Trunk Intercolonial Limited, which leaves Montreal at 9 00 a. m., and arrives in Toronto at 4 30 p. m., saving hours of time. The Maritime Express, arriving in Montreal at 6.30 p. m., connects with the Grand Trunk night express for Toronto, leaving Montreal at 10.30 p. m., and arriving in Toronto at 7.30 a. m., the following day. Returning, travellers have their choice of the two finely equipped through trains out of Montreal, the Maritime Express, leaving at 8.15 a. m., and the Ocean Limited, leaving at 7.30 p. m., daily except Saturday.

AT MOUNT ALLISON.—The question as to where to send your son or daughter for further education is answered by the Mount Allison advertisements in last issue. There is no better preparatory school for boys than the Mount Allison Acabemy, one of the oldest of its kind in Canada. There is no better Commercial College in eastern Canada than the one in connection with the Academy. A residental school, the Academy and Commercial College is one in which the most thorough instruction is given under conditions which make for the proper development of character.

The Mount Allison Ladies' College—which includes the College of Literature and Science, the Conservatory of Music, the Massey Treble School of Household Science, the Oratory Department, the Owens Museum of Fine Arts—is the largest in Canada. All its teachers are specialists, the members of the Conservatory staff having been trained in Europe. Its equipment is extensive and thoroughly modern. The school aims to be, and is a home-like institution where the development of the individual student along all lines is sought. In this fact is to be found the reason why the school has attained its leading position.

A calendar of the Academy and Commercial College will be sent free on Application to Mr. J. M. Palmer, M. A., Sackville, N. B. The Ladies' College Calendar will be seut free if application for it is made to Dr. B.C Borden, Sackville, N.B.

The attention of our readers is drawn to the advertisement of the Enterprise Foundry Co. in this issue. This company have one of the largest and best equipped foundries in this country and their stoves are now being sold in every province in Canada.

At the Dominion Fair to be held in St. John between Sept. 5th. and 15th., which no doubt every reader hopes to attend, they will make a very comprehensive display including the Enterprise Monarch Steel Range, the Enterprise Blazer Hot Air Furnace, as well as a full line of their other well-known and popular stoves.

The central features of their exhibit, however, will be the new Daylight Oven as applied to their Monarch Range. This consists of a Glass Oven Door made in three panels from glass that has been specially made and thoroughly tested They have been working on this improved feature for a long time in order to prove entire practicability before placing it on the market. Those who have seen this glass door are immediately struck with the advantages it offers and the wonder is that it has never been thought of before. By its use the contents of the oven can be seen by merely glancing through the door without having to open it. It is certainly most credi table to the enterprise of this company that they should be the first to introduce this entirely new improvement. We heartily recommend our readers to make a point of seeing this exhibit.

THE RURAL SCIENCE SCHOOL, TRURO, N. S.—The Rural Science School for teachers, which was convened on July 12th at the affiliated Nova Scotia Agricultural College and Normal College, closed its session on August 12th. There was an enrolled attendance at thisschool of 136 teachers, of whom 53 took Physical Drill alone and 83 took classes in connection with the Rural Science course, which is provided each summer at these institutions. This summer session was a very successful one and the teachers in attendance put in a most profitable part of their holidays studying plants, birds, insects, rocks, soils, and at the same time, observing the operations in connection with the Agricultural College Farm. The underlying idea of this school is to give the teachers in attendance a deeper knowledge of the science related to agriculture and other industries, so that they can teach these to better advantage, more especially in the rural schools and thus lay a foundation for more intelligent application of agriculture in the various spheres of industry. When teachers have completed the full course laid down in connection with this Rural Science, School, which will require from two to three vacation periods, as well as interim study, they will receive the Rural Science Diploma and, when evidence is given that they are putting their teaching into practice, will receive an extra Government grant.

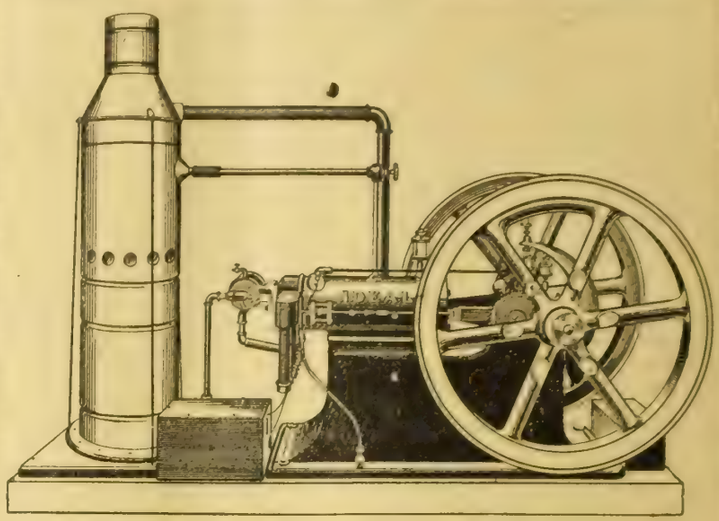
SPECIAL AWARDS AT DOMINION EXHIBITION—Silver trophies, medals, extra cash, etc., in addition to $25,000 prize money.

Over $25,000 is to be distributed at the Dominion exhibition in St John, N. B., September 5th to 15th next, in awards for live stock, agricultural, and horticultural product, dairy shows, poultry, horse exhibits, women,s work and educational department. This is a magnificent sum, made possible by the very generous grant of the Federal, Provincial, and Civic Government: A strenuous competition has thus been induced in all the departments above mentioned with the result that even in face of the fact that new buildings have been erected and a general rearrangement of spaces affected there is scant, if any room for an over-plus of exhibitors. In addition to the cash prizes of $25,000 there will be magnificant silver trophies, gold, silver and bronze medals, diplomas and badges of merit.

FREE Trip to St. John Exhibition for YOU!

If You are Thinking of Buying

A Gasoline Engine.



READ OUR OFFER

DURING THE BIG DOMINION EXHIBITION IN ST. JOHN, N. B., SEPT. 6th to 15th, we make the following extraordinary proposition to any or all farmers interested in the use of a Gasoline Engine on their property.

To anyone purchasing from us a Gasoline Engine for farm uses, we will cheerfully write a check for the purchaser's bill of expenses to and from St. John. This means all reasonable outlay, such as fares. board, lodging, lunches, exhibition, etc.

We make no extravagant claims, merely stand firmly behind our "Ideal" Engines and will guarantee absolute efficiency and satisfaction.

You May Try Them First,

Pay Afterwards !

Our "Ideal" Engine cuts labor bills in two at sawing, threshing, grain-grinding, pumping and other kinds of farm work.

In the agricultural section the rovincial Chemical Fertilizer Company Ltd., f St. John, offer cash awards to bona fide rowers, and Messrs W. A. Tlee Burpee & Com-any seedsmen of Philadelphia, make similar ash awards, as does the Bowker Fertilizer ompany, of Boston Mass. Numerous other nedals will be awarded by the Exhibition As-ociation and industrial sections as well

James L. McAvity
of the McLean Holt Co., St. John.

One of the most interesting and enterprising irms in the province is the firm of McLean Holt & Co., manufacturers of the famous Glen-wood Ranges,and all sorts of railroad and other astings. This enterprising firm is owned by Jas. L. McAvity, who though a young man has leveloped great business ability and is connect-d with several of the largest bussiness firms n the province outside the McLean Holt Co. He is also commanding officer of the 62 Fusilers, nd a director of the N. B. Telephone Co. The oundery of this company is situated on Court-ney Bay which will be utilized by the Grand runk Pacific Ry. in the near future, thus im-roving the shipping facilities of this range for which there is an increasing demand. The plendid fitted up salesroom which has recently een enlarged and repainted and in which the Pitner lighting system has been enstalled is situated at 155 Almon St., where visitors are al-ways welcome to inspect and purchase these xcellent ranges. This department is in charge f R. H. Irvin, who has proved his worth as a nanager and salesman of a retail stove store. During the past 16 months Mr. Irvine has sold 43 ranges or over 21 a month on an average.

When asked about the wonderful success of he past 16 months Mr Irvine said he considered t due to the quality of the article he had to sell nd to the way that Mr. McAvity allowed him o advertise, also to the co-operative work of wner and employees in general. This firm will ave an exhibit at the Dominion Exhibition, where visitors can get an idea of this famous ange.

ACADIA LADIES SEMINARY.—The Catalogue of Acadia Seminry whose advertisement appears elsewhere in our columns has come to our table. An examination of this booklet which is admirably printed and illustrated shows that the work of this well-known school, which, during the last six years has more than doubled its attendance of resident and non-resident pupils is organized in three departments. The Acadia Department includes the Collegiate, the Sophomore and Freshman Matriculation Courses, making provision both for those who desire to supplement and continue the ordinary work of the public school and for those who desire to prepare for college. The Department of Fine Arts includes courses in music, Pianoforte,voice, violin, with the usual Thoretical branches, Art of oil, water and china painting, together with work in arts and crafts, and oratory, graduation from which course prepares the pupil for entrance with advanced standing into the leading schools of expression on the Continent. The Department of Practical arts offers courses in Household science, business, stenography and typewriting. All of these courses are characterized by breadth and thoroughness and aim not merely to prepare the pupil for technical fitness for the arts of profession but for complete living. To do this work a staff of twenty teachers, qualified by training, temperament and experience is employed, Because simplicity in living and dressing, high ideals of conduct and thoroughness in work are insisted unon, because the location of Acadia Seminary is ideal, both in respect of beauty of euviroment and healthfulness, because the standard of simplicity offers the very best educational advantage for the minimum expense, Parents who appreciate values in education are more and more turning to Acadia Seminary as the one school which offers the largest and best returns for the smallest possible outlay. We notice also that a fully qualified Physical Instructor and a Trained nurse have the care of the physical life of the pupils. Full particulars concerning the work of the school in its various departments may be had from the catalogue which will be sent free upon application to the Principal, Rev. H. T. DeWolfe, D. D., Wolfville, N. S.

Be sure and take a bottle of Chamberlain's Colic, Cholera and Diarrhoea Remedy with you when starting on your trip this summer. It cannot be obtained on board the trains or steamers. Changes of water and climate often cause sudden attacks of diarrhoea, and it is best to be prepared. Sold by all dealers.

1 Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only one cent a word, you can advertise anything you wish to buy, sell or exchange. The address must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issue. No black faced type or display of any kind will be allowed under this head, thus making a small ad, as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARKETS.

Halifax Prices.

GRAIN—Oats, 53c.

FEED STUFFS—Bran, $22,00; shorts, $25.00; oil-cakes, $2.15 per bag; linseed meal, $2.15 per bag; cottonseed meal, $2,15 per bag; gluten meal, $1 50 per bag; corn meal, $1,65 per bag.

DRESSED MEATS—Beef (carcass), country, 8½c to 9c; veal, 8½c; lamb, 12c per pound; pork, 12c per pound.

HORSES—Drafters, $200 to $300; roadsters, $250 to $350; carriage, $150 to $250.

DAIRY PRODUCTS—Creamery butter, prints, 26c; solids, 24½c to 25c; dairy butter, tubs, 19c to 20c; prints, 20c to 22c; cheese, twins, 12c to 12½c; large, 11½c to 12c.

POULTRY AND POULTRY PRODUCTS—Eggs, fresh, 21c; fowl, 13c per pound; chickens, 90c per pair; ducks, 75c per pair.

FRUIT—Apples, $3.00 to $5.00; pears, $1.00 per 11 quart basket; plums, $1.00 per 11 quart basket.

VEGETABLES —Potatoes, $2.10 per bbl.

MISCELLANEOUS—Hay, $14.50; straw, $10.00; wool, 21c white, washed; beef hides, 9c to 9½c; calf skins, 14c to 15c per pound; sheep skins, 30c to 40c.

MARKET REVIEW AND FORECASTS.

The butter market remains unchanged. Supplies still continue to come forward freely. Owing to good pasturage, the market continues good and prices have not advanced as usual at this time of year.

CHEESE.—The market continues weak in sympathy with Ontario and Quebec prices.

EGGS.—These have become scarce and prices have advanced sharply and receipts are of only fair of ordinary quality, still higher prices are looked for.

APPLES.—Mature apples are now coming forward, but from all reports the outlook is anything but bright for a good yield.

Ontario fruits are now coming on this market in car lots and will so continue until the end of October.

Charlottetown Prices.

GRAIN.—Oats, 40c to 44c.

FEED STUFFS.—Bran, $1,25; shorts, $1.50; middlings, $1.50; oil-cakes, $2,25 to $2,50; corn meal, $1,90 to $2.00.

LIVE STOCK.—Butcher's cattle, 5c to 5½c; stockers, 4c to 4¾c; milch cows, $35.00 to $45 00; sheep, 3½c to 4½c; lambs, $3 50 to $4.50.

DRESSED MEATS.—Beef (carcass), 9c to 10c; beef (retail), 12c to 16c; mutton 9c to 11c; veal, 5c to 6c; lamb, 11c to 12c; pork, 9½c to 10c.

HORSES.—Drafters, $125 to $200; roadsters, $150 to $225; carriage, $150 to $225.

DAIRY PRODUCTS.—Creamery butter, 22c; prints, 23½c; dairy butter, 17c to 19c; cheese, 10½c to 10⅝c.

POULTRY AND POULTRY PRODUCTS.—Eggs, 16½c to 17c; fowl, 10c to 12c; chickens, 50c to 75c per pair.

FRUIT.—Apples, 20c per peck; raspberries, 5c pound; currants, 12c to 16c.

VEGETABLES —Carrots, 60c to 80c; potatoes, new, 60c; turnips, new, 35c to 40c; beets, 60c to 80c.

MISCELLANEOUS —Hay, loose, 30c to 35c; pressed, $7 00 to 18 00 per ton; straw, $5.00 to $5.50; wool, 23c; beef hides, 8½c; calf skins, 10c sheep skins, 30c; lamb skins, 25c.

MARKET REVIEW AND FORECASTS.

Not much to report in the way of market changes. Hay is lower, but very little changing hands. Oats are easy and our quotations are about market value for shipping, the outside price being for black. New potatoes are now on the market and will soon be plentiful. New oats will be offering within a week or 10 days. Cheese market was easier last word; sales were made at 10½c. Butter is firm at 22c for creamery, but dairy is in good supply and prices are easy, only fancy would bring higher prices. Beef is plentiful as is usual at this season and we look for lower prices. Trade in general is good and the prospects are for an abundant harvest in all lines, except small fruits, which are scarce and price above normal.

St. John Prices.

With the opening of the Dominion Exhibition less than two weeks distant, there is naturally a universal movement of preparation for what will doubtless be by far the largest influx of visitors during any ten days in the history of the city. The visitors to former fairs in St. John will be at once struck with the enlargement of the grounds and buildings for this year's exhibition, and the great improvement made in the system of arrangement There will be a much greater variety and more exhibits and special features than have been seen at any previous fair in St. John, and never have such arrangements been made for special excursions and for housing the visitors

Wholesale merchants are making preparations to extend courtesies to out-of-town customers, and a feature of exhibition time will be the meeting together of men in all lines of trade, and such exchange of views on trade matters as will doubtless be of much benefit to all concerned

At the present time trade generally is quiet, but conditions are sound. The farmers expect to harvest good crops, and price are favorable to the producer. The dairymen are having an excellent year. The fishermen have not had a very good season.

There have been some changes in quotations since last report. Oatmeal is higher. Beans, cheese, butter, and eggs have also advanced.

Flour and meal.—The only change is in oatmeal, which has advanced. Hard wheat patents, $7 to $7.05; choice patents, $6,25 to $6 35; medium patents, $6,05 to $6.15; oatmeal, $5.50; cornmeal, $3.40 to $3.45.

Provisions.—Pure laid is easier, there is no other change. Domestic mess pork, $29 to $29.50; American plate beef, $20 to $20.50, Lumberman's XXX, $15.50 to $16; lard, tub base, 15½c.; compound 13c to 14c.

Beans.—The price has advanced and there is likely to be a further rise, as American buyers have picked up considerable quantities in Ontario The present quotation is $2.20 to $2.25.

Produce —Prices have advanced. Cheese is now quoted at 12c to 12½c; butter, 21c to 22c for choice tubs; and eggs at 20c per dozen and rather scarce.—Maritime Merchant.

C. H. SHAFFNER, SOUTH FARMINGTON, N. S.—I regret that I have to report a short crop of apples in this section. Probably not more than 25% of an average crop. Other farm crops, such as hay, grain, potatoes, etc., are very fine, probably 20% above the average, particularly the grain crops.

J. HOWE COX, CAMBRIDGE, N. S.—The apple crop here in the valley is nearly a failure. Some of our best varieties, such as Gravensteins, Ribstons and Blenheims are total failures. The best crops are found along the south range. I estimate not more than one-third of last year's crop. Quality, poor. Prices will likely rule high.

J. E. SHAFFNER, LAWRENCETOWN, ANAP. CO., N. S.—I regret to say prospects for fruit in this section of the valley are not bright. We will not produce more than ¼ of the season's crop. The quality is off also, spot being quite prevalent. We are having a very fine season for all crops, outside of the apples, and with seasonable rains the fruit should grow to a large size, which will help us to a certain extent.

L. O. NEILY & CO., AYLESFORD, N. S.—In regard to the prospect for the fruit crop in this section for the coming season, heavy frost the last days of April did very much injury to the buds, as they were much further advanced than for any season for years. Again on June 4th we had a heavy frost which did considerable more damage. Taking the apple crop as a whole, there will not be more than one-third of last year's crop. Pears are at present looking fairly well and will probably be an average crop. Plums are a light crop, especially in some sections and will not be more than 50% of a crop. Cranberries are about a total failure.

W. A. MACKAY, MANAGER SCOTSBURN CREAMERY, PICTOU CO., N. S.—The present year promises to be the most prosperous one here for the farmers for many years. The hay crop is just about all gathered in and is the heaviest and got in in the best shape for a long time. The weather has been almost ideal for hay making during the past two weeks, only a couple of small showers interrupting the work. Grain and root crops are also promising good. Much more attention is being given to dairying than formerly and nearly all are noticed patronizing the creamery, rather than making the butter at home. The output of butter for July was over 23,000 pounds as compared to about 8 000 pounds a year ago and 4,000 pounds in 1908. The supply for August is keeping up well. Many are starting to feed green feeds to their cows. Prices for butter have ruled high all season and prospects are for higher prices, soon as the make gets smaller.

Montreal Prices.

Butter, 21¾c to 23c cheese, 10¾c to 11¼c; oats, 38c to 41½c; wheat, $1.01 to $1.03; corn 70c to 71c barley, 48c to 49c; buckwheat 54c to 55c; hay, No. 1, $12.50 to $13.00; No. 2, $9.50 to $10,00; No. 3 $8.50 to $9 00; clover mixed, $8.50 to $9 00; straw, $5.50 to $6.00; eggs, 21c to 22c; hides 8c to 10c calfskins, 12c to 14c; lambskins, 30c each.

Meet your friends at the Maritime Farmer Tent at the St. John Exhibition.

HORSEMEN ATTENTION!

Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. They cure Cough, Cold, Distemper, Colic, Glanders, Spavin, Pink eye and all diseases of the Horse.

TRURO, N. S.

Dear Sirs,—One of my horses had a bad cough, and I made a complete cure with three bottles of Dr. J. Woodbury's Horse liniment. The cough was of twelve months standing. In my large expeience with horses, I consider this liniment to be the best made for all diseases of the horse, and I recommend it to my friends.
E. J. ANDERSON.

BEAR RIVER, N. S.

DEAR SIRS,—
We do not hesitate in recommending your Dr. J. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts, and would say that no lumberman should be without it.
Yours truly,
CLARKE BROS.

The MARITIME FARMER will have a tent on the Exhibition Grounds at the Dominion Exhibition, St. John. Make it your headquarters while attending the big fair. Plan to meet your friends there. Pens, Ink and Stationery will be supplied Free.

EUREKA CYCLONE ANIMAL EASE

Makes Horses, Cattle and Sheep glad, as it keeps the Flies from annoying them; is a vermin killer as well as a fly killer; a cleanser and disease preventer. Clean and easy to use.

Agricultural Societies and Education

ONE of the most potent factors next to the Agricultural College, and agricultural literature, in stimulating the young men of Maritime Canada to higher efforts along the line of modern agricultural methods is a well organized agricultural society. Under its auspices Institute meetings are held and through its various channels a steady stream of practical informatian is being dispensed.

Not unfrequently one hears the remark, from some persons who attended a society or institute meeting, which was addressed by some authority on agriculture, "I did not hear anything that I did not know something about before." This may be true, but, have you been putting into practice that "little something" you knew about the subject. If not, the oftener you hear the fact repeated the sooner will you be led, almost involuntarily, to put into practice what you know. It is a well known fact that to some the ideas set forth at these meetings are revelations along their line of work of which they had not previously been informed and which they will eagerly grasp and strive to follow, as the light creeps in that shows them where they can improve on their past methods. It matters not, then, how feeble the effort for advancement that is put forth by an agricultural society or an institute some one will benefit therefrom as surely as day follows night.

But not all our readers are members of an agricultural society. To those who are still beyond the pale of the agricultural society, we would say: If there is not an agricultural society in your district, "get busy," send for particulars re the organization of agricultural societies, to the Secretary of Agriculture for your province and he will gladly assist you in the work of organization. Interest your neighbors in the matter and in a short time the difficulty of not having an agricultural society will have been overcome. In cases where an agricultural society exists and some farmers stand aloof and refuse to cast in their lot with their fellow men, perhaps through prejudice or some personal feelings, our advice would be: "Don't". In matters pertaining to agriculture, if you would not wish to be a clog on the wheels of progress, cast aside all prejudice and personal feelings and join with your fellow farmers in advancing your common cause. Instead of using the expression "if they would do such and such" which is so often heard, stop using the third personal pronoun "they" and in its place use the first personal pronouns "I and we" as the occasion requires and go forward to make the agricultural society in your district, better because you are a member, always remembering that the success of any society is measured by the interest that is taken in it by its individual members. The various agricultural society secretaries are now preparing their membership lists for the year 1910-11. If you have not already become a member and are too late to send your name and fee today be sure to send early tomorrow. It is only a matter of a few weeks until the secretaries will be called upon to hand in their lists, so do not delay lest you forget.

The following article on Agricultural Societies and Education," an address by President W. J. Black, of the Manitoba Agricultural College, Winnipeg, before the annual convention of the Ontario Association of Fairs and Exhibitions and which although addressed to Ontario farmers is just as applicable to Maritime Province farmers and will be read with interest by our readers who are now agricultural society members and should give an impetus, towards joining to all those who are still outside the fold of their district agricultural organization :

"As representatives of the Agricultural Societies of Ontario, I take it that you are public-spirited citizens, interested in not only those things which go to develop your own Province, but those of all Canada. In my experience, the leading men in Agricultural Societies, and those whose mark is most worth while are those who never get properly paid for their efforts, but who continue on from year to year, working in the interests of their community.

"In a recent address, J. J. Hill, that noted railway builder and master of the science of commercial economy, said: "The American people have many problems of a political, economic, and social nature to settle, but none so important as the true relationship of the nation to the soil." If we apply this statement to our conditions in Canada, we will agree that this is our greatest problem also. The soil is the life of the nation; upon the extent to which we develop our agricultural resources and the intelligent use that is made of them, depends very largely the future greatness of Canada.

"No other natural resource in this country is comparable with nature's storehouse of plant food within the soil. In the year 1908, according to estimates furnished by the Department of Statistics at Ottawa, Canada produced from the mines, forests, lakes and fields, including live stock, about $960,000,000 and of that amount 85 per cent. came from the farms.

"It is estimated that we have not less than three hundred million acres fit for cultivation, only forty millions of which have yet come under the plow. We, therefore, stand in need of a vast increase in population; we need immigrants, intelligent, capable and willing to work, and to learn how to make the soil productive. We need likewise improvements in our agricultural methods. Looking at conditions in agriculture we have to conclude that the wealth of the farm is in its waste.

"In many of our most important manufacturing industries, there has been great advancement in recent years in the matter of making of value products otherwise wasted. Indeed, it is conceded that in such industries as meat packing a comparison of present-day methods with those of fifteen years ago shows that sufficient is being gained by the introduction of new methods to pay the cost of running these plants. It is probably not too much to say that were the average manufacturing concern managed with as little attention to the elimination of waste as there is given to farming, it would not be in existence any length of time. We shudder as we investigate conditions.

"In this Dominion on our cultivated lands we lose by noxious weeds alone more than five times as much as is being spent for the maintenance of our colleges, schools and universities. In the West, being a land of newer occupation, wasteful methods prevail more generally, perhaps, than in this Province. A careful estimate has led us to the conclusion that our waste from weeds alone is not far short of ten times the amount paid for educational purposes.

"Some time ago I had occasion to ask a class of young men coming from different Provinces of Canada to name on examination the practices in farming which they considered most wasteful. From their replies I received such answers as this :

1. Feeding farm horses, idle in the winter, a ration much more expensive than an equally nutritious one.
2. Keeping for dairy purposes cows unsuited for the purpose.
3. Sowing dirty seed.
4. Shipping valuable constituents off the farm.
5. Growing grain to sell only.

These and three score others were given, any one of which, upon careful examination would show on an average a considerable loss.

"The most immediate need of the time, therefore, is Education; and I mean to interpret that term in its broadest sense—Education, that which fits individuals for their life work. By your Act of Incorporation you are educational organizations. Your object is stated to be the promoting and improving of agriculture. By awarding premiums for live stock, for agricultural machinery, and production of grains and vegetables; by organizing plowing matches, holding seed fairs, growing farm crops, etc., you aim to improve conditions in agriculture; to demonstrate teach, inspire and educate. You stand by your Act of Incorporation as organized instruments to direct the minds of the people to the conservation of our agricultural resources. You exist to educate against waste, to demonstrate that the highest conception of the nation is that of a trustee for posterity.

"Great discoveries have been made in the realms of science during the last few years. Many old industries have been transformed, and many new ones have come into existence as the result of the quiet, patient work of the scientist in his laboratory. Even our social life and customs are changing rapidly by the more general use of such appliances as the telephone and motor car; and yet it is a well-known fact that no industry at the present time is making less use of science and its revelations than agriculture.

"Every vocation or calling in life stands before the public in accordance with the intelligence of the men who represent it. No industry demands more fully a combination of intelligence and energy than farming. The necessity for energy need not be discussed. It is apparent. It is evident also that we must as a nation keep pace with the development of other nations. We must prepare to place the products of our soil upon the markets of the world at as low a cost and at as great a profit to the producer, as the people of other countries receive for theirs. Having in mind our debt to posterity, we must see to it that the men of the next generation are now being afforded proper facilities to prepare themselves for the mighty struggle of competition.

"Improvements in transportation have brought us closer to other countries; and it is no longer a trip of three weeks by passenger steamer to London, nor one of two months to South America. Every year the nations of the earth that place their food products on the same markets as we do are being drawn closer together.

"Two of the most significant movements of modern times are the accumulation of wealth and the increasing desire for education. The

nations which are progressing most rapidly, undoubtedly, are the nations which are paying most attention to technical education. Take, for example, Germany. Thirty years ago the people of that country set about to establish technical schools in which their boys and girls might become proficient in the application of science to the production of the various essentials to human existence. So great was the advantage found to be derived from these practical institutions, that the German people have found it desirable to increase them greatly in numbers, the result being that, as they did so, the cost of producing the various products of their industry has become less, for it always follows that in the application of science to production, the cost is lessened. The result of this far-sighted policy on the part of this European nation has been very clearly seen in the recent political struggle in England. We are told that the products of German industry have been in some cases displacing those in the home land, because they are purchasable at a lower price.

"Most Canadians believe it to be our duty to contribute in some form to the Empire's Navy, in order that the great nation, of which we are proud to be a part, may remain naval mistress of the seas. We seem to consider Germany our chief competition in this struggle, and yet we overlook very largely the desirability of being able to compete with such a great country for future commercial supremacy. Should we not, in aiming to be a part of a great navy, aim with equal earnestness to have the steamers that leave our ports for the foreign markets heavily laden with those things which should be worthy of the protection of a great navy.

"Other countries have started later than Germany to emphasize technical education, and the results of their efforts are already noticeable. Japan may be mentioned as one of these, because the rapid rise of the Japanese people can be attributed to no single factor so much as the emphasis which they have placed on education. During the last fifteen years the brightest young men of this oriental country have been found in all the leading universities of the world. They, in many instances, received funds from the home government to enable them to be educated in the universities of the United States, Germany and England, afterwards returning to become the people's official advisers in organizing institutions and drafting laws best calculated to make that country a strong competitor in the race of nations.

"But, apart from the development of a sentiment that will stand out in support of Canadian industrial expansion, and recognize the value and importance of agricultural knowledge, the Agricultural Societies of Ontario can do great things in a practical way towards making this country rise to its opportunities. You are already doing a grand work. Your exhibitions and fairs are great educational institutions.

"I shall never forget the great privilege I enjoyed a few years ago when called upon to report upon the progress of the Norfolk Agricultural Society at Simcoe. Although I had been as a boy a member of four different Societies in this Province, I got a new conception of the educational value of a fair. The extent to which Secretary Murphy and the directors endeavored to make the judges, provincial officers and newspapers feel "at home" was inspiring. The way Superintendent Kydd of the horse department and others with him strove to make the most of the exhibition from an educational stand point; how the wheel of fortune fakir was obliged to camp on a vacant lot far back in the town, instead of on the Society's grounds; how the professional horse race with its winners so often picked before the race begins was absent; and best of all, how the people kept coming, remaining all day, and went away seemingly satisfied and happy. All in this picture has come back to me hundreds of times in the discharge of my duties as an adviser of Agricultural Societies in Manitoba. Since that day I have learned to be a firm believer that fairs are just as useful and as educational as the directors managing them believe they can be.

"Men who are interested in the improvements of the methods of teaching agree that the eye is as important an agent as the ear. We learn to do things by seeing them done, much better than by being told merely how to do them. You teach men how to produce good horses and cattle by showing them the results of the efforts of the man of skill in the science of breeding. It is your opportunity as an exhibition association to present ideals to the people. You do this in your exhibits of grains, vegetables, fruits and other products of the farm, but you are coming to a time when you will do even more to make your fairs educational than you are doing at the present time. I say this knowing that you are aiming to make the best of your opportunities to have old Ontario stand out as a bulwark in Canadian prosperity.

"I am told that there are fairs in this Province that have not yet learned to appreciate the necessity for having a judging ring for live stock. Anyone who has judged horses knows how difficult it is to satisfy one's self, much less the exhibitors, regarding the merits of competing animals, when the crowd is allowed to gather very close. I am told, too, that hogs are exhibited where no unloading facilities are provided, the result being that they are judged in the wagons, the public having no opportunity of studying their merits. It seems to me that your Department of Agriculture would be justified in withholding a grant from such fairs.

"Then there is the much debated subject of giving reasons for placing animals. Capable judges are always ready to give some reasons to exhibitors who desire them, but it is not always thought to be fair to the man who showed and lost, to have his horse, for example, criticized for the benefit of the public, unless he knew when entering that he might be called upon to submit his animal for consideration in this way. I believe it is always possible for a capable judge to tell the ringside what would constitute an ideal in each class.

"Good judges, I know, are not always ready speakers, but a short explanation when the awards have been made in each class inspires the public with confidence in the judge. No single feature of a show can do more to increase its future patronage than the creation of a feeling among exhibitors that the judging was conscientiously and skilfully done. The giving of reasons need not apply to livestock exhibitions alone. We are certainly moving on towards a time when exhibits will become greater object lessons, and the fairs something more than the farmers' show window.

"As we look on into the future we see a spreading out, an enlarging of the fundamental functions of Agricultural Societies, viz., Education and Improvement. Your Standing Field Grain Competitions I expect to see enlarged upon until all the operations of the farm are considered. Growing choice, clean seed is only one of the important operations carried on in summer on your farms.

"In the Province of Manitoba we have held during the last two summers what we call "Good Farming Competitions," our object being to emphasize good farming by attracting attention to the farms on which the best theories of modern agriculture are being put into practice. We are strong believers in demonstration work. When we get back to the soil to consider our own weaknesses, we must all agree that one of the greatest problems of to-day is better farm management. Talk when you may with the average farmer, and you will find he knows how to do much better than he does. Many of us are very good theorists, but not nearly so good in practice. "The spirit seems willing but the flesh is weak." So we in Manitoba try by our good farming competitions to draw attention to the men who, as we say in the West, "are doing things."

"Now in any competition of this kind you are apt to assume that the man who has the best pure bred stock and the finest buildings always wins. This is not true, however. We have a very interesting score card which we try to follow in order that the man who is doing most to improve conditions can get a fair show. Perhaps the man with the pure bred stock secured the animals from someone else. Anyone who has money may go to the shows and buy good stock from among the prize winners. Money also can provide good buildings. What our judges look for in live stock, herds and flocks, is evidence of improvement. They expect to find the animals of better average quality than their dams. The man who has a good grade herd and is improving it is given the fullest consideration. Where buildings are elaborate we expect to find them modern in construction and equipment.

"In following out this score card, we often find that the farmer with a comparatively small, plain outfit of buildings in good repair with tidy yards, well cultivated fields, giving evidence of good management about the place, wins over the fellow who has nearly twice the capital invested in his plant.

"But, before concluding, I want to emphasize another good feature of the agricultural fair that should never be overlooked. It is the value of competitions. They are good for humanity. They educate men to be truer gentlemen. In a show ring, perhaps, anyone may be a winner, but it takes a gentleman to be a good loser. Is it not one of the best sights of our fairs to see a fellow who has lost big enough to congratulate the winner, with the remark, "I intend to win next time"!

"Yes, the population of Canada is increasing and must increase rapidly. Your own vast stretches of northland must fall before the woodman's axe and yield to the pioneer's plow. Hundred and thousands of young men will come from other climes to gain a knowledge of agriculture from your farms, and they will go on perhaps with your sons to see these new lands. While they are with you your fairs and your exhibitions will teach them much that should be of value to them in conquering greater Ontario.

"I rejoice as I see you stand in support of your Legislature in aiding all institutions of agricultural learning. I look with great pride to Ontario, as I see you introducing agriculture in your secondary and high schools, as I see you appreciate the advantages of learning among the agricultural classes.

"Your agricultural societies will do a noble work for the next generation in preparing our people to compete with other nations that strive with Britain in their efforts to become greatest. Let us, then, in serving the interests of our community, contribute to make this a greater country of enlightened and happy homes, a land where education is ever more free, and where agriculture is honored amongst the most dignified of occupations peculiar to it."

Do Mangels and Sugar Beets Cause Kidney and Bladder Stones in Rams?

Stockmen have long been under the impression that sugar beets and mangels when fed to breeding animals will in some way cause the formation of renal and urinary calculi, or kidney and bladder stones. In order to determine just how far such an opinion is justified, a series of experiments covering five years was carried on at the Iowa Experiment Station.

OUTLINE OF EXPERIMENTS.

During the years 1904-05 two rams were fed mangels at the rate of 6 pounds daily in addition to a ration of clover hay and one-half lb grain. As a check two other rams were fed only hay and grain. The feeding continued from January 20 to March 1. From March 1 to March 15, sugar beets were used in place of mangels, the supply of mangels having been exhausted. Subsequently all rams were turned on pasture. No ill effects were observed either during the experiment or afterwards. During the year 1905 none of these rams were fed mangels as the supply of roots rotted in the cellar. Their ration was hay, grain, and corn silage.

During the year 1906-07 two other rams were added to the experiment, making three in each lot. All rams were fed a ration of hay and oats until March 1, when the experiment of 1904 was repeated. The urine of the rams was also examined for sugar, albumin, volume, specific gravity, and solids.

One of the lambs in the lot receiving hay and grain died during this experiment. The feeding ended May 15. The five lambs then living having been confined 76 days were given the freedom of a box stall to accustom them gradually to exercise. They were then turned on pasture for the summer, and apparently remained in perfect health. In the fall one of the rams from the lot receiving mangels was slaughtered and his organs examined. They were in all respects normal and no stones were found in either kidneys or bladder.

During the year 1907-8 two ram lambs were added to the experiment to replace the one that had died and the one that had been slaughtered. The six animals were divided into three lots of two rams each. All animals were fed on a ration of 1.1 pounds of corn daily in addition to all the hay they would eat. After the first 20 days one lot was fed sugar beets in addition to the hay and grain, and, similarly, a second

lot received mangels. The roots were increased during the next 40 days to 17.6 pounds daily besides corn and some hay. The animals were fed in stalls so that the urine and feces could be collected for examination. The experiment began December 14 and ended April 9 and included examinations of feed, urine and feces. At the end of the experiment one animal from each lot was slaughtered. A small calculus was found in the kidney of the sugar beet fed ram. The kidneys of the mangel fed ram were enlarged, while the kidneys of the ram receiving hay and grain only, were normal.

Since the calcus had formed in the sugar beet fed lamb, it was decided to repeat the experiment another year and to increase the number of animals in each lot sufficiently to determine whether the formation of this calculus was accidental or could be traced to the use of roots. Therefore during the year of 1908-9, a total of 42 rams were fed as follows :

Eleven received hay and grain (check lot.)

Nine received hay, grain and corn silage.

Eleven received hay, grain and mangels.

Eleven received hay, grain and sugar beets.

The feeding began September 11 and ended April 14. On January 14, two animals from each lot except the one receiving ensilage were were placed in stalls and their feed, feces and urine were weighed and analyzed daily. On January 31 ram No 440, sugar beet fed lot, died after being sick one day. The bladder contained several calculi too large to pass through the urethra.

On February 11 ram No. 415, mangel fed lot, died after being sick two weeks. The bladder could not be examined as it was eaten by a pig that was in the yard. The kidneys were much broken down, being very soft and pliable.

On February 18 ram No 472, sugar beet fed lot, was killed after being sick two days. His bladder was ruptured, highly inflamed, and contained many small calculi.

On April 11 ram No. 11, sugar beet fed lot, died after a short illness. The bladder contained many small calculi.

Thirty-two of the remaining rams were sent on April 21, to the Agar Packing Company in Des Moines. They were slaughtered in the presence of Doctor Hugh G. Welpton, president of the Des Moines Pathological Society, who examined each carcass together with the internal organs.

The kidneys of all the hay and grain fed rams were normal. The bladders of five of them were normal while in the other four the bladders were slightly affected. The hearts of all these rams were normal as well as were the livers, gall bladders, and other organs.

Of the hay, grain and ensilage fed rams six showed all internal organs entirely normal. In one of the others the kidneys were slightly affected, while the remaining ram showed a slight affection of the bladder. All other organs were normal.

Of the eight rams receiving hay, grain and mangels, every one had bladder and kidneys more or less affected, while many of them suffered from affection of some of the other internal organs as well. The same was true of the seven rams that had been fed hay, grain and sugar beets. One of these, No. 429 showed a large number of calculi in the calyces of the kidneys.

The complete results of these slaughter tests are given in the regular edition of this bulletin, which may be obtained by writing to the director of the Experiment Station at Ames.

The four animals that had been fed in stalls, and whose feed, feces, and urine had been examined for a period of one hundred days, were slaughtered at Ames. The results were much the same as in the case of the other rams. Hay and grain fed lambs 5 to 9 had normal bladders, kidneys, hearts and gall bladders. Mangel fed ram No. 7 had an enlarged bladder and enlarged kidneys with loose capsule. The kidneys were mottled and stained, of soft texture and pale color. The heart and gall bladder were enlarged Sugar beet fed ram No. 10 showed an enlarged, ulcerated bladder; an enlarged kidney containing a small calculus; and an enlarged heart and gall bladder.

EFFECT ON DIGESTIBILITY OF DRY MATTER.

The rams receiving roots digested an average of 11.10 per cent, 12.27 per cent more of the dry matter in their ration than did the rams receiving only hay and grain.

EFFECT ON RETENTION OF DRY MATTER.

Early in this experiment we noticed that while the urine execreted by the rams receiving roots was greatly increased, the specific gravity of the urine was not correspondingly decreased. This was due to an increased elimination of solids by the increased volume of water passing through the kidneys, and the increased amount of solids and salts taken into the body. The dry matter thus eliminated by the kidneys was subtracted from the dry matter digested, and the difference was called "dry matter retained."

While mangel fed rams digested 11.10 per cent more dry matter than the dry fed animals, they retained only 3.32 per cent more. That is, they lost through the kidneys 8.47 per cent more of the dry matter taken into the body than did the the dry fed rams. In the same way the sugar beet fed rams lost 3.80 per cent more dry matter than did the dry fed rams. This increased loss of dry matter is due to the leaching effect of the increased amount of water contained in the roots.

EFFECT ON THE GAIN MADE.

The following comparison is based on the gains made in 1908-9 by the lots of nine rams each that were fed over a period of 215 days. The daily average gain by the lot receiving hay, grain and mangels was .292 pounds; by the lot receiving hay, grain and sugar beets, .291 pounds; and by the lot receiving only hay and grain.229 pounds.

EFFECT ON DRESSING PERCENTAGE.

The sugar beet fed rams dressed 5.80 per cent higher and the mangel fed rams 3.85 per cent higher than did the dry fed rams.

EFFECT ON COMPOSITION OF THE BODY.

The first influence of feeding roots on the composition of the body is to facilitate the deposition of fat in the tissues. The flesh of the mangel and sugar fed rams contained an average of 55 and 52 per cent fat respectively, against an average of 40.87 per cent contained in the flesh of the hay and grain fed animals. However, individuality plays a very great part in determining how much fat is deposited. In 1909 the carcass of dry fed ram No. 9 contained 46.64 per cent of fat, and that of sugar beet fed ram No. 7 contained exactly the same percentage. The water, ash and nitrogen were also about the same. But excluding ram No. 9 from the averages the meat of the root fed rams was much fatter and dryer than that of the dry fed, although containing less protein and less ash. The fat of the root fed rams was well interlaid between the muscles, giving the cuts a beautifully marbled appearance.

EFFECT ON ORGANS OF THE BODY.

Almost without exception the vascular system of the rams receiving sugar beets and mangels was affected. The bladders, kidneys, nearts, and gall bladders were enlarged or otherwise affected. In most of the organs and often in the muscular parts of the body there were hemmorrhages due to the breaking down of the capillaries.

EFFECT ON THE KIDNEYS.

Because of the large amount of water contained in the beets and mangels—over 90 per cent—the animals eating them execreted large amounts of urine. This urine carried with it increased amounts of salts—urea, phosphates, etc. The first apparent effect of this increased activity of the kidneys was an increase in their size. This was accompanied by a softening of the texture, paling of color, and loosening of the capsule. The kidneys were "soggy" to the extent that often with little effort they could be pinched in two between the thumb and finger. As the kidney tissue was broken down, it offered nuclei on which the phosphate salts could crystallize, forming small calculi. Many of these were too large to pass from the kidney, and were cemented together to form larger ones. Others passed into the bladder, irritating it greatly. As these stones accumulated and increased in size, they finally obstructed the urethra, thus preventing the escape of the urine. As a result the bladder became distended, highly inflamed, and was finally ruptured.

CONCLUSIONS.

1. Sugar beets and mangels favor the formation of renal and urinal calculi, or kidney and bladder stones when fed to breeding rams.

2. It is very probable that these roots have the same effect when fed to ewes or to cattle.

3. In view of the fatal results often attending the formation of these stones it would seem inadvisable to feed sugar beets and mangels to breeding animals.

4. There is no particular danger in feeding sugar beets and mangels to fattening animals, as the calculi are not likely to develop sufficiently during the fattening period to cause serious results.

Weeds.

In any locality, new weeds, like new insect pests, are from time to time making their appearance. Were the farmers to recognize these vegetable foes and to realize their possible troublesome, they would spare no pains to check their progress at the start. In most cases noxious weeds can be easily kept out if the effort is made before they get well established.

The methods of introduction are numerous. The Canada thistle, perennial sow thistle, ragwort, milk weed and dandelion are wind distributed. In seed oats it is often hard to detect the wild oats that may be present. Some weeds follow the course of streams or ditches, while burdock stickweed and common burr, get a free ride to many a station on a sheep's back. But the most common method of introduction is the weed seeds that come in our clover and grass seeds. Not one farmer out of a hundred knows a bad weed seed from a clover seed. So long as the price is right they do not care what the package may contain—and it might not be out of place to say right here that the farmer who buys any grade but the best, is only buying that many more weed seeds; it is graded and priced according to its purity.

As a rule all weeds are exhaustive of soil fertility. Many of them so choke the grain crop as to not only injure the yield of grain, but impoverish the soil as much as the crop sown. In this respect the thistle, troublesome as it is in many parts of Canada is far from being the worst offender.

A great deal was said at New Glasgow a few months ago, about Ragwort, many who are not interested, as their counties are not as yet infested with the weed, taking very little thought as to the real danger there is from this weed. With all that has been written and said about the dangers of this weed, and the enormous damage it has caused to horses and cattle and with all the efforts that have been put forth, it is still on the increase, has this past year made steady progress toward taking possession of the waste lands, and vacant farms and at the present time the weed is as far ahead if not farther than ever. It has already over-run all the eastern counties. It has appeared in Colchester County in several places. At Debert it has already gained a foothold and down the line as far as Stewiacke and Shubenacadie, showing that the railroad is the means whereby it is distributed over the province. If it is not checked, in fact completely eradicated wherever it shows, it will ere many years over-run the whole province.

The railroads should be compelled to eradicate any and every weed that grows along their tracks, terminals, and crossings. The farmers think it is not much use to cut and destroy weeds, when the highways and railways are completely infested with them.

In fact, the highways are a scandal, and are hotbeds for the growth of all kinds of pernicious weeds.

By all means let there be laws stringent enough enacted and enforced against individuals, municipalities and railway companies, or else our province will be taken possession of by the many dangerous weeds that are in our midst, and are coming from the West year by year.

A. HECTOR CUTTEN.

The Halifax Exhibition.

The 14th annual exhibition of the province of Nova Scotia opens at Halifax, September 28th to October 6th.

The prize list which has been distributed some months ago is practically the same as for last year with the addition of some extra money in the Horticultural Department.

This exhibition deserves the support of the agricultural people on the grounds that the prize list has been kept up in their behalf notwithstanding that we have not been able to make two ends meet.

When we had the Dominion Exhibition in 1906 we increased the prize list in proportion to the grant and have since kept it up to a standard far in excess of any prize list offered by a Provincial Fair east of Toronto. We take no exception to the name any fair assumes, but it is worth while for the exhibitors to read the prize money offered then draw their own conclusions.

The Commission ask of those in the agricultural and live stock interests their favorable consideration by sending in their entries before September 10th, at which date entries close.

The accommodation given to the live stock people is not to be excelled any where and the Commission ask fair treatment in the way of entries from all those engaged in these pursuits.

Entries close September 10th.

THE MARITMIE FARMER

And Co-operative Dairyman.

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers, and Dairymen's Association of New Brunswick; The Nova Scotia Farmers' Association The Nova Scotia and P. E. Island Fruit Growers' Associations The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers Association, and The New Brunswick Poultry Association.

Subscription Price $1.00 per year. **When paid in advance 80 cts.** Persons taking advantage of the 80 cent rate when subscribing are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definite order for discontinuance is given.

The date after your name on the little green label on front Page is, in every case, the time which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser be said :—**"I saw" your adv. in the MARITIME FARMER.**

THE LURE OF THE FARM.

At a recent gathering of the graduates of one of the great universities in the Middle West, who reside in a large city some distance from their almmater, the question of selective courses and occupations came up for discussion. The men who discussed it were all members of the professions. Some were lawyers, some teachers and some engineers. Preliminary to a general discussion of the topic a vote was taken to indicate, if the opportunity offered, what course each man present would now select. Every man present save one expressed a choice for the agricultural course. The man who did not vote with the majority explained his position by saying that he was raised on a farm and left it thirty years ago.

The choice made by these men is not hard to analyze or understand. The college man who was in the hopeless minority had graduated from the farm before the new era in agriculture made its appearance. He knew of the advances made in the field of industry he deserted, but this knowledge had not reassured him that the hardships and unpleasant things he was familiar with as a boy had been overcome.

But these things have been overcome, at least to a very great extent. The men who have no vivid recollection of the seamy side of farm life can and do realize this fact fully. They see that the farmer has been emancipated. The education he receives now, either in college or through the dissemination of demonstrable theories and facts by means of government bulletins and agricultural papers, has enabled him to rise above the unpleasant conditions which made his life somewhat cheerless a quarter of a century ago.

With this release from drudgery has come an ability to reap a richer reward for his labors. He has learned what crops to sow and plant, what breeds of stock to raise, when to plow, how to fertilize and how to intelligently harvest and market his crops. The dairy, a few years ago a makeshift and a thing apart, has been made a joy and a source of income. Other things, the telephone, rural free delivery, good roads and good prices, have combined to make the farmer's life not only endurable, but enjoyable.

The men who made this somewhat suggestive selection of a single avocation certainly did not voice what is supposed to be but man's inordinate dislike for his own profession or occupation. Had this been all, the almost unanimous vote would not have been for agriculture. The fact is that modern processes have dignified farming and raised it up to and above the level of the ordinary professions.

MORE ATTENTION TO FARMING.

Though farming always has been, is, and must ever be the basis of the world's industrial activity, yet it has never received the attention it has merited. Most men have followed it more as a fate than a vocation. A youth of to-day, standing on the threshold of life, confronted by the momentous necessity of choosing his sphere of labor, of taking his place among the millions of competing toilers, too often turns his back on the farm and casts his lot with those who are already congesting the business and professional avenues.

Why does he leave the only field which to-day is not overcrowded for one where the laborers are many and the harvest small? The answer is not far to seek. There are two reasons. One is a prevailing notion that farming is a sort of vulgar occupation. No more false or pernicious notion could be conceived. The dignity of farm labor was recognized by the Romans and they gave to it the benefit of the best minds they procured. Romes' greatest poets sang of the beauties of rural life and her historians cronicled the wealth of her rural classes, but all feared when Rome in her hour of need called her soldiers and statemen from the plow, and they passed away before the approach of a more splendid but far less substantial age.

The second reason, that farming is unremunerative, is true only to the extent that one fails to bring to the management of his agricultural business the same degree skill of that the business man brings to the management of his business interests. Too many farmers leave everything to the seasons and soil, and acting on the consoling assurance expressed in the old adage that God takes care of the lame and the lazy, see their buildings run down and their farms run out. This class of farmers are those whom we hear forever complaining of the hardness of their lot and the unprofitableness of farming. We retain memories of these men. Their sleds were housed during the summer and fall under the open sky; their wagons were sheltered the same in winter; their mowing machines, rakes and plows were found when needed where they were last used the year before. If finally the sled broke down with a load of wood, or the cart with a load of hay, or the mowing machine gave out in the half mown field, they would invariably curse their luck. We are no belivers in luck. What is termed good luck is the result of good calculation and bad luck is the result of bad calculation. We believe if every farmer should bring to the management of his business that same degree of careful and systematic supervision that characterizes every other branch of industry today, his success would be practically assured. His returns would not of course be large, but the balance would be on the right side of the ledger. There would be no six percent mortgage to torment his peace and devour his substance. Thousands have grown rich out of his toil and thousands are still growing rich. Too long the wealth he has created has flowed into the pockets of those whose only tille rests on nothing firmer than connirance and cunning. He must take his lesson from the events transpiring in the great industrial world about him.

Education, organization and co-operation are to bring to the farmer his full share of the fruit of his labors. Much along this line has alread been done in the Maritime Provinces by the Nova Scotia Agricultural College, Farmers' Institutes and kindred societies, but much more remains to be done.

On another page of this issue will be found "Notes from the Nova Scotia Agricultural College" from the pen of its efficient Principal, Professor Cumming. The work that has already been done by the impetus given to Maritime farmers by the long and short courses at that grand institution is inesteimable. More and more of our young men are "taking hold" of the old farms and carrying on, in a systematic manner, the work that was begun by their forbears. You will find announcements re the 1909—10 courses on other pages of this issue. It is not to early to consider sending that boy of yours to the Agricultural College—its the place for him if he expects to follow an agricultural course. It may mean some sacrifice to you but think of the lasting benefit to the boy. Plan to let him attend the college this winter ; he will enthuse new life into the farm work when he returns and if you yourself can manage to spend a fortnight in January at the short courses with the boys, by all means do so, no matter whether you are seventeen or seventy you will enjoy the course and profit by its teachings.

RIDING BACKWARDS.

Did you ever enter a railway car, finding the seats all taken but a reversed one, you took that and rode backwards? How rapidly everything seemed to be leaving you! No matter how beautiful the scenery, how many flowers decked the wayside, how many sparkling brooks crossed, or how many delightful retreats glided by, you saw nothing until you had passed it. And then it hurried away, away in the distance until it was lost from sight. You were scarcely made sensible of a new beauty until it had gone by you, and you had of it only an unsatisfactory glimpse.

How many of us are thus riding backwards through life! We appreciate the beautiful things around us, and we long to enjoy them, but scarcely do we see them until them are gone. Blessings come and blessings go, but we do not recognize them until they are passed, and then our hearts are filled with a sad longing for their return. Friends surround us and would make us happy, but too often we do not know it until they, too, are gone. Then we grieve over their departure, but our tears cannot bring them back. Our eyes are turned only to the past, and the things we love are getting farther away from us. We are riding backwards.

Turn around. Face the front. Look to the future. See the beauties as they unfold themselves before you. Go forward to meet the blessings as they come, enjoy them as they go by, and treasure them in fond memories when they have passed on.

Life, indeed, is like a railway on which we are all passengers. What we get out of it depends upon how we are riding. Let us keep our eyes to the front, and be prepared to meet our friends as they approaeh us, to greet them with smiles of recognization and appreciation, to give kindness in return for the kindness they have in store for us, and thus gather flowers on the journey rather than see none but what are already rushing beyond our reach. The past may be sacred as it is held in memory's strong casket, and we may turn our heads sometime to gaze upon it fondly but the future is Hope's fruitful garden in which God has planted sweet flowers to perfume and make glad our passing way.

Look ahead to see the blessings,
Never back to bring a sigh ;
Life's great train is hastening onward,
Hope and Heaven are drawing nigh.

IN FAIRNESS.

Mention this journal in writing our advertisers. We have rendered service in bringing you and an honorable dealer in touch. You receive value ; he receives value ; let us have credit for our part.

EDITORIAL NOTE.

The farmer without a good pasture, surrounded by a reliable fence, close to the buildings, is incomplete. Such a field need not be large, but it will be of great value to turn work horses into over night and in many other ways.

Notes From the Nova Scotia Agricultural College.

The next session at the Agricultural College, Truro, N. S., will open on November 1st, 1910. The attendance at the college has been steadily growing, but it is not yet commensurate with either the equipment of the institution or the importance of the agricultural industry in the Maritime Provinces. Have you ever thought of attending the college yourself or, if you are a parent, have you ever thought of sending your boy? Consider some of the advantages.

1.—The college affords an agricultural education. The student will learn the constituents of soils and plants and, hence, the principles which should guide him in his farm practice, the constituents of manures and fertilizers and how to mix and apply these intelligently, the use of farm machinery, how to judge select, care for, and make profitable all kinds of farm stock, the treatment of animals in disease and how to perform veterinary operations, the principles and practice of fruit growing, dairying, poultry, carpentry, blacksmithing, etc.

2. In addition, students will study English, Arithmetic, Bookkeeping, and such other subjects as are taken up in the general High School and College courses.

3. No tuition is charged. Board will average $3.50 per week for 22 weeks. Books, $10.00 to $15.00. These, with railway fare, are all the necessary expenses. Any industrious student can earn on the farm from $15.00 to $25.00 during the term. We do not know of any institution in Canada where an education can be obtained at less cost.

4. The term is from Nov. 1st to April 15th, the least busy season in the year.

5. Most of the students return to their farms. A few go on and prepare themselves for professional work. Those who have graduated from the Nova Scotia Agricultural College and studied at Guelph and other institutions have, almost invariably, stood at the top of their classes and are unanimous in stating the advantages of a course at the N. S. A. C.

6. Agriculture is much more remunerative than formerly, but competition is becoming all the keener. The 20th century farmer, if he is to succeed, cannot afford to be without a better education along agricultural lines than his father had. Surely the boy who will devote his life to agriculture can be afforded from the farm during two short winter terms, during which to acquire a better knowledge of his life's profession so that, as a citizen, he can hold his own with men of other professions.

7. The college is equally free and available to students from all the Maritime Provinces, as well as to those from abroad who purpose settling in these provinces.

Send a letter or post card to the undersigned and get fuller information in regard to the courses.

(Signed)
M. CUMMING,
Principal Agricultural College.

Prince Edward Island Crop Report

The following is the report of the crops and the conditions of the live stock in Prince Edward Island under date of July 25th, 1910.

Hay.—The hay crop this year is excellent, both in quantity and quality. The clover crop came through the winter without injury, but received a severe freezing on the nights of June 4th, and 5th, from the effects of which it did not fully recover. The timothy is very long and fine weather will now make the hay crop one of the best ever gathered in the Province.

Wheat.—The outlook for the wheat crop is good. Last year several correspondents reported that the Joint Worm could be avoided by late seeding, but this year several reports say that the Joint Worm is doing injury even in fields sown on June 7th. It is too early to estimate the damage likely to be done by it.

Oats.—The reports of the oat crop runs from 65 per cent. to 150 per cent. There has been too much rain for the lower-lying, heavy soils, particularly in the Western part of Prince County, but the crops never looked better on the dry, light lands. At this time of year the crop has seldom looked better.

Barley.—Except where sown in rather low land, the barley is excellent. Sixty-eight correspondents have reported this year on this crop, a considerable increase over former years.

Peas.—Peas are grown almost altogether for soiling purposes, or to be cut green and made into hay for winter feed for cattle. They are sown with oats at the rate of 2 bushels oats and 1 bushel peas per acre. The growth up to the present time is much above average.

Corn.—Fifty correspondents have this year reported on corn. By the of June it looked as if the crop would be a complete failure. The warm weather in July however, brought it on very rapidly, but up to the present time it is much below average.

Potatoes.—There seems to have been a considerable miss in the crop this year, particularly in Western Prince, but no cause is assigned by any correspondent. The potato beetles are more abundant in sections than they have ever been before, and there is no doubt but that the crop will be reduced on account of them.

Roots.—With a few exceptions the prospect for the root crop is excellent. In some cases a second seeding was necessary, but the weather has been so favorable that this is not likely to lessen the yield.

Fruit.—The frosts of June 4th and 5th, did very much injury to the fruit crop. There will be very few early apples this year and only about half a crop of fall and winter varieties. Plums will also be very scarce and cherries are almost a failure. Strawberries were about a 65 per cent. crop, gooseberries 60 per cent., currants a little better, and blueberries are reported as likely to be scarce. More interest is being taken in spraying and orchards are better cared for in general. A few new orchards are being planted, and the growing of strawberries is becoming more general.

Pastures.—The pastures never were better. Cattle were turned out about two weeks earlier than usual. Frequent showers have kept the grass green and the prospect is that little soiling will need to be done till late in August. The prospects for fall and winter feed are much better than usul.

Dairy.—Reports received from 32 factories and creameries show an increase of about 23 per cent. in the amount of milk received this year over that received last year up to July 15th, while the increase in the number of patrons is less than 2 per cent. and in the number of milch cows about 5 per cent. The increase is due mainly to better feed and better care of cattle. There seems to be some improvement in the quality of the milk although one factory reports returning 3000 lbs. of milk on Monday, July 11th. The price of milch cows has increased about 12 per cent.

Eggs—Reports show an increase of about 19 per cent. in Kings County, 8 per cent. in Queens County and 21 per cent. in Prince County.

Farm Help.—The supply of farm labor is not as scarce as it was last year. Two correspondents report it sufficient for every one that reports it scarce. The wages (with board) paid are as follows:

	Prince County.	
	Per Day.	Per Mos.
Lowest reported	$ .65	$13.00
Highest reported	1.50	18.00
Average reported	.94	16.00
	Queens County.	
	Per Day.	Per Mos.
Lowest reported	$ .75	$14.00
Highest reported	1.40	20.00
Average reported	.93	18.00
	Kings County.	
	Per Day.	Per Mos.
Lowest reported	$ .75	$10.00
Highest reported	1.25	18.00
Average reported	.86	13.00

There is an advance of about 5 per cent. in the cost of labor over 1909.

Weeds.—Some of the worst weeds, particularly Tansy Ragwort, Orange Hawkweed and Wild Mustard are spreading rapidly. In the new meadows there is an abundance of Night Flowering Catchfly and some Bladder Campion, Rib Grass and Curled Dock. Yarrow and Mouse-ear Chickweed are doing considerable damage and Sow Thistle is taking a heavy toll from the grain crops. Six weeds reported by the largest number of correspondents are Ox-Eye Daisy, Canada Thistle, Sow Thistle, Yarrow, Wild Mustard and Night Flowering Catchfly. The following are also reported: Daisy Fleabane, Couch Grass, Mouse Ear Hawkweed, Evening Primrose, False Flax, Black Eyed Susan, Green Fox Tail, Ball Mustard, and Chicory.

LIVE STOCK.

During the month of June, 1907, a census of live stock of the Province was taken and the results were as follows:

	Prince County.
Milch Cows	x 16,798
Other Cattle	x 18,608
Horses	x 11,094
Sheep	x 25,087
Pigs	x 14,355
Geese	—.....
Hens	x .....
	Queens County.
Milch Cows	x 16,741
Other Cattle	—19,773
Horses	x 12,363
Sheep	x 26,089
Pigs	x 20,035
Geese	—.....
Hens	—.....
	Kings County.
Milch Cows	x 12,011
Other Cattle	x 10,614
Horses	— 6,978
Sheep	x 20,285
Pigs	—10,777
Geese	—.....
Hens —	x .....
Increase x	
Decrease —	

If the number of each for 1907 be represented by 100, the number of each for 1910, will be represented as follows.

Counties.	Turkeys	Geese.	Hens.	Pigs.	Sheep	Other Cattle.	Milch Cows.	Horses.

Enumeration of Census Values.

The farm and urban values of the census of 1911 will be enumerated under the date of 1st June. They will include the real estate and live stock values of each enumeration district at that date, of the live stock and nursery stock sold in 1910, of the dairy products consumed at home, sent to factories or sold, and of the animals slaughtered on the farm in the same year, together with values of other products of the farm.

Land and buildings and farm implements and machinery owned by every person in the enumeration district will be recorded separately for values in 1911, and the rent of land and buildings will also be recorded if leased in that year. Values will be taken for orchard fruits, small fruits and vegetables separately for 1910; but values of horses, milch cows, other horned or neat cattle, sheep, swine, poultry and hives of bees will be taken separately for 1911, at the date of the Census.

The values of live stock and nursery stock sold in 1910 will include horses, milch cows, other horned or neat cattle, sheep, swine, poultry and hives of bees, and of nursery stock, which means fruit and ornamental trees grown for transplanting into orchards, gardens and parks.

Dairy products consumed on the farm, and sent to factories or sold, refer to products of the year 1910. They include the values of milk, cream, home-made butter and home-made cheese.

Animals slaughtered on the farm in 1910 will be recorded for the value of horned or neat cattle, sheep, swine and poultry. Horses are not included in these values, as in our country their meats are not used for food.

The values of other products of the farm include those of eggs, honey and wax for 1910, and wool, maple sugar and maple syrup for 1911.

The enumeration of hired labor on the farm refers to the year 1910. It will give the total number of weeks of labor employed, which means the number for all men who work for hire on the farm, and the total amount paid for hire, including allowance for board. The payment should be reckoned for the full time of service, and should include the value of board. The inquiry relating to earnings for domestic service is asked for in Schedule No. 1.

In addition to the foregoing inquiries of values, a question is asked for the value of all lands and buildings not manufacturing establishments or mines owned in Canada in 1911 which are outside of the enumerator's district.

A country teacher of my acquaintance asked a nurseryman whose son was in her school to talk to the pupils about the subject of budding and grafting. The man brought his knife and several young trees and actually set buds and coins, while the children crowded around breathless with live interest, listening attentively to his descriptions, and even trying a hand at the work themselves while the man directed them. Never was there a better nature lesson. Many teachers can follow this suggestion.—Selected.

HORTICULTURE

The Greatest Fruit Show Ever Held in New Brunswick Will be Held Next November.

New Brunswick fruit growers are again reminded of the big fruit show which is going to be held in St. John, N. B., early in November of this year. An opportunity is to be given to all New Brunswick fruit growers to come forward with their exhibits and show what their province can produce in the fruit line. The show will be held under the auspices of the New Brunswick Fruit Growers' Association, and the Provincial Government has granted five hundred dollars in prizes to be awarded as follows:

CLASS I.

(Open to all New Brunswick.)

Sub-Class A..

Best plate of five apples.— McIntosh Red, $3.00, 2.50, 2.25, 1.75, 1.50, 1.25, 1.00, 75c.; New Brunswicker, $2.50, 2.00, 1.50, 1.00, for each variety. Bethel, Alexander, Wolfe River, Fameuse, Dudley's Winter, Milwaukee, Duchess and Wealthy.

Sub-Class B.

Golden Russet, King of Tompkins, Northern Spy, R. I. Greening, Bishop Pippin, Talman Sweet and Ben Davis, $1.50, 1.25, 75c. for each variety.

Sub-Class C.

Princess Louise, Gravenstein, Ribston, Blenheim Pippin, Maiden's Blush, Grime's Golden, Gano, Stark, Baxter, Arctic, Wagner, Fallowater, Roxbury Russett, Ontario, Salome, Winter St. Lawrence, Milding, American Baldwin, Canada Baldwin, MacMahon's White, Rolfe, Scott's Winter, N. W. Greening, Tefosky, Blue Pearmain, Cox's Orange, Longfield, Crimson Beauty and any other variety, $1.00, 75c, 50c. for each variety.

CRAB APPLES—Best plate of 12.

Sub-Class D.

Transcendent, Hyslop, Whitney, Martha and any other variety, $1.00, 75c. and 50c. for each variety.

CLASS II.

Sub-Class A.

Best plate of five apples. For competition by growers of only Sunbury, Queens, Kings and Albert Counties.

Northern Spy, King of Tompkins, Bishop Pippin, Golden Russet, Ben Davis, Blenheim Pippin, Gravenstein and R. I. Greening, $1.50, 1.25, and 1.00 for each variety.

Sub-Class B.

For competition only by growers in Carleton, York, Charlotte, Westmorland and Kent counties.

Alexander, Wolfe River, Fameuse, McIntosh Red, Dudley's Winter, Milwaukee, Bishop Pippin and any other variety, $1.50, 1.25 and 1.00 for each variety.

Sub-Class C.

For competition only by growers in Madawaska, Restigouche, Gloucester, Northumberland, Victoria and St. John counties.

Duchess, Wealthy, Alexander, Wolfe River, Dudley's Winter, Fameuse, McIntosh Red and Talman Sweet, $1.50, 1.25 and 1.00 for each variety.

CLASS III.

Collection of Apples, not less than five varieties, exhibited by growers, $3.00, 2.00 and 1.00, for every county in New Brunswick.

CLASS IV.

Apples.

Best 10 varieties grown in New Brunswick, 5 specimens of each, $6.50, 5.00, 4.00, 3.00 and 2.00.

CLASS V.

Sweepstakes.

Best collection of apples grown on any one farm in N. B. Exhibitors in this class must be prepared to make affidavit that all the specimens shown were grown on their own farms, $5.00, 3.00 and 2.00.

CLASS VI.—A.

Export Varieties.

Barrels ready for shipment, $4.00, 3.00, 2.00, and 1.00; Boxes, ready for shipment, $4.00, 3.00, 2.00 and 1.00.

CLASS VI.—B.

Domestic Varieties.

Barrels, ready for shipment, $4.00, 3.00, 2.00 and 1.00; Boxes, ready for shipment, $4.00, 3.00, 2.00 and 1.00.

CLASS VII.

Pears.

Flemish Beauty, Clapp's Favorite, Duchess, Bartlett and any other variety, $1.50, 1.25 and 75c. for each variety.

CLASS VIII.

Bog Cranberries.

Best callection, named varieties, one quart each, $1.25, 1.00 and 75c.

CLASS IX.

Fruits preserved for table use in 1 quart glass jars of each.

Strawberries, Raspberries, Cherries, Currants, Gooseberries, Blueberries, Plums, Blackberries, Pears, Crab Apples, any other Preserve, 1st prize, $1.00; 2nd, 50c. in each case.

Best collection preserved fruits, 8 varieties, no more or less, $2.00, 1.50 and 1.00.

CLASS X.

Fruit Jellies.

In glass jelly jars, one jar of each. Currant, Crab Apple, Apple, Cranberry, Plum and any other variety, $1.00, 75c. and 50c. for each variety.

CLASS XI.

Best collection of Fruit bottled for exhibition purposes.

Strawberries, Raspberries, Blackberries, B. Currants, R. Currants, W. Currants, Cherries, Plums and Crab Apples—Apples and Pears excluded, $10.00, 8.00 and 7.00.

Special advice re bottling and the best solution to be used for the preservation of each kind of fruit will be furnished on application, by the Provincial Horticulturist, in care of the Department of Agriculture, Fredericton, N. B.; and the Department will furnish free of cost to New Brunswick growers, special jars made for this purpose on condition that the jars with their contents become the property of the Department after the award of prizes.

SPECIAL COUNTRY PRIZES

A number of public spirited persons in your county are donating prizes to the extent of from one hundred to one hundred and fifty dollars, competition to be limited to the county, and you are urgently invited to avail yourself of this additional opportunity and to contribute to a large and excellent display from your county. The complete prize list with rules, regulations and entry forms will be sent you as* as soon as the details are completed.

HOW TO GROW EXHIBITION FRUIT.

In a well pruned, well sprayed, well fertilized and cultivated orchard a large percentage of the fruit will be fit for exhibition purposes, but in an unpruned, unfertilized and sod-bound orchard it is indeed hard to find specimens sufficiently large and at the same time free from blemishes which would mar their chances of success on an exhibition table.

Unfortunately most of the orchards belong to the latter class, but by putting into practice the following directions we may obtain exhibition fruit and at the same time prove to ourselves the advantages of modern orchard practice and thus take a step leading to a better all-round care of our orchards.

Where possible plough under the sod after first putting a good dressing of barnyard manure on it and follow directions given in Bulletin II. for renovating old orchards. If the orchard must remain in sod the desirable effect of cultivation may be largely obtained by a heavy mulch of barnyard manure. Now take the thriftiest, best thinned out and most productive tree of the required varieties. If it is a variety that scabs badly spray the whole tree or that half of it exposed to the most sunlight just before the leaf buds burst with Bordeaux mixture as per Bulletin II. Spray again for the codling worm when most of the blossoms have fallen, also as per Bulletin II. When the apples have reached the size of a small crab thin out on the best branches to six inches apart, taking particular care to remove the smaller apples and those with scab spots, worm holes or blemishes of any sort.

If when you decide to get exhibition fruit it is too late to spray or you have nothing to spray with, by selecting a tree with a good set of fruit and thinning out the branches on the sunny side and then removing the blemished and inferior apples, leaving the remaining ones a good distance apart, we admit the sunshine and air and throw all the sap flow into the complete nourishment of a few large apples instead of the incomplete nourishment of many small ones. Thus we are enabled to grow a few large, clean, well colored specimens for exhibition even without spraying, although it must be remembered that spraying will greatly increase our chances of success and the number of clean apples.

By following these directions you will obtain results that will cause you to work your ground, thin out all your trees and spray thoroughly the next year because you will have very striking evidence that it pays better to grow a bushel of large, clean, well colored apples than a barrel of under-sized, green, scabby and wormy fruit.

What the membership fee of one dollar to The New Brunswick Fruit Growers' Association entitles you to.

1. To twelve free entries at the Fruit Exhibition to be held in St. John before the close of navigation on the St. John River, probably in the first week in November. At this show $500.00 in premiums is being awarded by the Provincial Government. Additional special donations from private persons in each county to the extent of $700.00 are being offered making a grand total of $1200.00 in prize money.

2. To extra entries over twelve at the rate of ten cents each.

3. To free admission to the three days series of addresses and demonstrations on various phases of fruit growing by the best experts obtainable, which series will be held in conjunction with the exhibition.

4. To receive regularly all horticultural publications from the Department of Agriculture at Fredicton, N. B., and a copy of the annual report of the Association.

By becoming a member of the New Brunswick Fruit Growers' Association you will be afforded the following opportunities:

1. To meet individually and collectively the best fruit growers in the province, men with whom you have a kindred interest. The opportunity thus afforded of exchanging ideas and experiences should prove of great value to you, as the most successful fruit growers in Canada today attribute their success in a large measure to constant association with their fellow growers.

2. United we stand—divided we fall. As individuals your powers are limited. As members of a large, enthusiastic and energetic Fruit Growers' Association you will be able to command the attention and respect of the government to procure their aid in redressing your grievances, in enacting legislation to safeguard and further your interests, and in developing the fruit growing industry of the province.

3. By co-operating with your fellow fruit growers greater facilities will be afforded you of obtaining all necessary supplies at a minimum cost—better and cheaper nursery stock, spraying appliances and materials may be procured—and increased attention and respect commanded from transportation companies, commission merchants and apple dealers.

Scale of points for judging fruit proposed by the Fruit Growers' Association of Nova Scotia, 1909.

This Score Card will probably be uniformly adopted throughout the Dominion and constitutes the standard upon which the prizes at the St. John November exhibition will be awarded.

EXPLANATION OF TERMS.

Freedom from Blemish.—Any injury by Insects, Fungus, Bruises, Loss of Stem or other cause, lessening the value or appearance of the exhibit, may be called a Blemish.

Color.—Bright, clear well developed color, characteristic of the variety preferred.

Form.—Represents the perfect or normal type of the variety.

Uniformity.—Specimens should be as nearly alike in size, form and color as possible.

Size.—Indicates care and skill in production, and usually, other points being equal, size wins.

Commercial Value. — Standard, known market varieties, as grown in and suited to the district, preferred.

Quality.—To be considered in collections, Seedlings, new varieties on trial, or other sorts in competition.

Nomenclature. — Exhibits must be correctly named according to the nomenclature adopted by the Society, Association or Exhibition at which they are shown.

Arrangement.—Taste and skill in staging so as to attract attention and add to the general appearance of the exhibit.

Let your watchword be "lets exhibit our fruit at the greatest fruit show ever held in New Brunswick, thus show to the world New Brunswick can grow high quality apples, of good keeping quality for local and foreign consumption."

The Raspberry.

The English garden varieties of the raspberry have all originated from "Rubus Idaeus," a native of Europe

rst found on Mount Ida, in Crete, ence the name. The wild red raspberry, "Rubus Strigosus," is common on this continent from Virginia north. The berries are smaller, but the flavor is much finer than the European berry, of which the best is the "Red Antwerp." Cultivation and hybridization have given us many new varieties. The best of the earlier ones introduced was "Brinckle's Orange."

Of all the newer varieties, none has stood the test of time like the "Cuthbert." Introduced in 1876, it has been grown successfully in every place where raspberries can be grown. It has proved itself an abundant bearer of good flavored fruit, large and firm, and for distant shipment it has no equal. A more recent introduction is the "Herbert" a very promising berry, but not sufficiently tried to speak knowingly about.

The fruit of the raspberry is much sought after, and its uses are numerous. It is fragrant, subacid, cooling and agreeable to the taste. The juice is useful in fevers, but its principal use is to make jam.

THE CULTIVATION OF THE RASPBERRY.

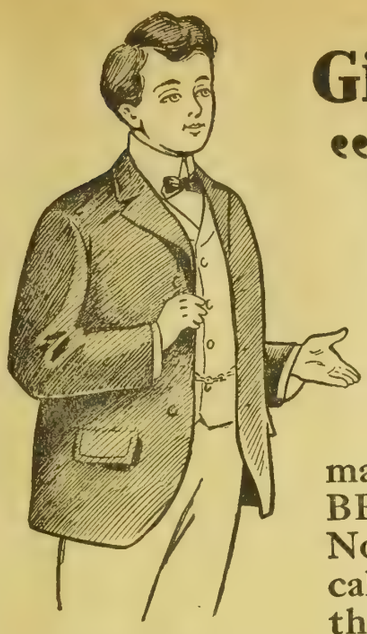
The land should be free from stumps, roots and stones; it should be cultivated as deeply as possible. It will pay to subsoil land to be planted with the raspberry. It is hardly possible to make the ground too rich. The raspberry succeeds best in a loose, loamy, moist soil, but not wet. It should be planted in hills five feet apart each way, three plants to a hill, or in rows six feet apart, and two feet apart in the row. The first plan requires 3,484 plants to the acre, and the second, 3,630. After planting, the ground must be kept clean and free from weeds, and the sucker plants not required for next year's canes must be cut off, thus throwing all the strength into the remaining plants. Never use the plow or cultivate deeply. If you will dig up a raspberry plant you will see the reason for this. The roots are of a twofold nature, the woody roots feeding the plant and going deep into the ground, while the fine fibrous roots which maintain the fruit are always quite near the surface. Plowing or deep cultivation destroys these roots, and thus reduces the crop. Deep mulching has been found to give excellent results. In the fall the old canes should be cut out and burned.

When danger of hard frost is past in the spring, the fruiting canes should be cut back to about four feet. This causes laterals to be put out, increasing the fruit-bearing wood. If the hill system has been adopted, no staking is required, except in localities where high winds prevail. Simply tie the tops together.

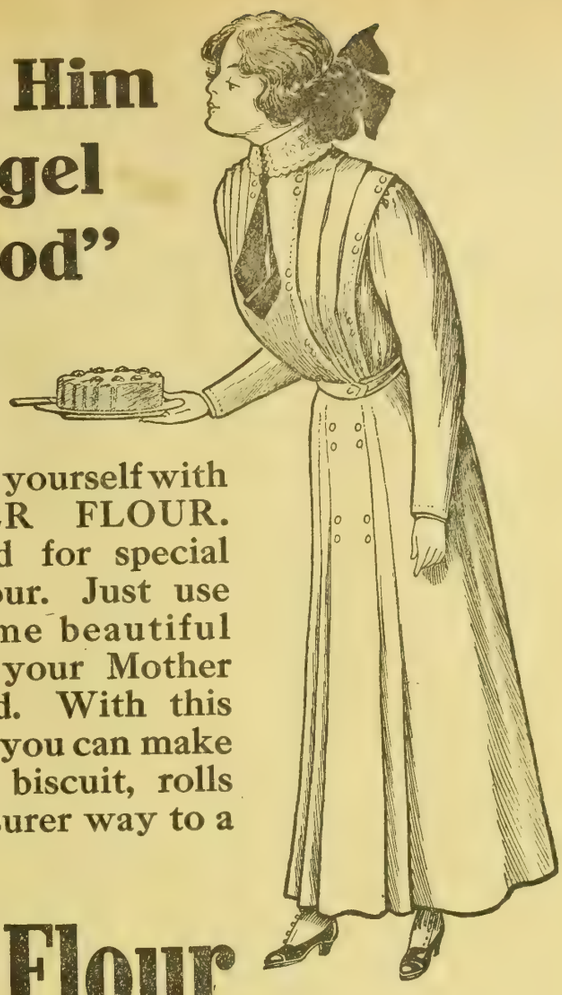
When planted in rows, two wires should be stretched one foot apart, on the same level, with a heavy post at each end, and lighter ones every rod, to which crosspieces are nailed to carry the wires. The vines are trained between the wires and the wires tied together every five feet. The average crop should be 450 crates of 24 pounds. The plants should produce a full crop the third year, and if fertility of soil is maintained, the plantation will be profitable for ten or twelve years, or even longer.

Of all the small fruits, I believe the raspberry to be the most profitable, but it must be planted on suitable soil and receive proper care at the right time.

Prices are renumerative, and will continue to be so. The demand on the prairies and in our cities and towns is increasing much faster than our plantings.—W. J. Brandrith.



Give Him "Angel Food"



made by yourself with BEAVER FLOUR. No need for special cake flour. Just use that same beautiful white flour with which your Mother makes such perfect bread. With this famous BEAVER FLOUR, you can make the most delicious cake, biscuit, rolls and pastry. There is no surer way to a man's heart.

"Beaver" Flour

is made from the finest wheat that can be grown, being a scientific blend of Ontario Fall Wheat and Manitoba Spring Wheat. In this way, we secure a flour that makes not only more wholesome and nutritious cake and pastry, but more delicate and appetizing bread. For both uses, BEAVER FLOUR is unrivalled.

LIVE STOCK.

Scrubs Not All Without Pedigrees

Somehow there seems to be a prevailing idea that scrub animals consist only of those without pedigrees. A lot of our native cattle that have no particular kind of pedigree are much less worthily termed scrubs than might be many of the "well bred" ones that have pedigrees extending well back to the "dawn of creation." Pedigrees and good breeding are most desirable but we want the pedigree to mean more than a tabulation of ancestry on a piece of paper. If the pedigree mean performance, well and good, otherwise not. When we read over the pedigree of a stallion we can tell what his ancestors were and we have an idea of what he may become by the records of his progenitors. The same is true of other classes of live stock. We want the beef cow to raise calves that will take on fat quickly and profitably, the dairy cow should put in her time making milk, we want the bacon hog to produce profitable feeding pigs of the right type and the sheep also to approach perfection in production after its kind. We prefer to have these with a pedigree because their ancestors have been consistently bred along definite lines. But a miserable animal with a pedigree is just as worthy of the appellation of "scrub" as the animal of no particular breeding. "Handsome is as handsome does," and that is the way with pedigrees. The purely bred animal, though, has some merit aside from her individual qualities. She has a "bred in" prepotency which will show itself in her progeny. A poor individual of good ancestory is perhaps better than a poor individaul of no particular breeding. There is no place for either on western farms. A scrub is a scrub whether it has papers or not. Most any day a trip to the stock yards will show a bunch of "retired" bulls that make one feel tired and then re-tired to look at them. They were perhaps scrubs to begin with, but they had papers and were used on the range or farm just as long as they could get a cow in calf. There are a lot of people who cover up their meannesses by a good family name. But they are "scrubs" just the same. And papers and characters of ancestors will not cover up defects in live stock any more than they will in people. Birth and breed cannot be made the test of "scrubbiness." Scrubs may be found in all breeds and the greatest function of the breeders is to get rid of them as quickly as possible. We might say to every critter on the farm: "Act well your part, there all the honor lies."

Bloat in Cattle.

Bloat in cattle is due to an accumulation of gas in the paunch. This gas is produced by the rapid action of gas producing bacteria swallowed on the food. When the quality becomes excessive the organ is distended to such an extent that the left side of the abdomen projects far beyond its natural size. On pressure the presence of the gas is easily detected. The symptoms are quite characteristic of the condition, and so familiar to all who handle cattle that they need not be enumerated here. Treatment is usually satisfactory when begun in time. If the case is severe, no time should be lost in allowing the escape of the gas by means of a trocar and canula. Tap on the left side in the middle of the triangle formed by the last rib, the lateral spines of the backbone, and the point of the hip bone. Direct the point of the instrument towards the shoulder joint of the right leg. The canula may be left in position for several hours, or until no more gas forms. When the canula is removed, evacuate the bowels by giving the cow of average size a drench of one pound of epsom salts and an ounce of ginger dissolved in a quart of water. If the condition is not serious enough to make tapping necessary, give 4-ounce doses of hyposulphite of soda, every half hour until six doses have been given. Good results may sometimes be obtained in mild cases by placing a piece of rope in the animals mouth, like a bit, and tying the ends on top of the head. If the part in the mouth is covered with pine tar, the animal will try to spit it out and in doing so will cause the evacuation of part of the gas through the mouth. Prevent bloat by feeding hay or turning on dry pasture until the cattle are well filled before turning on succulent pasture. Allow the cattle to become accustomed to new pasture gradually. It is not wise to turn them in clover or alfalfa pasture when it is wet with dew, rain or frost. Prevention is better than cure.—Dr. C. C. Lipp.

Dairy Calves After Milk Stage.

When the skim milk diet of the calf is stopped any time from six to 12 months of age, it should be remembered that the calf is deprived of a nitrogenous feed and its place should be taken by some nitrogenous grain or roughage. The tendency of the dairy calf to get too fat depends not only upon its temperament but also upon its feed. Avoid

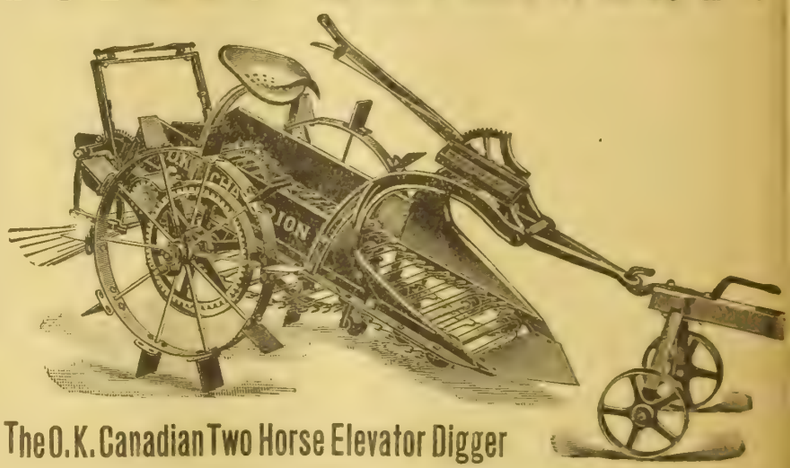
Farmer Agents Wanted

We want a farmer in every locality to act as our representative. No experience necessary. No financial obligations to be met before starting to draw your commission. All notes, etc., are looked after by us.

District representative will call and instruct. Every assistance given in making a sale. The **Empire Cream Separator** is the easiest to clean, easiest to turn and easiest to sell of any separator on the market. A card or letter written us to-day will be attended to at once. After planting and harvesting, you will have a breathing spell—why not make a few dollars? No loss of time from your farm work, no investment, no travel, and no fault finding after machine has been placed. No better proposition has ever been offered you. Write to-day.

The Empire Cream Separator Company of Canada, Limited,
SUSSEX, New Brunswick.

POTATO MACHINERY!



The O. K. Canadian Two Horse Elevator Digger

will dig your crop and do it well. If you are in need of a Digger, you can do no better. than secure one of our machines.

too much corn. For grain, oats and barley are good; for roughage, bright clover or alfalfa hay with corn silage to give succulence and variety. The aim should be to keep the calf in a healthy, thrifty and growing condition. Under proper treatment the calf should continue to grow until four to six years old.

Every effort should be made to develop a large stomach and consequently large capacity; build muscle and good bone, but do not allow it to get too fat. The good dairy cow must handle large amounts of feeds. This she should learn to do while young. For this purpose roughage exercises the digestive apparatus more than concentrates. There are some who think that with a good quality of clover or alfalfa with corn silage or roots for succulence, no grain is neccessary from the time the calf is weaned from skim milk until she drops her first calf. There are others, however, and probably these include the larger number of our progressive dairymen, who think a little grain should be given daily to keep her stomach accustomed to handling grain.

Size depends much upon heredity, but even more upon liberal and judicious feeding. It is impossible to starve good dairy qualities into a growing heifer, but many a promising heifer has been starved into a poor cow.—D. H. OTIS, Madison, Wis.

Demand For Mature Mutton Sheep Lessening.

Yearlings are used to substitute for lambs in the meat trade. The ability to substitute in this way depends upon weight, quality, condition and immaturity, an index for grading sheep in this class is the "breakjoint" which is found immediately above the pastern joint. It disappears when the sheep become mature, and a sheep that does not have it cannot be classed as a yearling. It shows in the live animal as a bony-like prominence just above the pastern joint. The yearling class is composed exculusively of wethers, because the the "break-joint" disappears in ewes at about the time they pass out of the lamb class. Wethers are called yearlings until they are too far advanced to "break" as the dealer calls the "break-joint," which enables the leg to be broken easily because of this structure. The grades of yearlings are:—Prime, choice and good, and are determined in about the same way that the grades for lambs are determined. To grade as primes, yearlings must be highly developed in form, quality and condition and of a light, handy weight, which ranges from 70 to 90 pounds.

Dates to Remember.

The Westmorland Poultry and Pet Stock show, Moncton, N. B., February 9th, 10th and 11th, 1911.

A BETTER INVESTMENT THAN YOUR VERY BEST COW

YOUR best cow is unquestionably a big money-maker. Yet an I H C Cream Harvester will pay you even bigger dividends. That is a startling statement—but true.

And being true—it is a wise move to sell an ordinary cow—and buy an I H C Cream Harvester with the proceeds. It is equivalent to trading an ordinary cow for a champion. For no cow pays as big a profit on the investment as an I H C Cream Harvester—and no cow can pay dividends for so long a time.

You must also remember that a poor separator is a bigger loss than having none at all. For a poor separator means hard work, annoyance, and poor cream. You should be careful to choose a good separator when you buy. The little extra cost should not concern you. A good separator must of necessity cost more than a poor one, because it costs more to make and is worth more.

There are so many cream separators on the market, that you will do well to take no risk. Choose an I H C. Then you will be sure of getting all the profits that a good separator means. You will be sure of getting a machine that skims to a trace—a machine that is famous for its remarkable simplicity—its easy turning, and its easy skimming features. You will be sure to get a machine that is strong and durable—one that will pay big dividends for a lifetime.

There is a wide choice for you in the I H C line. You can get just the size and style that suits you best. The Bluebell is a gear-drive machine—the Dairymaid chain drive. Each style is made in four sizes.

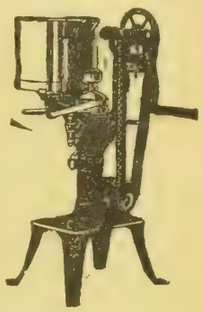
You will find in each I H C many valuable features. You will note that they are

I H C CREAM HARVESTERS

the only cream separators with dustproof and milkproof gearings. You will find in them the most perfect straining device—insuring pure cream and skim-milk always.

You will see that the frame of an I H C is entirely protected from wear by bronze bushings at all points; that the I H C has largest shafts, bushings, and bearings; that it has the safest, simplest, surest, and most economical oiling system; that the flexible top bearing prevents vibration and keeps the bowl steady, no matter how unevenly the power is applied; you will see that the crank is at just the right height for convenient turning, and the bowl is low enough for easiest lifting.

Don't put off this matter of buying a good cream separator. The I H C reputation for fair and square dealing and honest quality machines is a good guide to safe buying. Look for the I H C trade mark. Then you will be sure of getting a separator of proved merit. Visit the I H C local dealer for catalogues and full details. Know the many I H C reasons before you buy any separator. If you prefer, write nearest branch house for full information.



CANADIAN BRANCHES: International Harvester Company of America at Brandon, Calgary, Edmonton, Hamilton, London, Montreal, Ottawa, Regina, Saskatoon, St. John, Winnipeg, Yorkton.

INTERNATIONAL HARVESTER COMPANY OF AMERICA (Incorporated) CHICAGO U S A

WETHERS.

This sub-class is composed of mature castrated males. Most of those offered at Chicago are from the western ranges. The offerings in this class are decreasing every year owing to the growing demand for dressed lamb, which means marketing when young. They are used in places such as hotels, restaurants, etc., where the comparatively heavy cuts can be used to advantage. The grades are:—Prime, choice, good and common. The same conformation, quality and condition are demanded in prime wethers as in prime yearlings. The most desirable weights range from 95 to 110 pounds, though animals weighing up to 140 pounds, if the quality is good, will grade as primes. Prime wethers are bought largely for the export trade. The grading all through is very similar to that for lambs.

EWES.

These are composed of yearling ewes, surplus breeding ewes, and those no longer useful for breeding purposes. There is a wide difference in age, condition and weight. They do not sell on a par with wethers, because they have, proportionately, a greater percentage of offal and a smaller amount of lean meat. Except when there is an urgent demand for mutton, prime wethers sell for at least fifty cents per cwt. more than prime ewes. Ewes are graded as prime, choice, good, medium, common or culls. Those classed as prime belong to the yearling class, and must be of good quality. The strongest demand is for weights not greater than 100 pounds. The other grades conform generally to the standards outlined for previous classes.

BUCKS AND STAGS.

Bucks are males castrated later than the lamb stage of life, and they sell on a par with bucks. Strictly speaking, bucks are not graded, although the terms, choice, good and common are frequently used. Quotations for these do not fluctuate from day to day as do those for the other classes of mutton sheep. As bucks are distributed in with heavy wether carcasses, the more their carcasses resemble those of wethers the more satisfaction will they serve this purpose. The blocky, tidy form, with a light neck and solid, thick firm flesh, sells best.

DEMAND FOR LAMB IN CANADA.

The demand for lamb and other grades of mutton is increasing in Canada. That demand will be still further increased if sheep-raisers give attention to producing lambs and sheep that best meet the needs of the best class of trade. Thin lamb or sheep meat of any kind, does not give the best return, either in percentage of meat to live weight or in that fine flavored juicy carcass so much in demand by the best paying customers.—Illinois Experimental Station Bulletin.

Keep Boar in Good Health.

The boar's condition should always be that of thrift and vigorous health, not too fat, nor yet so lean that as a barrow he would be considered unfit for pork, says Coburn's "Swine in America." If too fat he will be clumsy, slow and in no wise sure. Discretion must be used in the feeding of the boar, for carelessness in this respect may disqualify him for the season or even make him permantly impotent. It is possible to so poorly feed a boar that his progeny will be exactly the kind his owner does not want. His feed should be nourishing and cooling, and if corn is given it should be tempered with feeds which are somewhat laxative, and be used in moderation. When service is severe his exercise may be greatly lessened, and his proper feeding is the means of balancing this inequality.

The Sort of Sow To Breed From.

In considering the efficiency of brood sows, Henry Wallace gives the following advice: Go over those that have had pigs the present year and ask them the following questions: How many pigs did you have this year? Were they all good ones, or did you have two or three choice pigs and were the rest inferior? How did you take care of these pigs? Are you a good suckler? Are you good natured? Are you a good mother, or are you one of the nervous, fidgety kind, always worrying and fretting for fear somebody will hurt you and your preciopus piglets? If the brood sow on being interrogated, cannot give satisfactory answers to these questions it is not worth while to scold her or give her a moral lecture. Just turn her into the fattening pen; for there is where she belongs."—From Coburn's "Swine in America."

When a Sow is In Pig.

Whether or not a sow is safely in pig will be known usually about 20 or 21 days after coupling, so that the probable time of farrowing may be known. The period of gestation is about 112 days from the date or service. Young sows are likely to carry their first litter for a slightly shorter period, not infrequently farrowing in 106 or 108 days while old sows may take a longer time, extending to possibly 115 days. Instances are exceptional when any variation either way exceeds a week from the 112th day.

Weed old rams and wethers out of the flock and send them to the market. They are a nuisance with ewes and small lambs.

Big boys like to torment little ones sometimes. Old sheep of the masculine gender are often the same way with lambs. Better separate them. When they get to bossing the rest of the flock their company is no longer desirable. Get 'em out.

No family having a home in the country is so humble that they cannot keep a sheep. No man of capital has ever invested in sheep and cared for them intelligently but has found them profitable. For quick returns they are next to the cows and the hens, and in proportion to labor involved and profits returned will outstrip them both. Then join with those who are trying to multiply the sheep and abate the dogs.

One Fact Beats 40 Claims

Remember that one proven fact beats forty groundless claims.

It is to be expected that makers and agents of disk filled or other common, complicated cream separators will claim that disks or other contraptions are necessary in a modern machine. They have only complicated machines to sell and want you to believe they are modern. Though forty such makers and agents make that claim, you can't believe it in the face of one proven fact which makes all such claims groundless. And that fact is that

Sharples Dairy Tubular Cream Separators

contain neither disks nor other contraptions, produce twice the skimming force, skim faster and skim twice as clean as common machines. The World's Best. The only modern separator.

Full pan contains disks from common separator discarded for Dairy Tubular. Other pan contains only piece used inside Dairy Tubular bowls.

Sales easily exceed most, if not all, others combined. Probably replace more common separators than any one maker of such machines sells. The manufacture of Tubulars is one of Canada's leading industries.

DAIRYING.

C. W. McDougall, Dairy Inspector, staff Contributor.

Estimating Fat in Butter.

There are two ways in which you can determine the fat in each churning of butter approximately: First, by taking a sample of the finished butter; add it to a large mouthed, glass stoppered bottle, place it in water having a temperature of about 100 degrees until the butter melts, then with the stopper in the bottle shake vigorously until the salt, water, fat, etc., are thoroughly mixed. Continue this shaking while the butter is cooled by placing the bottle in cold water until the liquid becomes of a creamy consistency. It will later solidify but when it has a creamy consistency, a pipette may be filled with this butter and from six to nine grams transferred to a cream test bottle. The amount in the cream test bottle must be accurately weighed; sufficient water is then added to make about 17 c. c. of water and butter in the test bottle and the butter tested in the same way as milk or cream. It is sometimes necessary to use acid of half strngth rather than full strength in making the test. When the fat is separated in the neck of the cream test bottle, this should be placed in a dish of water having a temperature of about 140 degrees and the per cent. of fat accurately read. This result is then multiplied by 18 and divided by the weight of butter placed in the bottle. Such manipulations will give an approximate idea of the per cent of fat in the butter. It is not a very accurate test, however, as the fat is such a large percentage of the butter that errors in sampling and manipulation have a great effect on the accuracy of the results obtained.

A second method for determining the approximate fat in butter is to carefully weigh the cream churned each day, then from the test of this cream the toatal pounds of butterfat in each churning can be calculated. If the butter made is then carefully weighed the per cent. of fat in this butter can be calculated by subtracting one per cent. of fat from the total weight of cream fat and finding what percentage the difference is of the butter made. This one per cent. subtracted represents the loss of fat in butter making by waste during churning.

The per cent of fat in butter can be increased by churning the cream at a low temperature, using a cold wash water and working the butter while it is cold. The percentage of fat may be decreased by opposite conditions, such as using a warm wash water and working the butter in this warm water.

The best way to find out how much fat you have in each churning is to carefully weigh and test the cream to be churned each time, then weigh the butter and find what percentage the fat in the cream is of the butter made.

For Cows on Pasture.

The following question and answer in a recent issue of Hoard's Dairyman is along the same lines as an inquiry in our last issue:

My partner is feeding cottonseed and middlings to the milking cows. They are in good pasture with plenty of feed, but are very thin. As I met with such exceedingly good results from the change I made by your suggestion with my cattle at Arlington, I would like you to give me the kind of feed you think best suitable for milking cows on grass. A. W.

Boston, Mass.

When cows are on pasture we would not, as a rule, feed them any cottonseed meal. Grass is rich in protein and furnishes all that is necessary, when reasonably good, for cows producing an average flow of milk. To cows that are doing exceptionally well, some grain can be fed to advantage. This is especially true if the pasture is short. A mixture of grain that supplements pasture best contains a rather high percentage of carbohydrates. Ground corn or barley are good feeds to give to animals on pasture and they may be lightened by mixing them with some mill feed such as bran. A mixture consisting of one part bran and three parts ground corn by weight makes a very good combination to feed to cows on pasture. It is not possible to state the quantity each animal should receive, for much depends upon its physical condition, amount of milk it is giving and the kind of pasture. Cows thin in flesh will require more grain than those in good milking condition.

If high protein feeds can be purchased as cheap as those rich in carbohydrates there is no serious objection to their use. We would not feed more than one pound of cottonseed meal daily unless it is considerably cheaper than corn, but feeds moderately rich in carbohydrates are best under ordinary conditions for supplementing pastures.

Sources of Errors in Testing Butter by the Babcock Test.

The use of the Babcock test for estimating the per cent. of fat in butter has never been recommended by Dr. Babcock because of the well known difficulties which interfere with getting accurate results. Among the various factors which make these results uncertain are the following :

1. Taking a fair sample of butter.

2. Accurate weighing of the butter into the test bottle.

3. The high per cent of fat in butter which makes errors in reading the length of the fat column due to changes in temperature much greater than in milk.

4. The difficulties in getting the fat free from water when it is measured in the neck of the test bottles.

The effects of these various errors of analyses is five times as great on the fat as it is on the water determination in butter when butter contains 80 per cent. fat and 16 per cent. water, and the effect of these errors is twenty times as great lor butter testing as it is for milk testing when the latter contains 4.0 per cent. fat.

The errors which may occur in weighing the sample of butter for testing is multiplied by the ratio between the weight taken and 100. If an error of one-tenth gram is made in weighing 10 grams of butter, this one-tenth gram is one-tenth per cent of 100, but it is 1 per cent. of 10 grams; and so 80 per cent. of this 1 per cent falls on the butterfat, while only 5 per cent. of it would fall on a milk testing 4 per cent. fat.

The actual effect which an error of 1-10 gram in weighing out the butter will have on the final results may be seen by the following illustration: If instead of 10 grams only 9.9 grams of butter are weighed into a test bottle, after which the test is completed and the reading of the fat in the neck of the test bottle is found to be 45. This reading multiplied by 18 gives 810, which divided by 10 grams of butter gives 81 per cent. fat in the sample tested. If, however, an error of 1-10 gram is made in weighing, and the product of 45x18 or 810 is divided by 9.9 grams, then the result is 81.8 per cent. fat.

The Magnet Cream Separator

is **entirely different** in its **construction** and is **better** than any other cream separator.

It is built

MECHANICALLY CORRECT.

The MAGNET Skimming Perfectly sitting on the rough PRAIRIE
THE SQUARE GEAR AND DOUBLE SUPPORTED BOWL DOES IT STEADY AS A ROCK

MECHANICALLY CORRECT means putting the power on the machine by properly **graded steps** or gears. When you see a very **large wheel** turning a **very small one**, it is a **violation** of **mechanical rules** and means wear, breakage and **trouble**, but is done to **save the cost** of the extra wheels of steps. The **Canadians** who originated the **MAGNET** were **educated mechanics** and could **not** be induced to apply the make shift, worm gear drive, adopted by makers who preferred cheapness in construction to durability. Use has shown that the worm gear drive soon wears, the bowl wobbles and then considerable butter fat goes into the skim milk at each separation. The square gear does **not wear** and the **MAGNET** skims as closely after twelve years use as the first day it skimmed.

Do not take our say so, examine for yourself

Take the **MAGNET** stand, it is **solid, strong** and **rigid**, constructed to **hold the gears without vibration** or **possibility of accident to anyone.**

Square gear drive is used, the only drive approved of for a **fast running** machine like a cream separator.

The shape of the **MAGNET** bowl is **different** from others, being **longer,** enabling the insertion of the famous **one piece skimmer,** so constructed as to take out all the butter fat but a trace, at the same time **draws** out all **dirt and foreign matter** and holds the same to be washed off. This skimmer delivers **pure cream.**

Bronze bearings are used on the **MAGNET,** because being harder than steel they do not wear out.

Glass hard steel balls, extra large size, are used, will not wear or break.

The brake (**MAGNET PATENT**) circles the bowl, stops the machine in eight seconds, does not injure it.

The bowl is supported at both ends and cannot wobble or get out of balance (**MAGNET PATENT.**) All other separator bowls are run on one end, the vibration of which leaves butter fat in the skim milk

Every point in the **MAGNET** is a strong point, no weak spots.

A cent postal card will give you a full demonstration of the **MAGNET** in your own dairy. No obligation to buy.

THE PETRIE MFG. CO., LIMITED,

Vancouver, Calgary, Winnipeg, Hamilton, Montreal, St. John.

HAS USED DR. FOWLER'S EXTRACT OF WILD STRAWBERRY

For Over Seventeen Years

FOR DIARRHŒA, DYSENTERY, SUMMER COMPLAINT, ETC.

Mrs. Holliday, Box No. 86, Wroxeter, Ont., writes:—"I must say that we have used Dr. Fowler's Extract of Wild Strawberry for over seventeen years, and have found nothing to equal it for all Summer Complaints, Diarrhœa, Dysentery, etc. Our house is never without a bottle of the Extract and I can recommend it to be kept in every home, especially where there are children."

You run absolutely no risk when you buy Dr. Fowler's Extract of Wild Strawberry, as it has been a standard remedy on the market for over sixty-five years.

A few doses have often cured when doctors' prescriptions and other remedies have failed. Its effects are marvellous. It acts like a charm. Relief is almost instantaneous.

We wish to warn the public against being imposed on by unscrupulous dealers who substitute the so-called Strawberry Compounds for "Dr. Fowler's."

Ask or "Dr. Fowler's," and insist on getting it, as the cheap imitations may be dangerous to life.

The original is manufactured only by The T. Milburn Co., Limited, Toronto, Ont. Price 35c.

The variation of 1-10 gram in weighing the sample of butter into the test bottle has made an error of 8 per cent. fat in the final result.

If this same error of 1-10 gram is made in weighing 6, instead of 10 grams of butter into a test bottle and the test of the butter is made in cream test bottles reading to 30 or 40 per cent, the effect of this small error is much greater. Suppose the reading of fat from the six grams of butter is 28; this multiplied by 18 gives 504 which divided by 6 (the weight of butter taken) gives 84 as the per cent. of fat in the sample tested. If, however, the reading 28 multiplied by 18 or 504 is divided by 5.9 instead of 6, then the result is 85.4.

This shows a difference of 1.4 per cent. fat between the result obtained when the weight of butter is taken as 6 grams and when it is 5,9 grams.

If this same error of 1-10 gram is made in weighing the butter for a water determination the effect of the error on the final result will be much less as is seen by the following figures: If 10 grams of butter are weighed for a water determination and loss of weight by drying is 1.6 grams, then this loss is 16 per cent of the 10 grams of butter weighed out. If an error of 1-10 gram was made in weighing the butter then the loss, or 1.6 grams divided by 9.9 grams instead of 10 grams of butter gives a percentage of 16.1 per cent water in the sample tested. In this case there is a difference in the final result of only 1.40 per cent when an error of 1-10 gram was made in weighing the butter.

Buttermakers in creameries do not often make weighings closer than 1-10 gram on the scales they use and many of these scales are not sufficiently sensitive to weigh as fine as 1-10 gram. They will, therefore, have difficulty in getting duplicate tests of the same sample of butter to agree much closer than 1.0 per cent fat simply because of the effect of this one source of error which is introduced when weighing the butter for testing.

Another point in testing butter for fat by the Babcock test, that will have a great effect on the final results, is the temperature of the fat column when it is measured. The extent to which the fat column will change with the increase or decrease in temperature is shown by the following figures:

The expansion of fat by a change of 40 degrees in temperature amount to .07 per cent fat in milk testing 5 per cent fat; that is, if a milk testing 5 per cent fat is read at 110 degrees F. the reading will be 5.07 per cent fat when the temperature is raised to 140 degrees F.

This same effect of expansion on the test of butter containing 80 per cent. fat will be 16 times more or .07x16 equals 1.12 per cent fat which will be the difference in the reading of the butter fat test at 110 degrees and 140 degrees F. Or, if the fat test of a sample of butter when read at 110 is 80 per cent fat, the same sample when read at 140 degrees F. will be 81.12 per cent fat.

All the other errors of manipulation in testing butter by the Babcock test, such as determining the point of reading the top and bottom of the fat column, loss of moisture and of the butter when it is being weighed into the test bottles, and other mechanical losses, are at least five times as great for a fat as for a water determination in butter, and 20 times as great for butter as for milk testing 4 per cent fat.

The errors all come on the amount of the substance tested and 80 per cent of this error falls on the fat while only 16 per cent of it falls on the water in butter and 4.0 per cent of the error would fall on the fat in milk testing 4.0 per cent fat.

After understanding the full effect of all the errors of analyses as well as the difficulty of weighing butter into test bottles, the necessity of using extreme care in every manipulation and in keeping the scales and glassware in a most sensitive and accurate condition, one must not expect to use the Babcock test for determining fat in butter with the same degree of accuracy as it is used in milk and cream testing. Duplicate results on the same sample butter may not agree within one per cent of each other and the results obtained may easily be 2 per cent. from the actual fat contained in the sample tests. All these variations and inaccuracies being due to the errors of analyses and the fact that the fat is such a large percentage of the butter.

When fairly satisfactory results are obtained in testing butter by the Babcock test it is probable that the errors of one class have compensated for, or balanced the errors of another class in the opposite direction, but at the same time it is possible that all the errors may be in the same direction and thus increase the inaccuracies of the results.

E. H. FARRINGTON.

Dairy Dept. University of Wisconsin, in Hoard's Dairyman.

Good Care.

A breeder of registered cattle was showing us his herd once when we remarked to him that we never saw his animals in as fine condition before.

"Yes," he said, "and it is mainly owing to my foreman. He is the best caretaker I ever had. My cows never did as well at the pail as they have the past two years since he has had charge of them. The more I study this cow question, the greater importance do I attach to care and feed. Blood is a good thing, the foundation thing, but what is blood and breeding worth if you do not give the cattle plenty of good feed and constant, watchful care?"

There was a whole sermon in those few words; a sermon to hired men and foremen, showing them the line of their best thought, effort and ambition; a sermon to cattle owners showing them what to provide for. This is particularly true with heifer calves until they are bred and safely in calf.—Hoard's Dairyman.

Visitors to the Exhibition

are cordially invited to visit the **splendid New Oxygen Parlors,** recently opened up in **St. John, Suite 20, Robinson Building, opposite Market Square.**

It is a well-known fact that in many homes there are those who are in suffering and pain. Obviously it is of first importance to be relieved of such a condition.

Well, we claim to have the means whereby such relief may be permanently obtained.

It is found by the use of the Oxygenator. A marvellous device that has the power to so open the pores of the body that largely increased quantities of Oxygen are transmitted through the pores to the blood and thereby drives out disease.

We positively claim to cure, by this means, all curable diseases. The machines have been on the market in England, Mexico and the United States during the past 14 years and therefore are not an experiment.

They last for life. No Drugs, no Massage, no Electricity used—Oxygen only and nothing but Oxygen.

Our 72 page book, "Oxypathy," free for the asking.

The wonderful machines may be purchased outright or rented by the month.

Some of the most representative citizens throughout the Maritime Provinces are the proud possessors of our machines.

Lady attendant. Office reached by electric elevator. 'Phone Main 2367.

P. S.—Be sure and see our exhibit on the main floor at the Exhibition, right next to St. John Electric Light Co.'s display.

THE HORSE.

Sore Shoulders.

The care of the shoulders of young horses is one of the most important factors to keep in mind during the first few weeks of the spring work.

A horse can not do satisfactory work with shoulders that pain him every time he takes a step. The horse may be looked upon as a machine that is expected to do so much work, and if some of the mechanism is out of order, then the amount of work is lessened. But, also the animal must be looked upon as a creature with feeling and ambition, taking pride in its work, that is a willing, obedient and, therefore, valuable servant, and should be properly cared for.

The first thing of importance to consider in the draft horse is the collar. Most of the injured shoulders are the result of poorly fitting collars, and the fault usually lies in a collar being two large. It is a good idea to have a harness maker fit the collars to your horses. He may be able to remove padding, and in other ways make the collar over so that it will fit nicely. Heavy collar pads are to be avoided if possible. They are hot and cause the shoulder to sweat; this keeps the pad and shoulder wet, and the skin becomes soft and blisters easily.

Dirty collars are probably as responsible for sore shoulders as ill fitting ones. In the spring the horse's hair is long and holds large quantities of dirt and scales from the skin. He is soft from lack of work and sweats profusely. This forms a gummy dirt that adheres to the collar and makes, when dry, a hard, tough surface. The ordinary farm hand feels that his duty is done if he scrapes the dirt from the collar with the back of his jack knife. This method, however, is not an especially good one for the leather of the collar, and a smooth surface is not left. A damp sponge used in the evening as soon as the collar is taken off will, in one or two minutes, remove the dirt. This may be followed by an oiled rag; if this is done, the collar, in the morning should be soft and smooth.

Careless driving, jerking a horse out of the furrow and into it again, allowing him to work with his head around on one side, all tend to produce sore shoulders.

Of course, the first precaution to take is not to ask the colt to do a full day's work until he learns something about his job and ceases to fret. The shoulder will then gradually become toughened. It is a good idea to sponge the shoulders with cold water—just plain cold water. Alum water has been used to good advantage; also weak solutions of tannic acid. Alcohol tends to toughen the skin.

The injuries to the top of the neck very frequently terminate in fistulas, withers, etc. A blister near the point of the shoulder is likely to become a callous and form what is known as a "cold abcess." Ill fitting collars and poor drivers are equally responsible for a condition known as "sweeny."

It has been the earnest endeavor of this article to show that the farmer is directly responsible for the sore shoulders of young horses; that by observing a few simple things he may avoid loss of time, expense and suffering or perhaps permanent injury to his animals.

If an accident occurs and in spite of careful attention a horse's shoulder becomes injured, do not wait until a fistula has developed, or an abcess has formed, or the animal is "sweened," but seek the advice of a veterinarian while there is still a chance to check the progress of the injury. This is not the proper place to teac the treatment of such conditions after the injury has been done; it takes years of school work to do that, but it is a good opportunity to impress upon the minds of horse owners that such unfortunate things may be entirely avoided.— H. E. Kingman in American Cultivator.

How the Stallion Should Live.

Editor Maritime Farmer:—

There is nothing better than the usual stallion ration of oats and bran. Crushed oats mixed with about one-fourth as much bran by weight makes a good combination. It is bulky, safe, nutritious and agreeable to the stallion's taste, digestion and requirements. A bran mash once or twice a week has for years been deemed desirable for its laxative effect unless the stallion has access to grass, but some leading practitioners condemn the weekly bran mash as conducive to colic. Some owners prefer to depend entirely on cured feed throughout the season, but others equally successful esteem a few minutes grazing daily at the halter or the run of a grass lot as very essential to the health and vigor of their stallions. The freedom of a roomy lot with a high strong fence is a splendid thing, grass or no grass.

The essential thing in the feeding is to furnish the horse abundant nourishment and keep his system in vigorous healthy form. Whatever grass is fed should be grazed by the horse. It is not safe to feed it in the barn, for almost surely some of it will at some time sour in the manger and produce trouble. It is better to graze the horse in the evening rather than in the morning.

Timothy hay is the safest kind to feed, and most of it should be fed long. If the horse bolts his grain, cut some hay short and mix about two quarts of that with each feed of grain. The total amount of grain feed per day should be about one pound for each 100 pounds that the horse weighs, but more should be given if he has a large amount of road work or is a hard keeper. There is a great variation in the requirements of different horses in this respect. Of hay he should have about one pound a day for each 100 pounds that he weighs and little variation need be made from this rule unless he gets considerable grass. Give the grain in three equal feeds and give about half the hay at night and rest divided between morning and noon. If strictly first-class clover or alfalfa hay is available a little of it may be fed with evident benefit. A little oilmeal, not over one pound a day, is fed by some successful stallioners with good results.

It is doubtful if sufficient benefit follows the use of eggs to make it worth while to use them in most cases. If the horse appears to be poorly nourished and has a very large patronage there may be something gained by feeding them. Men who feed eggs generally give two to four eggs beaten up in as many quarts of milk. To this may be added a double handful of oilmeal, first scalded, and the whole fed warm after supper.

Kings Co., P. E. I. GROOM.

Treatment of Corns.

Whenever possible, remove the cause of the corn. The sole should be examined thoroughly to determine the extent and nature of the corn.

If a suppurating corn is present all the sole under-run with pus should be removed. Then apply a pack of 1-1000 bichloride and keep moist with this solution for 3 or 4 days. Then pack the corn with white lotion for three days. The horse should then be shod with a bar shoe and all pressure taken off the wall in the region of the corn.

FARMERS OF THE EAST

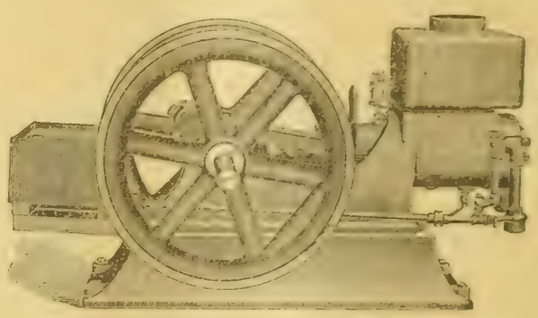
should take out an agency for the easiest selling Gasoline Engine on the market to-day. We refer to the

"WATERLOO BOY"

FROST PROOF STATIONARY ENGINE

The most complete and up-to-date Gasoline Engine on the market to-day.

Write at once for full particulars. We will give you every assistance in making a sale. Don't delay, the territory you want might be taken if you wait until to-morrow.



I am a "Waterloo Boy" but can do the work of several horses.

POULTRY.

Coal Tar Smudge.

A dangerous disease of poultry is canker, or fowl diphtheria, or swollen eyes as it is commonly called. It is known by the presence of yellow, cheesy matter in the throat and windpipe, and is usually caused by the fowls sleeping in close, damp, unsanitary quarters. Since the introduction of fresh air poultry houses, this disease has materially reduced and its attacks have been less severe.

One of the best cures for canker is fumigation with coal tar. This is done in the following way: After the fowls have gone to roost in a tightly inclosed room, take an old can and place in it one quart of coal tar for every 100 birds. Bring the tar to a boiling state by plunging into it a piece of hot iron. Close the door and make the house as near air tight as possible.

A thick smudge results, in which the fowls should be allowed to remain until the following morning. By listening at the door one can distinctly hear the inmates coughing but no fear of their suffocating need be entertained. (When this treatment is used on valuable birds, we would not start it at night. You might just as well confine in the house the fowls you desire to fumigate, and heat the coal tar after breakfast. You can then examine the birds every hour during the day, and do away with the danger of their being suffocated by an overdose of the fumes. Personally, we could not rest contented if we started the treatment at night, and were worried over how the birds were going to stand it. Ed.)

Fowl diphtheria is primarily a disease of the throat, and the swollen eye is a secondary result. In its distress caused by difficulty in breathing, the fowl tosses its head from side to side. This results in mouth being thrown into the eye, causing inflammation and suppura- the diphtheretic discharge from the tion of that organ.

It might be mentioned that fowl diphtheria is not communicable to the human being, being totally distinct from the disease of the same name affecting man. Fowl diphtheria and human diphtheria are caused by entirely different germs.

The prevention of this disease is much easier than the cure, and fresh air is one of the greatest safeguards against attacks of diphtheria. In treating this disease in children the physician always opens the windows of the sleeping room to the sash and keeps the air of the room pure, no matter how cold it is. If you are threatened with an outbreak of diphtheria or roup among your birds you will find fumigating the birds and house with coal tar will check the disease and kill the germs. Afterwards, open the windows and depend on fresh air day and night, and healthful and strengthening food to bring the fowls into good health.—August Schwarz, in The Standard.

Lice Always a Menace to Chicks.

Eternal vigilance is the watchword for June, says a writer. Constant care and attention to details is the price of success. Several days ago a lady neighbor asked me to come and see her chicks and tell her what was the matter with tnem. I said "lice." She said "No." Continuing she said: "I never could raise May-hatched chicks. They just stand and sleep their lives away." I went to the poultry yard and found three broods of chicks about a week old. I picked up a "sleepy" chick, parted the down on its neck, head and under the lower beak, took my little pocket magnifying glass and looked into the down, and found it a living mass of the large grey head lice. These lice move out very little. They are really ticks. They burrow into the skin, stand on end, head down with their slender body close by the side of the small quill of the downy feathers. There were hundreds of them on that chick and on every one of them. I handed the glass and chick to the lady and told her to look. She looked closely, then said: "Those are not lice, but are the new feathers coming out." I then took the chick, picked off a bunch of these pin-feathers, laid them on the glass, and soon it was living, crawling mass. Then she exclaimed: "Good Lord! I don't wonder they get sleepy."

ffi

This is the reason why so many people have a superstituous notion that May chicks will not live. Where chicks are hatched under hens they must be examined almost daily, and the hen dusted with good insect powder at least once every week until the chicks are four weeks old. If the lice are on the chicks they must be dusted every three or four days for two or three weeks. How do we do this? Do not undertake to dust every individual chick. Take an empty five-pound lard pail with a close-fitting cover; put a small handful of insect powder into the pail, put in eight or ten chicks, put the cover on tight, and invert the pail quickly two or three times; remove the cover, take the chicks out and put in another lot and repeat until all are dusted. This does it quickly and thoroughly and does not waste the powder. I can dust 100 this way in ten minutes. Dust the hens and repeat in four days.

Rules and Regulations for Co-Operative egg Circles.

1. That our organization be called the.....branch of the Poultry Producers' Association of Canada.

2. That our officers consist of a chairman or president, a secretary-treasurer, and a board of three directors.

3. That the duties of the officers be as follows:

(a) To appoint or elect two of its officers to a plcce on the central board.

(b) To attend to any business that may arise in connection with the working of the system, and improve it if possible.

(C) To keep an outlook over the conditions generally.

4. The membership of the association shall be $1 per annum. To be held, used and disposed of as the directors see fit from time to time.

5. That the circles as now organized have one general superintendent to be appointed by the buyers, and his decision in regard to the quality of the eggs delivered shall be considered final.

6. That anyone may become a member (upon payment of fees), who is interested in the production of better product and will agree to conform, to the best of his ability, with the rules and regulations as set forth, or as may be set forth by the executive from time to time.

7. Rules and regulations pertaining to eggs:

(a) Only eggs gathered from regular nests may be delivered.

(b) Eggs must be delivered at least twice a week, except in winter months, when they must be delivered at least once a week.

(c) Eggs from 'found' nests must not be delivered.

(d) Real small eggs or over-sized eggs may not be delivered.

(e) Rough shelled or ill-shaped eggs may not be delivered.

(f) Stale eggs may not be delivered.

(g) That all male birds be killed or removed from the flock as soon as the hatching season is over, June 1.

(h) That all eggs produced by said flock shall be sold through the circle. This applies for one year only.

(i) That members may deliver eggs from only his own or her own flock.

(j) Notwithstanding anything heretofore set forth patrons may keep for their own use any eggs required, and must not sell any eggs through the circle that does not comply with these rules and regulations.

(k) Eggs as gathered must be kept at an even temperature as near to 60 degrees as possible, and be kept free from draft and dampness.

(l) That any bad eggs in any way delivered and paid for will be counted for if possible and the loss made good to the buyer.

(m) Only artificial eggs shall be used as nest eggs.

8. That we as members will do all in our power to make this a success from a producer's standpoint.

Notes.

Watch for birds' nests in your orchard before you remove a dead tree. If you can save a nest of young birds spare the tree awhile.

Birds destroy thousands of noxious weed seeds every year. They do much good in keeping down insect pests and noxious weeds. Protect birds.

This is the season that young turkeys render such valuable assistance in destroying insects. Those who do not have a flock of poults are unfortunate.

How many hens do you have in your flock that do not pay their board? This may be the reason you do not find poultry profitable. Eliminate the unprofitable hens.

Little chicks will require plenty of fresh water in their reach this hot weather. If this is neglected you will be disappointed in the growth and health of your chicks.

It is poor economy to keep old hens or old roosters. Hens are at their best at three years old, and when kept longer, are apt to give poor returns. Roosters should never be kept longer than two or three years.

Do not forget that a balanced ration is just as essential for poultry as it is for other livestock. A few crumbs from the table or an occasional feed of corn will never produce profitable fowls. It pays to feed a balanced ration.

"Foah Wonderful Labor Savers." —*Aunt Salina.*

¶ The Velox and New Century Washers, the Warranty Wringer and the Monitor Rotary Lawn Clothes Dryer are real labor savers. In thousands of Canadian homes they have transformed clothes washing into an ordinary, pleasant household occupation.

¶ With them there is no cross and tired wife, no trouble keeping servants, no fuss and flurry about wash day.

¶ Try them. At all best dealers. Write us direct if your's cannot show them.

THE FARM HOME

This Department is now being edited by a very competent lady, who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

The Old Brook Farm.

(Continued from last issue.)

The matter was sharply contested in law. Public sympathy was of course entirely with the Taylors, but that did not help the decision being rendered against them. The excitement and suffering which he had undergone threw farmer Taylor into a fever, from which he never recovered. Reuben was at that time only sixteen years of age, a bright, intelligent, industrious boy. His mother was a shrinking, fragile woman; and Amy, his sister, was not yet in her tenth year. The family were oblig ed to leave the homestead, which almost broke Mrs. Taylor's heart. She held in her own right a few acres of wood and pasture land; and this, with the help of Reuben, was all the doubly stricken family had to depend upon for their subsistence. But the boy was brave and energetic, and there were many disposed, for his father's sake, to employ him. And as he grew older the pasture lands were converted into thriving wheat fields; and Reuben commenced farming on a small scale for himself.

But it was hard, slow work, though the sweet face of Charity Ames, now blossomed into early womanhood, extending afar off on the mountains of his future, seemed to lend new strength to his energies—new courage to his heart. But Reuben kept his secret as a girl would hers; and only occasionally waited on Charity home from meeting or singing-schools. He never by a word or look signified to the girl of his love what lay so deep and tender in his heart, but Charity was a woman, and guessed it.

"Oh, I am so glad, Reuben! You must go right off with me."

"Go where, Pussy?" And he caught the child in his arms as she sprang towards him. She was a pretty creature, Amy Taylor, just in her twelfth summer, with brown hair, with a flicker of gold in it, and eyes like Reuben's, and cheeks and lips like clover-blossoms.

"Oh, just over to the store! Mr. Mathews said he should get back from town before sundown, and he'd bring the new calico dress mother's got for me."

"Wait until after tea. I've been pullin' stumps all day."

"Oh, I can't, Reuben!" shaking her head around, so that the touch of gold struck out vividly; "besides it will be too late to see the dress to-night, for Mr. Mathews shuts up at dark."

"I'm afraid, daughter, that supper'll grow cold afore you can go there and back," interposed the voice of Mrs. Taylor, as she broke several freshly laid eggs into the spider.

"No it won't, mother; Dobbin can go fast, and get back in half an hour."

Amy ran up to her mother, and wound her arms about her neck in a way that was irresistible. It was quite evident she was a spoiled child.

"Get your bonnet in a hurry, then!" exclaimed Reuben, as he took down his coat from the peg on which it was hanging. "I reckon you wouldn't feel quite so set on a ride if you'd been pullin' stumps and buildin' stone fence to-day."

"Don't go with her, Reuben," said Mrs. Taylor, in an undertone. She was a little, pale-faced, sorrowful-voiced woman.

"Well. I sha'n't have a moment's peace until bedtime," rejoined the indulgent brother. And the next moment Amy was at his side.

"I'm all ready, Reuben."

The young man pinched her dimpled chin, pronounced her the torment of his life, and they set out together.

They had gone about a mile in the rumbling old vehicle, which had to perform the three-fold duty of carriage, wagon, and cart, when a horse suddenly rushed wildly past them. Every muscle of the noble animal was instinct with terror; his nostrils were dilated; and, with his long brown mane caught and tangled in the wind as he swept by, he presented that half-thrilling, half-appalling spectacle which a thoroughly frightened horse always does.

"O my, Reuben!" exclaimed Amy, drawing in a long breath. "Wasn't that kinder grand, though?"

Reuben shook his head. "I'm afraid he's done some mischief. He's broken away from a carriage; and them shafts must bruise his legs afore long, so he'll come to his senses."

About half a mile further down the road, they came upon a carriage overturned and and broken, near a large pile of stones, over which the frightened animal had evidently attempted to leap, and shattered the vehicle. And close by this lay a man with his face to the earth, and the life apparently struck out of him.

"Is he dead? Oh, is he dead?" Amy whispered the question with white lips.

"I don't know, little sister." Reuben was quietly dismounting. He had those strong steady nerves which are so invaluable in case of any sudden catastrophe.

The young farmer went up to the prostrate man and lifted his head. Amy saw his face suddenly grow white as the dead, and his hands shake as leaves do when sudden gales ride through the trees.

"God in Heaven, have mercy upon us!" ejaculated Reuben Taylor. And he did not say these words lightly, but humbly and reverently, as a Christian should; for in the face of that prostrate man he had recognized him who had laid his father's head, in the prime of his years, under the grass—the man who had broken his mother's heart, and driven the widow and the orphans from their home, and filled his own youth with toil, and patient longing and waiting.

"Who is it, Reuben?" cried Amy. "It's Abel Ross!"

A little cry went out of Amy's lips, for that name had been a source of terror and grief to her ever since her earliest remembrance.

And looking on the prostrate man, there came, for the moment, over the soul of Reuben Taylor a feeling of intense, unutterable loathing mingled with something of triumph that his old enemy at last lay at his feet. And then through the feeling crept the solemn words of the prayer which his mother taught him before he could remember, "Forgive us our trespasses as we forgive those who trespass against us."

"Amy, there is a tin pail in the cart; run to the spring, quick, and fill it with water." And the farmer lifted the unconscious man's head and laid it on his knee, and stroked away the iron-gray locks from his face tenderly as his own mother could have done it.

Amy was frightened into unquestioning obedience. Her brother bathed the white rugged features, and she stood still looking on with long shivering sighs—all the brightness and vividness gone out of her face in its stark terror.

At last a long convulsive shiver went over the man; he opened his eyes and stared wildly a moment at Reuben; he attempted to rise, but his right arm fell down helpless—it was broken. He groaned out sharply, and shut his eyes. In a moment he had fallen back into unconsciousness.

"What shall we do with him? O dear!" cried Amy, wringing her hands.

Reuben meditated a moment. They were on a lonely, little frequented road; there was not a house in sight.

"We will carry him home," said the young farmer, decidedly.

"Oh, Reuben, what will mother say?" ejaculated Amy, for she could not get over her old, childish associations with the name of Abel Ross, or her terror lest some evil should befall them when brought in contact with its owner.

"Mother will say I did jest right," answered Reuben, simply. And he lifted the wounded man into the cart, and held his head on his knee, and chafed his temples with cold water; while Amy took the reins into her shaking hands, and drove slowly towards home. Once during that slow drive the man opened his eyes with a convulsive start.

"Are you in much pain, sir?" asked the farmer.

"Yes, in my shoulder"—and he writhed and groaned fearfully; and then suddenly fastened his eyes on Reuben. "What is your name?" he muttered.

"Reuben Taylor." The young man had the name and face of his father.

There was another loud groan, and a movement as though the sufferer would have writhed himself away; but he fainted again.

At last they drew up before the little yellow story and a half house.

"Amy," said her brother, "go in and tell mother who is here; but you're a sensible little girl when you've a mind to be; tell her in a quiet sort of way."

Amy understood, and executed her work very well, considering her own agitation. In a moment, Mrs. Taylor presented herself at the door, with a face which seemed fairly death-struck, it was so white and strained.

"O Reuben!" she gasped.

He answered her, with a look—"I must bring him right into the house, mother, and lay him on your bed. Then I must run for a doctor, for I fear the life's nearly gone out of him."

They carried the sufferer into Mrs. Taylor's little bedroom. The window was curtained all summer with a trumpet vine through which the sunshine filtered down on the striped carpet, or wound its golden threads among the thick shadows. So they laid the sick man under the low roof to which he had driven the widow and the orphans; and then Reuben started off for a physician, and dispatched a messenger to inform Farmer Ross's family of what had transpired.

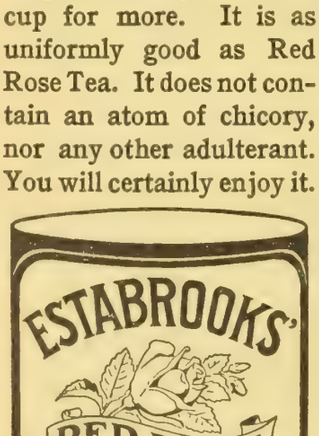
He had three sons, but the oldest was not twenty, and their mother had died several years before. They all hurried over with the "hired men," in great alarm, when they heard the tidings; the physician, however, preceeded them, and he pronounced Farmer Ross to be in a most critical situation, and that he would not answer for his life if he was removed to his home, that being distant six miles.

It was evident that he had sustained serious internal injuries, for the large, stalwart frame would quiver every time it was moved, and great beads of perspiration gathered on the rugged brow. The broken arm, too, was much inflamed, and required constant care. Mrs. Taylor had that most invaluable gift in woman— "skilful hands;" and, though one of the "hired women" from the "Ross Farm" was sent over to take charge of the invalid, her ignorance and awkwardness gave him so much pain that she was glad to relinquish her task to the gentle, soothing fingers of Mrs. Taylor.

It was two weeks before the physician gave his consent to the removal of Farmer Ross. What passed through his mind during this time was never known. He was naturally a reticent man, and then he was brought so near to the grave that he could almost feel the cool waving of the banner of the King of Death over his temples. Much of the time he lay in a heavy stupor, but there were moments when the dark eyes under those shaggy eyebrows would follow Mrs. Taylor with a look of conscious intelligence round the room, and it seemed to her there was something more in them—something of regret and pain. Several times, too, he muttered the name of "Reuben Taylor," in his drowsiness, uneasily, and he would groan out when Reuben entered the room, and close his eyes.

At last, however, he seemed eagerly desirous to return home, and the physician gave his consent, though the recovery of his patient was still doubtful. He conversed but little except on the subject of returning home; but on the morning that he was to be removed he summoned his hostess to his bedside, and said to her: "Mrs. Taylor, I know all that you and your son have done for me; and, whether I live or die, I shall

Estabrooks' Coffee is full of snap and fine flavor. It gives genuine satisfaction to the last drop, and brings back the cup for more. It is as uniformly good as Red Rose Tea. It does not contain an atom of chicory, nor any other adulterant. You will certainly enjoy it.



Sold only in 1 and ½ lb. tins.

Try it for breakfast to-morrow

73

not forget it." That was all he said; all the thanks they received, saving from the farmer's eldest son.

A month had gone by. It was just in the opening of July; one of those vivid, affluent, tropical days that hang like rubies in the thread of the year. Reuben Taylor came in at noon from cutting hay, wiping the thick perspiration from his bronzed forehead.

"Who do you think has sent for you to come right over there, after dinner?" asked Mrs. Taylor.

"I can't tell, I'm sure"—throwing himself down on a chair by the window. "It's too hot to go anywhere afore night."

"Abel Ross has sent for you Reuben. The hired man says he's able to set up two or three hours every day, and the doctor says he's out of danger, though he'll never be the man he was afore his fall."

"I'd calculated on getting through with the south field this afternoon," said Reuben, irresolutely.

"Hadn't you better let it lie over, my dear boy?" timidly interposed Mrs. Taylor, as she placed a platter of young corn on the dinner-table.

The young man pondered awhile, and at last audibly concluded—"Well, I reckon I may as well risk it."

Farmer Ross sat by the window of his great white farm house, so that the sluggish wind from the sea, which cooled a little the hot heat of the afternoon, could wave to and fro through his iron gray locks. The strong, muscular frame had fallen away greatly, and the sunken cheeks and the deep rings around the eyes told their own story of long, slow, physicial suffering.

The farmer nodded to Reuben as he entered, and motioned him to a chair; he had always been a man of deeds rather than words, and those hard, selfish, grinding, cruel deeds to many who were in his power.

"Reuben Taylor," said Farmer Ross, looking with his deep-set eyes full in the young man's face, "do you know that you saved my life, the other day?"

"I think I did, sir," answered Reuben, in his straightforward, outspoken way.

"And do you know that I probably laid your father in his grave?" And this time a smart color crept slowly into the ghastly cheeks of the old man.

"I believe you did, sir." No wonder that Reuben's voice faltered a little now, as the memory of his father flashed over him.

Farmer Ross winced under the words a moment, as though they pained him; and there was no sound in the room save the little rill of melody which the summer wind made as it came in through the windows. At last Farmer Ross spoke again, taking a folded sheet of paper from the table beside him.

"Well, Reuben Taylor, I've thought this all over in my sickness; and it's laid very heavy on my conscience o' nights to think that I'd been the means o' killing the father, and the son had saved my life. So I resolved to make you and yours all the reparation in my power; and there's the deed to the old "Brook Farm," without flaw or mortgage."

"Sir—sir!" muttered Reuben, rubbing his hands across his eyes, and staring at the old man, for he thought he must be dreaming.

"There it is safe and sound, and nobody'll be smart enough to get it from ye, or yer heirs, this time I reckon!"

Then the truth dazzled and broke into Reuben's heart. He thought of his old child-home with its low, pleasant, dear old rooms, of the great garden at the back, with its plum-trees and currant-bushes; he

(Continued on page 716.)

Here is our New Fall & Winter Catalogue

We Pay Delivery Charges to any Destination in Canada

Free Delivery of Goods Throughout the Dominion

The aim of this store has been to reach a point in its development where it can serve on equal terms all the citizens of this great Dominion, and offer to every resident of Canada the advantage of Simpson Quality, Simpson Variety and Simpson Economy, right at your own door without extra cost and without trouble or risk.

The enormous increase of our Mail Order Business now enables us to respond to your good will by being the first store in Canada to extend FREE DELIVERY TO ALL CUSTOMERS.

You need no longer figure out postage, express or freight rates, because the prices quoted in our catalogue are what the goods will cost you at your nearest station, except heavy or bulky goods, as stated in the catalogue.

OUR PART

The Simpson Store—the best constructed and best equipped mercantile building in the Dominion—is now practically your nearest store.

Its immense stocks bought direct from the manufacturers for cash mean economy to you.

The worthy, honest goods, made for service, and the prompt response to your request for return or exchange, mean comfort and satisfaction to you.

The latest, most stylish and up-to-date merchandise in every department means pleasure to you.

YOUR PART

If your name is not already on our mailing list send post-card at once for catalogue.

Our new free delivery system makes it profitable for you to order your entire needs from this store.

You can order any single article at any price, large or small, and we will send it cheerfully and promptly; but we suggest that you try to make each order as large as possible.

Follow carefully the instructions printed in the Catalogue.

N. B.—To get our New Fall and Winter Catalogue promptly send Post Card addressed to Dept. No. 8

Child Training.

H. Clay Trumbell was once asked by a friend to give his theory of child-training. His reply was "Theory? I have no theory in the matter. I had lots of theories before I had any children, but now I do with fear and trembling in every case just that which seems to be the best for the hour, whether it agrees with any of my old theories or not," and I believe most parents feel the need of something more practical in the realm of child-training than untested theories.

Training a child is a possibility long before teaching that child is. The tiny infant can be trained to go to sleep in the arms of its mother, in a cradle, or in a bed, without rocking or with rocking, in a light room or in a dark one. A very young child can be trained to cry for what it wants, or to keep quiet as a means of securing it. Thus a child six weeks old may be well started in its life-training, although its teaching is not attempted for months later. Teaching fills the mind, training shapes the habits, and the parent who does not recognize the possibility of training his children as well as instructiug them, misses one of the highest privileges as a parent, and fails of his most important work for his children.

NO CHILDREN PERFECT.

Every child, is in a sense, partially developed, an imperfectly-formed child. There are no absolutely perfect children in this world, all of them need restraining in some things, and stimulating in others, therefore, we must study, our children to find out their peculiar faults, and be very wise and careful in our treatment of those faults.

Perhaps the wise guiding of the child will should be counted among the foremost duties of one who is responsible for a child's training. Will breaking has no part in the right training of the child. To break a child's will is to destroy the child's privilege of free choice. A father says to his strong-willed boy: "Johnny shut the door." Johnny says: "I won't," and a conflict of wills results, brute force compelling the boy to do what he chooses not to do. What then should be done? Let the father say: "Johnny, you may have your choice in the matter. You can either shut the door or take a whipping." Now the boy has a choice to make. A parent should never say: "I will whip you until you do," and no child ought ever to be punished unless he understood, when he chose to do the wrong, that he was thereby incurring the penalty of punishment.

JUDICIOUS DENIAL.

A child ought to be denied by his parents many things which in themselves are harmless. It is an injury to a child to always have food he prefer, every plaything his parents can afford him. If he has never a desire ungratified he is poorly prepared for the duties and trials of everyday life. The average child of the present generation has more indulgences from his parents in any one year of his life than the average child of a generation ago received in all the years of his life. The child of to-day expects new things as a matter of course. He asks for them in the belief that he will receive them. A boy of nowadays can hardly prize his new bicycle, after all the other presents he has received, as well as his father, prized a little wagon made of a raisin box. A little girl cannot have as much

Feel Young Forever.

Let Me Put Vitality Into Your Blood, Nerves and Body. Follow Me to Health and Manhood. I Can Show You What Others Have Done to Change Debility, Weakness and Despondency Into Health, Strength, Vigor.

Vitality is the measure of the man in this day of big deeds and monster achievement. He who has great vital strength cannot grow old. Years count for nothing if you have the vitality in your blood and nerves. My Health Belt with suspensory attachment is the FOUNTAIN OF PERPETUAL YOUTH. It pours quantities of electro-vital force into your weakened system. It works quietly, mildly, continually hour after hour while you are sleeping. It is your opportunity as it has been the opportunity of tens of thousands before you; it supplies you with that vitality upon which health and courage depend. It is a power and strength giver of the highest order. No drugs, nothing to take internally, no dieting, no hardships of any kind. Simply use the Health Belt nights until you are restored to vigor. It never ceases until you have as much courage and self-reliance as the biggest, fullest blooded man you know. Your eyes will have the sparkle of full health, you will have the vigor of a strong, healthy man. Henry Eggman, Norwich, Ont., writes: "Thanks to the use of your Health Belt I am young again. It restored me after all else failed. Use my testimonial as you see fit." This is but one of thousands. Get the free books and read of others.

Special rheumatism attachments to my Health Belt carry the Electro-Vitality to any part of the body, the neck, back, arms, legs, feet. It finds and drives away all pains and aches; it has often completely cured weak back in one night so that it never returned again. It is a wonder remedy for chronic ailments of the nerves, blood and muscles.

FREE UNTIL CURED.

Call or write to me and I will at once arrange to let you have the Belt on trial, not to be paid for until cured. No deposit or advance payment. Send it back if it doesn't do the work. Liberal discount for cash if you prefer to deal that way.

These Books Sent Free

Let me send you these Books. They contain much valuable Health information, are fully illustrated, describe my Health Belt. Fill in coupon or send your name and address on a postal card, or if possible call at office and see Belt. Office hours : 9 to 6; Saturdays until 9 p. m.

enjoyment out of her third new wax doll, that opens and shuts its eyes, as her mother did out of her only doll, stuffed with rags, or made of painted wood. We should deny our children many things if we wish to train them to self-denial and endurance.

DON'T NAG A CHILD.

Then in training our children there must be always a large measure of letting alone. Nagging a child is not training a child. Don't be always don'ting, and avoid an issue on any question of discipline whenever it is safe to do so.

We must train our little ones to control their nerves, or they will be hopelessly controlled by their nerves. Perhaps a child has fallen, or cut his finger or has burned his hand, it is natural for him to shriek with pain and fright, but the mother's duty here is to help her child to control himself, and be calm. Coaxing and rewarding the child into quiet is not what is needed. A good illustration of the unwise way of inducing children to seem to have control of themselves is given in a familiar story of the little fellow throwing himself on the floor, and kicking and yelling, and then crying out: "Grandma, grandma, I want to be pacified, where are the sugar plums?" It must be a very dull child, indeed, that will not cry and fret a great deal when it is so pleasantly rewarded.

Scolding is never in order. If a child has done wrong, a child needs talking to; but no parent ought to talk to a child while that parent is unable to talk in a natural tone of voice, and with carefully measured words. The parent's first duty is to gain entire self-control.

But the vital question in connection with every home is, Is the atmosphere of this home, suited to the life and growth, to the development of the child's best nature? That atmosphere must be full of the pure oxygen of love to God and love to man—all this it may be, all this it ought to be.—MRS. T. E. CHISNALL.

Teach Obedience and Self-control.

After close observation of my own boys and others' sons, it seems to me that obedience and self-control are two requisites all important for the growth and happiness of our children. By obedience I do not mean nagging a child until he minds the parent, or threatened punishment the impetus for the child to do as he is bid, but to train him to a prompt cheerful swiftness of the service required. Self-control does not mean self-repression, lest all the lovable, spontaneous qualities that are a child's by right would be taken away. It means a certain temperance in living even when young, to scorn a mean act, to control the temper, to share with others.

When a baby is old enough to understand "yes" and "no," it is ready for its first lesson in obedience.

When in a temper a little friend of mine is allowed to destroy his personal belongings. What right has his parents to expect him to respect the property of others later in life?

It is along these lines of odedience and self-control that the George Junior Republic has won for boys a place unique and strong, which shall fit them for years of acceptable service in our larger Republic.

Although we mothers must hesitate when we speak collectively of children, knowing that each child has an individuality of its own, and that the character-building must be suited to the need of the child, yet, we believe there are certain essentials, like obedience and self-control, which are necessary for the development and happiness of all children.

But however we may strive to achieve the "best things" for others, or to discern what is most important for good citizenship, we shall all fail signally if by our own example we do not "study to show ourselves approved" and by our own life prove the worth of those qualities we so desire for our boys.—G. H., New York.

ALMOST DISABLED

Father Morriscy's No. 7 Cured His Rheumatism in 3 Weeks.

Father Morriscy's prescription, called "No. 7", cures Rheumatism completely as well as quickly, as Mr. James Major, of Hartland, N.B., gladly testifies.

"I want to tell you", he writes, "of the wonderful cure Father Morriscy's medicine made of me. I was troubled with Rheumatism so badly that I could not get into my wagon alone. After using his medicine for three weeks I was completely cured, and felt like a boy.

"I am now a man of 79 years of age, and in good health yet—to Father Morriscy's medicine I owe all thanks.

"I can truly advise anyone suffering from Rheumatism to use this medicine at once."

Father Morriscy's No. 7 Tablets act directly on the kidneys, invigorating them so that they can thoroughly cleanse the blood of the Uric Acid which causes the Rheumatism, and thus permanently cure.

Ottawa, 22nd August, 1910.

BETTER THAN SPANKING.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

Chamberlain's Colic, Cholera and Diarrhoea Remedy is today the best known medicine in use for the relief and cure of bowel complaints. It cures griping, diarrhoea, dysentery und should be taken at the first unnatural looseness of the bowels. It is equally valuable for children and adults. It always cures. Sold by all dealers.

The Old Brook Farm.

(Continued from page 713.)

thought of his mother at her favorite seat by the kitchen window, just over which the white doves cooed all summer; he thought of Amy's brown head with the flicker of gold in it flashing in and out of the old rooms; and he thought of another sweet face, dearer than all the others, flitting from room to room, the blue eyes full of smiles, and the small lips full of snatches of old tunes—the face that would make the joy, and crown, and sanctity of his home He thought of all this, and it was too much—he bowed his head on his hands, and burst into tears.

"Reuben"—the voice of Farmer Ross certainly had a quiver of feeling in it, and the hard scrawny hand was laid tremulously on the youth's thick hair—"are you sorry to get the old place back?"

"Sorry!" he was answered when Reuben lifted up his face, "Oh, Farmer Ross, how can I thank you!"

"You needn't try. It's only makin' amends, you know, for, though the law was on my side, the Lord's shown me that I never had any right to the old Brook Farm; and I hope you'll forgive me for takin' it from you."

And Reuben Taylor took the old farmer's hand, and answered solemnly, "The Lord God is my witness that I do this hour.

It was an evening full of the glory of starlight and the crystal lustre of moonlight. The full, clear, silver light lay in rivers and lakes, over the meadows, and sheathed the limbs of the orchard trees, and slept in long glittering spears on the low roof of the yellow-brown cottage. Charity Ames sat under the small porch, on the low sill of the front door, and her sweet face looked out sadly on the night.

No wonder her heart was somewhat heavy as her thoughts slipped their cable and went out sadly to the future. She thought of her father who had complained that very afternoon that the crops "didn't promise over smart this year, and he didn't see his way clear to pay a dollar on the mortgage." She thought how old age was beginning and deepening the cares and burdens to creep more heavily upon him, which only his strong manhood could bear. She thought too of the years of "patient waiting" which would elapse before the lover of her youth could take her to his heart and home; and the tears came softly into her throat and eyes as she sat in the moonlight on the low sill, that summer evening. A quick step came along the grass. "Charity, little Charity!" exclaimed a voice which always made her heart leap. She sprang up, but not before he had seen the tears she thought she had hidden.

"I've got good news for you, Charity, glorious news!" The triumphant ring of his voice cut through the still night air.

"What is it, Reuben?"

"I've got back the old Brook Farm!"

"Oh, Reuben, I must be dreaming!" And she put her hand to her eyes, just as he had done that afternoon.

He slipped his arm around her waist. "No, it's true, every word of it, Charity. I've got the deed safe at home. I'll tell you all about it." And he seated her back on the door-sill, and knelt by her side, and related the story of his interview with Farmer Ross to the bewildered, delighted girl. "You ought to have seen how mother took it," he concluded, "I actually thought she was gone raving mad. She cried one minute, and laughed the next, and tossed her arms round, and it was a long time afore I could get her anything like quieted."

"Oh, Reuben, I am so glad, so glad!" Her joyful tears said the rest.

"I've got a few repairs to put on the old place, and by next fall, it'll be all ready for you, Charity, little Charity."

Her face fell in a burning blush on his shoulder, but in a moment it was lifted again, and the faith of her fathers broke triumphantly from her lips, in that grand old Hebrew chant, "O that men would praise the Lord for His goodness, and for His wonderful works to the children of men!"

Housekeeping for Men.

The man of the house made no motion toward rising, but simply raised his voice and called, "Ma! Ma!" getting louder and louder, until a faded woman made her appearance. He was robust and comfortable looking sitting there in the warmth of the autumn sun, while she was thin and care-worn. When she appeared he explained the case and waited for her reply. "These folks have had an accident, Ma, and they want some old cotton cloths. I didn't know whether you had any or not." Ma trotted away and brought out the desired article, saying meanwhile that she always kept a supply of old sheets and towels for such purposes. Her remarks were interrupted by the howls of her son, who shrieked out that he was hungry, and she hurried away to wait upon him. In less than an hour the husband and father and the three sons, all over ten, had made a dozen demands on her time, all trifling things that any well-trained man might have done for himself, or boy either. In response to any inquiry as to why she had never trained them to wait on themselves, she replied that it was easier to wait on them, and besides she didn't like to have men mussing through things.

Looking at her faded, anxious face one can't help wondering what those helpless men will do when she breaks down, as she is bound to do one of these days at the present rate. This scene reminded me by contrast of a comfortable farm-house where the "girls are all boys," but where order and peace and comfort reign, simply because the men of the family have all been trained to do housework in an emergency. Any one of the boys or the father can fry steak and ham, make coffee, get up good biscuits or corn bread, bake or boil potatoes, cook eggs, make toast, prepare rice and cereals and turn out a substantial meal on short notice. More than that, they can wash the dishes afterwards, and

can lay their hands on such of the household supplies as bedding, their own garments, towels and dish towels. I have seen men awkwardly trying to wash dishes with any sort of rag for a dish-cloth, from the floor-cloth to an article of dress, in a household emergency, but not in that home. The family has had its share of illness when it was impossible to procure help, but through it all, husband, sons and mother pulled together, and the result was most gratifying.

The easiest way to get the boys interested in housework, especially cooking, is to allow them to bring their friends home occasionally and have a "spread" in the kitchen. The only condition should be that the kitchen is put to rights afterwards, and this the lads will readily agree to do. Of course at first the corners will be neglected, and the dishwashing will give a neat housekeeper cold shudders, but in time they will do better. Boys dearly love fried fish, baked potatoes, oyster stews, fried chicken and a dozen and one other good things, and they should be allowed as many of them as possible, provided they show the right spirit in helping with the work later. It is a fine thing to have a thirteen-year-old boy kill, clean, joint and fry a chicken when company comes unexpectedly, and in reaching the place where he may do such things he learns lessons in anatomy, patience, cleanliness and skill that are worth a place in any one's education.

He learns that cakes and cookies require hard work on the part of some one; therefore, he will think twice before wanting to be selfish about them. He will also find that when he has company his mother has gone to much trouble to provide good things, so he is willing to take his share of the trouble. In one home, the twelve-year-old son waits on the table when there is company, doing the work noiselessly, with clean hands, and with everything about him clean, thus giving his mother added pleasure in her guests, and making her the envy of less capable friends. This boy can also wash and put away the dishes as well as any girl when occasion demands. His wise mother does not impose upon him, but rewards him freely for every effort in her behalf so that the housework is not irksome to him.

In many homes the mother lays out every clean garment and hunts up every tie, button and handkerchief for the father and boys—a very foolish proceeding, unless she can hire a servant for the regular work, and only have that for pastime. Many little girls are brought up to think it is their duty to wait upon their brothers, when in reality the brothers should be able to wait upon themselves. The boy who cannot sew on a button, hunt up his own shoe strings, find his socks and handkerchiefs, and be able to get dressed without causing a commotion upstairs and down has been cheated of his rights by his doting mother. If he goes from home on business his clumsy fingers must learn all these necessary things when he should be doing something else, and if he marries, his wife must begin his education twenty or thirty years late, or else forever wait upon him. A little course in cooking, sweeping, finding his own things, and helping with the housework in emergencies will hurt no boy, but it will make of him a more manly man and a better citizen.—Hilda Richmond in Country Gentleman.

FLORICULTURE.

All enquiries in this department will be answered by H. E. Goold, Florist, Sussex, N. B.

Writer says:—My pansies seem to be a total failure this season. In many sections of the country affected by fog, many places where good healthy plants have been planted they have grown smaller rather than larger and do not seem to have any vitality. No trace of insect ravages can be found and it really seems that the cold wet spring is entirely responsible.

This is undoubtedly the greatest season for weeds that we have had for years. The only safe way to kill them this year is to pull them and cart them to the compost heap.

Your Sweetpeas would appreciate a top dressing of hard-wood ashes applied six inches from the stalks of the plants and stirred into the soil Great care should be taken that the ashes do not touch the vines as they would be sure to burn the foliage.

In watering your Century plants care should be taken that water be not allowed to stand in the hollow of the leaf as it is almost sure to burn the leaf when exposed to the hot sun. See that the drainage is good in the pot and give your plant plenty of water. I would think that correspondent's plant having leaves decay at the tops was afflicted by poor drainage and consequent souring of the soil.

Pick off all the seed pods on your annuals; you will find that it adds much to their blooming qualities and sightly appearance. This rule applies, especially, to poppies, on? pod of seed of this plant will infect a square yard of surrounding garden.

Every gardener should have a manure water barrel in one corner of his lot. Get an old oil barrel, bore a hole in the side near the bottom then get a cheap molasses faucet and insert it in this hole. Raise the barrel about two feet from the ground so that you can put your watering can under the faucet. Put about six inches of good excelsior in the bottom of the barrel so that the coarse manure will not choke the faucet and then use about one quarter of a barrel of good, fresh cow manure to a full barrel of water and stir frequently while using. Use fresh manure to every three barrels of water.

Of course the conditions of the soil would regulate the frequency of use but for ordinary soil I would think about twice a week would be about right. Sandy soil would take it much oftener than many clay soils.

The rose slugs have commenced their ravages on the out-door roses. Hellebore should be applied at once, as a precautionary measure, even if the slugs are not yet in sight. Use a lgrge spoonful of hellebore to a watering can of water and stir continuously while applying.

Pin the branches of the verbenas to the ground as soon as they begin to run. You will find a hair pin a good thing to use if the soil is not too light.

If you have any beds of hardy bulbs hyacinths, tulips, etc., that have been planted several years and have become crowded and need replanting, from now until the last of August is the time to lift the bulbs as this is their dormant period. After lifting the bulbs, which are now free from roots and tops, they can be immediately replanted or dried off in a cool, shaded position and kept in a cool, dry position to be planted out again at any time before the ground is frozen up. They do better if planted out before the middle of October. All bulb beds should be well drained so no surface water will stand on them in winter; otherwise losses will result.

Proper Lubrication

For Traction Engines, Wagons, Etc.

Mica Axle Grease

makes the wheel as nearly frictionless as possible and reduces the wear on axle and box. It ends axle troubles, saves energy in the horse, and when used on axles of traction engines economizes fuel and power.

Plows, Harrows, Drills, — **Granite Harvester Oil** insures better work from the new machine and lengthens the life of the old. Wherever bearings are loose or boxes worn it takes up the play and acts like a cushion. Changes of weather do not affect it.

Gasolene and Kerosene Engines — **Standard Gas Engine Oil** is the only oil you need. It provides perfect lubrication under high temperatures without appreciable carbon deposits on rings or cylinders, and is equally good for the external bearings.

Steam Traction Engines and Steam Plants — **Capitol Cylinder Oil** delivers more power, and makes the engine run better and longer with less wear and tear, because its friction-reducing properties are exactly fitted to the requirements of steam traction engines and steam plants.

Every dealer everywhere. If not at yours, write for descriptive circulars to

The Imperial Oil Company, Limited

I will mail, **free** of any charge, my **home treatment** with full instructions to any sufferer from women's ailments. I want to tell **all** women about this cure—**you**, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourself at home without the help of a doctor. Men **cannot** understand women's sufferings. What we women know **from experience**, we know better than any doctor. **I know** that my home treatment is a safe and sure cure for **Leucorrhœa** or **Whitish discharge, Ulceration, Displacement** or **Falling** of the **Womb, Profuse, Scanty** or **Painful Periods, Uterine** or **Ovarian Tumors** or **Growths,** also **pains in the head, back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weakness peculiar to our sex.**

I want to send you a **complete 10 days' treatment entirely free** to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that **it will cost you nothing** to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week, or less than two cents a day. It will not interfere with your work or occupation. Just **send me your name and address**, tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by **return** mail. I will also send you **free** of cost, my book—"**WOMAN'S OWN MEDICAL ADVISER**" with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it and learn **to think for herself.** Then when the doctor says "You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures **all, old or young.** To **Mothers of Daughters,** I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness, and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this **Home Treatment** really **cures** all women's diseases and makes women well, strong, plump and robust. **Just send me your address**, and the free ten days' treatment is yours, also the **book.** Write to-day, as you may not see this offer again. Suffered from Heart Trouble and Nervousness for Six Years

Lost All Desire To Live.

WAS FINALLY CURED BY THE USE OF MILBURN'S HEART AND NERVE PILLS.

Mr. Regis Lavallee, Sorel, Que., writes: "For six years, at least, I suffered from heart trouble and nervousness which took from me all desire to work and even to live.

"When I found myself in this condition and getting worse I took the medicine the doctor prescribed for me but without any result.

"One evening I was reading the paper when I saw your advt., so cut it out and the next day went to the druggist and procured a box, and since that time my nervous system has been in perfect condition.

"Be assured, gentlemen, that I will never be without Milburn's Heart and Nerve Pills for they gave me strength to work and support my mother, who is an infirm widow and of whom I am the only support."

Milburn's Heart and Nerve Pills are 50c per box, or 3 boxes for $1.25, at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

C. C. RICHARDS & CO.

Dear Sirs,—For some years I have had only partial use of my arm, caused by a sudden strain, I have used every remedy without effect, until I got a sample bottle of MINARD'S LINIMENT. The benefit I received from it caused me to continue its use, and now I am happy to say my arm is completely restored.

Glamis, Ont. R. W. HARRISON.

SEALED TENDERS addressed to the undersigned and endorsed "Tender for Extension to Breakwater at Dipper Harbour, N. B.," will be received at this office until 4.00 P. M., on Monday, September 26, 1910, for the construction of an Extension to the Breakwater at Dipper Harbor, St John County, N. B.

Plans, specification and form of contract can be seen and forms of tender obtained at this Department and at the offices of E. T. P. Shewen, Esq., District Engineer, St. John, N. B. Geoffrey Stead, Esq., District Engineer, Chatham, N. B., and on Application to the Postmaster at Dipper Harbour.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and signed with their actual signatures, stating their occupations and places of residence. In the case of firms, the actual signature, the nature of the occupation, and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Honorable the Minister of Public Works, for the sum of two thousand one hundred ($2,100.00), dollars, which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By order,
R. C. DESROCHERS,
Secretary.

Department of Public Works,
Ottawa, August 24th, 1910.

Newspapapers will not be paid for this advertisement if they insert it without authority from the Department.

Our Prince Edward Island Letter.

Editor Maritime Farmer:—

Grain cutting is well under way, and crop is turning out well above the average. On well drained, fertile soil, oats are an immense crop; wheat and barley are also heavy and well filled; corn and roots are growing fast and will be easily a good average yield, all of which, along with our phenomenal crop of hay, will give this province an uplift the effect of which will be felt for years, if the best possible use is made of all this surplus feed. Fortunate indeed is the farmer who finds himself well stocked up with any or every kind of farm animals.

The want of manure is the continued cry here, and if ever some farmers are going to get any greater quantity ahead to be able to grow more roots and corn, this is surely the year. Hay is worth very little in most sections and grain is always comparatively low at the season when the great bulk is marketed, but a splendid market has opened up for our finished products during the last few years and these can be transported across our costly water route much cheaper than can the raw products.

That it pays to feed our raw products at the present prices for finished products is beyond question. The reason why so many in this province think differently, is due to the fact that where farmers are shipping their raw crops and each and every one receives the same prices and there can be no dissatisfaction; but where these same farmers attempt to turn this into any finished product or live stock many conditions arise that affect their profit. So much more depends then upon the skill and ability of the feeder on the class of stock kept, on the housing and care and includes all the little details that tend to greatly change the success that one man can have over another above what is possible in shipping raw produce, that great dissatisfaction is sure to arise, and many quit in disgust a business that they never stuck to long enough to properly learn or master. The greatest trouble, too, is that considerable capital must be invested in this to get the greatest profit and returns are slower coming in. This province, however, is very slowly changing in the proper direction but there are oceans of room for improvement along this line.

We have had a visit lately from the Royal Commission on Technical Education, (the great panacea now for all our ills.) This latter seems to include all our necessities imaginary or otherwise, and might have, (had it been organized a little earlier) taken over the little cruise of the Commission on Bacon Hogs. We wonder who next will be agitating for a commission—one to investigate our transportation difficulties will now be in order. However, we hope great good will eventually come of Technical Education, especially so far as it will apply to agriculture.

At the meeting held in Summerside, quite a number of farmers, amongst others, were examined under oath, after a discours? by Dr. Robertson, intimating that he did not want to hear any speeches, etc. If he got all the information he wanted out of the few questions put, there certainly wasn't much information required. The idea seemed to be that more illustrations or demonstration work should be grafted into our children's education. It seems we have been educated clean off the land, taught anything but our own business and now we are to have our children taught by "properly trained teachers" to love farm life, to create a fondness for nature and all the beautiful things that grow around them that they never noticed before, all of which is right enough if not carried to extremes. If we can just strike the happy medium in how far to push this new doctrine without working in so many frills that it makes our schools ridiculous it will be all right, but I am old fashioned enough to believe that many of these problems we are asking our leaders in educational matt?rs to solve in reference to the training of our children can be taught by parents alone. If we could inject the germ of good, sound common sense into all the parents we would not hear much about the problem of keeping boys on the farm or any other place where they are properly influenced to stay. Children inherit their parents' dis- parents have the wisdom to govern their training and according as the parent has the wisdom to govern themselves in the life they would wish their children to follow along with their proper guidance and connection, so will the child follow. Many things, such as morals, temperance and the liking or disliking of any occupation in life can never be taught in our public schools. The child must "live" in them long before its earliest recitation. I do not mean to infer that improvement cannot be made in our present school system but many things in this new education can only be taught at home.

Rabies—Hydrophobia

During the past year there have been many cases of rabies reported in the United States and Canada, which have caused much loss of live stock, mostly cattle, hogs and horses, and in several localities people have been bitten by rabid dogs.

This is one of the oldest diseases known. In the fourth century B. C. it was described by Aristotle, who wrote: "Dogs suffer from a madness which puts them in a state of fury, and all the animals that they bite when in this condition become also attacked by rabies."

The season of the year makes very little difference, as the disease is just as prevalent in winter as it is in summer. This seems contrary to the ideas of many people, who think that July and August, "dog days," is the only time that dogs are subject to rabies.

Cause.—Rabies is caused in nearly all cases by the bite of a rabid animal. It is possible to contract the disease from the saliva, the tears from the eyes or the milk of a rabid animal. The rabid dog is a source of danger a few days before the symptoms of the disease appear, but in no case before he was bitten by a rabid animal, or otherwise inoculated. Hot weather, lack of water or ill treatment will never in themselves produce rabies.

The dog is the principal source by which rabies is spread over the country. The freedom which he is given, his natural manner of self-protection, and his tendency to roam about bring him in contact with many other animals. Cats, hogs, horses and cattle, in the order named, are less dangerous than the dog.

Symptoms.—The symptoms seldom develop in less than fourteen days after the animal was bitten—most commonly three to six weeks—but they may not show for six months to a year. Not all animals bitten develop the disease. It depends some upon the part of the body which was bitten. In man there is less danger if bitten through the clothing than upon the bare parts of the body, as the hands or face, the latter place being less dangerous. It is not uncommon for the symptoms to develop in less than two weeks when bitten upon the head.

The symptoms show in one of two forms—furious or dumb.

Furious Rabies.—With the furious form the dog is at first noticed to seek the company of his master more than usual, or he will hunt dark, secluded places. Sometimes he will make sudden starts towards objects. These conditions last for a day or two. Later he becomes more restless, wanders about, and will often travel twenty to thirty miles in a day. While he is on this trip he is very likely to bite cattle, hogs and dogs, often passing horse and man, unless they interfere with his course. He will usually return home unless he is killed. During this period he is irritable, seldom eating or drinking, not because he does not want food or water, nor because he is afraid of water, for he is not, but fram the fact that his throat is paralyzed and he cannot swallow. Often he will force sticks and stones down his throat in efforts to satisfy hunger and thirst. This period of irritation lasts for two to three days, followed by a period of paralysis, which has already taken place in the throat, as shown by the voice, which has already changed to a prolonged howl, and the inability to swallow. This is followed by paralysis and death, the entire symptoms lasting from four to ten days.

Dumb Rabies.—The dog seeks his master's company or may hide in dark places, being unable to eat or drink, the lower jaw hangs down and the tongue protrudes, which may swell and turn dark. This condition is followeh by paralysis and death in four to ten days after the first symptoms appear. Either form of the disease may change to the other in the same animal.

Symptoms.—In Cattle. They are prone to chase chickens, dogs, and may run at man, whom they are less apt to attack. Often falling down from no apparent cause, twitching of muscles, inability to eat, due to paralysis, often showing signs of sexual excitement even when pregnancy is well advanced, but seldom biting. These symptoms are followed by paralysis and death.

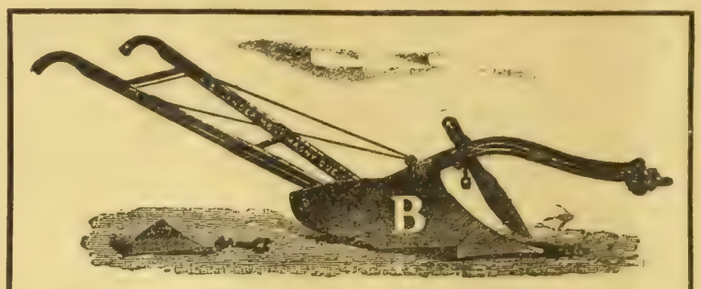
The Horse.—Is often more vicious than cattle, biting the manger, himself, or anything within reach; also showing many of the same symptoms which are shown by cattle.

The symptoms of rabies vary greatly, but in general there is a first stage of melancholia lasting two or three days, followed by a period of excitement which lasts two to three days more, followed by a period of paralysis. Death usually occurs inside of ten days after the first symptoms appear.

Diagnosis.—This is made from microscopic examination of the brain, which shows small round or oval bodies from 1-25000 to 1-1000 of an inch in diameter. These are called Negri bodies, as they were first noticed by a man by the name of Negri in 1903. They have never been found in the brain of an animal unless the animal has been in-

This Plow Is Specially Made For Quebec And The Maritime Provinces

THIS is a plow which we build specially for use in the Maritime Provinces and the Province of Quebec,—is equipped with a mouldboard especially adapted to the soil. We have made a marked improvement in the turn of this mouldboard which makes it much easier for the plowman to hold. For general use in these provinces, except for new, unbroken hard ground, we strongly recommend it. The mouldboard, like on all "B" Plows, is made from special soft-centre steel, and the construction throughout is the very best. Look for the "B" on the mouldboard when you buy; it is your guarantee of quality. This plow will scour in the most difficult scouring soils and, if fitted with our wheel attachment to go under the beam, can be handled with ease by a boy. **If your dealer cannot supply you, write us and we will tell you who can. Tell us the type of soil on your farm and we will see that you get the exact style of mouldboard your land requires. We send our Catalog free on request.**



This is the Plow for Quebec and the Maritime Provinces. Our "B" No. 6.

THE Maritime Farmer TENT

WILL be on the exhibition grounds at the three Provincial Exhibitions—St. John, Halifax and Charlottetown—where we will be glad to meet all of our friends. If you happen to be at these exhibitions and want to write a letter home or to a friend please remember that you will always be welcome to do so at our tent. Writing paper and envelopes will be furnished free. If you owe us a dollar or so we will be pleased to see you. If you have a friend who does not take the MARITIME FARMER bring him to see us. You will be doing him a favor and helping us at the same time. If you get tired of seeing the sights and want a place to rest come to the tent, you will be welcome. If you are thinking of advertising, come and see us, we will be pleased to furnish you any information we can with reference to same.

No mattter what you are doing at these exhibitions do not forget us, we want to see you. We will do our best to make it pleasant for you.

THE MARITIME FARMER,
SUSSEX, - - - - N. B.

COME AND SEE US.

oculated with rabies virus; therefore when Negri bodies are found in the brain of an animal there is no doubt that the animal had rabies.

There are also changes in the nervous ganglia in the last stage of rabies. These changes are also found in other diseases, which makes this manner of diagnosis more uncertain and of little use in the early stages of the disease. Sticks and stones may be found in the stomach of a rabid dog.

Treatment.—This consists of a preventative treatment (Pasteur): which must be taken before the symptoms have developed. In order to be effective it should be taken within a few days after having been bitten by a rabid animal. The treatment may also be given to valuable domestic animals. The "mad stone" is of no use as a prevention of rabies.

What is Bran?

Consumers of concentrated feeding-stuffs have for years at times found more or less occasion for complaint in reference to their quality. This finally resulted in the passage of a State law nearly two years ago, which, as amended last winter, is still in force. In its present form it requires no registration or special guaranty or tagging for pure bran or pure shorts, while impure feeds of the general nature of these must be registered as mixtures and be labeled so as to show the net weight of the package, the name and address of the manufacturer, the name of the feed, and a guaranty as to the percentage of fat and protein. Hence a definition or description of pure bran becomes of considerable importance to manufacturers and consumers alike.

The chemist of the Experiment Station, who is by the law charged with the duty of inspecting feeding-stuffs in person or by deputy, holds that bran to be pure must not include anything that is separated from the wheat in preparing it for the milling process. Some wheat as marketed contains bits of straw, broken weed stems, oats, cheat and other foreign substances that must be removed before the wheat enters the rolls for grinding. All such screenings must be excluded if the bran is to be classed as pure.

The shrunken wheat unfit for flour-making and also removed in this preparatory progress is doubtless of equal feeding value with the bran, and its presence in bran is not economically objectionable, though technically an impurity. This shrunken wheat is by some millers ground and separated into a coarse part and a fine part, the former being put into the bran and the latter into the shorts. Such action is held to be legimate, but this should not be taken as an approval of the introduction in a ground state of the other light materials of little feeding value. If such materials, either ground or unground, are marketed with the bran the product must be sold as "bran and screenings," and under the general label and guaranty referred to, and must be registered with the Director of the Experiment Station.

Some millers who make corn-meal dispose of the corn bran, separated in that process, by mixing it with the wheat bran. This practice is not legitimate, and if followed the mixture must be designated as "wheat bran and corn bran" and be registered and labeled as described above. 8

Millers can adopt and maintain a high standard for their bran, and put out a product in which they can take pride, only by keeping out all adulterations. These by-products of questionable character can be disposed of without loss by making a mixed feed with which they may be incorporated, which must of course be registered with the Director of the Experiment Station annually and carry the proper label and guaranty. Purchasers will then know what they are getting, and bran will be of a uniformly high grade.

Attention may also be drawn to the fact that the rulings above stated are in harmony with the policy of the federal authorities in respect to mill products entering interstate commerce.

Consumers of bran and other concentrated feeding-stuffs are invited to bring to the attention of the chemist of the Experiment Station any evident disregard for the provisions of the feeding-stuffs law, bearing in mind that accidents are liable to occur in any establishment, and that millers as a class are of a high order of honor and integrity.

J. L. WILLARD,
Chemist Experiment Station.
Manhattan, Kan.

Are You Going to Build?

One Great Problem Before You Is YOUR ROOF

To settle it right will save you cost of repairs and a new roof—to settle it wrong means dissatisfaction from the start.

You read many extravagant claims; you are frequently confronted with high-sounding guarantees; you have heard of countless brands of roofings, but there's only one way to tell the good from the bad. *Make them show you what they've done.*

We are ready to show you actual buildings in your neighborhood where NEPONSET PAROID Roofing has been on roofs for years. The money saved in repairs more than offsets the difference in price between BIRD NEPONSET Roofings and the cheaper kinds. Back of Bird NEPONSET Products are records of long service and 115 years of experience in one line of business. We originated the ready roofing idea and make different roofings for different classes of buildings.

NEPONSET PAROID Roofing

for your barns, poultry buildings, etc., gives service equal to that of highest grade shingles

Unlike shingles, it resists fire, doesn't blow off or deteriorate. NEPONSET PAROID has been in service for twelve years on United States Government, Railroad, Industrial and Farm Buildings, in all climates. If it meets these severe conditions, it will surely meet yours.

NEPONSET PROSLATE Roofing and Siding, for dwellings and all other buildings where artistic results are desired. It is more attractive than shingles, wears like slate, makes an attractive-looking roof, resists fire, saves money and always gives satisfaction. It may be used on exterior walls in many attractive ways.

For such poultry buildings, brooder houses, sheds and temporary buildings as require a low-cost roofing, you should use NEPONSET RED-ROPE Roofing rather than tarred felts — more satisfactory in every way — it has been the standard low-cost roofing for 25 years.

NEPONSET BLACK WATERPROOF Building Paper, under clapboards, shingles, slate, metal, etc., insulates against exterior heat, cold and dampness. It costs little and cuts the fuel bill one-third every winter.

NEPONSET FLORIAN Sound-Deadening Felt, for floors, partitions, etc., to deaden sound. Six times as efficient as ordinary deadening felt.

These are facts and not claims—write us and we will prove every statement

Consult Our Building Counsel Department

Tell us the nature of the buildings you propose to erect or repair and we'll send you the BIRD NEPONSET Book which treats your special case. There are dealers in BIRD NEPONSET PRODUCTS everywhere. If you don't know the one in your locality, write us and we'll tell you.

Feeding Brood Sow.

A. B., Sunbury Co., N. B.—I have a brood sow due to farrow in October. Her feed is mainly rape, and is housed in a 10x15 foot building with elevated bed-floor. There is a large out-door pen she is sometimes let out to graze for an hour. She does not seem to require ashes. She gets a small quantity of milk and an offer of water nearly every day. Is it better to give her some ground feed and how much. Have a mixture for gigs of 100 lbs. good middlings to about 80 of bran. Ought she to have some of this? Is it possible to over-fatten on a diet of rape? She fattens very easily and has already had two litters. Her second farrowing was difficult. I am anxious to get some advice as her mother died at third farrowing. Please advise.

Ans.—Your sow should do all right under present system of care and feeding. Allow her all the freedom you can so that she will get a sufficient amount of exercise to keep her in a healthy condition so that she may assimilate her food. Providing she has sufficient exercise we do not think she will fatten too much on rape. We would advise supplementing the rape and milk feed with a small quantity of the mixed feed referred to. We would keep water before her constantly.

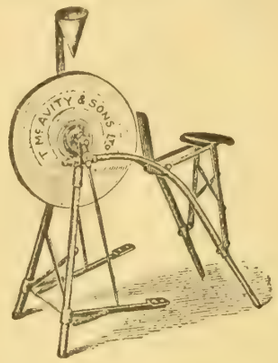
McAvity's Messenger.

On receipt of price we will deliver any goods in this advertisement, except Iron Pipe, freight, express or mail CHARGES PAID to your nearest railway station or express office anywhere in the Maritime Provinces.

This offer holds good only for a limited time and when ordering mention Dept. F.

Bi-Treadle Grindstone

Strong, Durable Steel Frame.

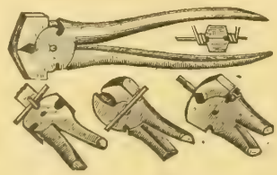


No need to have a boy turn this Grindstone. It runs like a bicycle. You sit down on the seat and work the treadles with both feet. Your hands are free to attend to the grinding of tools of all kinds.

It is shipped knocked-down, stone and frame crated together, stones about 22 inches in diameter, 2 inches thick.

Each.....$5.00

Combination Pliers



Ten tools in one, staple pullers, two wire cutters, two hammers, one pair pinchers, one monkey wrench, one wire splicer and one wire stretcher. A very handy and high-grade tool.

Each.....80c

Bread Makers

Make the wife's work easier by spending $2.25 or $2 75 for a Bread Maker. Mixes and kneads dough thoroughly in three to five minutes and makes perfect bread. Easy to work.

4-Loaf size.....$2.25
8-Loaf size 2.75

Creamery butter, 25c to 26c; dairy tubs, pound, 22c to 23c; dairy rolls, 20c to 21c; dairy prints, 23c to 25c; eggs, new laid, 22c to 23c; cheese, 12½c to 13c.

Flour, hard wheat, per bbl., $6,75; flour Ontario, blends, per bbl., $6,00; rolled oats, $5.25; cornmeal, per bag, $1,70; oats, per bush., 52c to 55c.

Pork, Am., bean, per bbl, $26,00; pork, clear, per bbl., $28,00; hams, fresh, per pound, 16c; hams, smoked, per pound, 20½c; turkey, per pound, 17c; geese, pound, 20c; ducks, 20c; fowl, pound, 15c; beef, fore quarter, per pound, 8c to 9½c; beef, hind quarter, per pound, 10c to 12c; beef, American plate, bbl., $21.00; beef, Canadian per bbl., $18.50 to $20.00; lambs, pound, 11c to 12c; pork, pound, 10c to 12c; bacon, pound, 20c; mutton, per pound, 7c to 8½c, veal, per pound, 6½c to 8c.

New potatoes, bbl., $2 20; onions, Valencias, pound, 2½c; cabbage, native, crate, $1.25; lettuce, dozen bunches, 50c; tomatoes, Ontario, basket, 45c to 50c; tomatoes N. S., box, 40c; rhubarb, native, pound, 1½c; apples, Am., basket, $1.75; apples, Am., bbls., $4.00 to $4 50; apples, N. S., bbl., $1.25 to $3 50; turnips, dozen bunches, 50c; beets, dozen bunches, 50c; carrots, doz. bunches, 50c; celery, doz. bunches, $1.50.

FRUIT AND VEGETABLES.

Dealers report business still in good volume and collections fair. The trade in bananas is dropping off somewhat as is usual when our native fruits come to hand more freely.

The city market has been depending almost wholly upon Dartmouth farmers for new potatoes, but this source of supply is now stopped, owing to a very small crop.

Dealers are now drawing supplies from P. E. Island and Annapolis Valley.

A car of Ontario fruit has just arrived by freight, which has allowed our dealers to sell somewhat cheaper than usual, as this class of goods usually come by express at a much higher cost of transportation.

Tomatoes, both Ontario and Nova Scotia, are considerably lower at 40 to 55 cents.

Raspberries and American apples (in baskets) are done. American (barrels) and Nova Scotia are a little easier at $4,00 to $4.50 and $1.25 to $3.50 per bbl.

Ontario plums and peaches are quoted to-day at 60 cents box, and 75 cents a basket.

Among vegetables native cabbage are lower at $1.25 crate, and potatoes at $2,10 bbl.

Crop Reports.

W. J. CARSON, GREEN ROAD, CAR. CO., N. B.

The potato is the main crop in this section and the principle one throughout the county as the soil, in general is well adapted for growing tubers My idea is, that take one year with another, the farmer who has soil adapted for growing potatoes and applies itto potato growing, can compete financially with his neighbor, who has similar soil applied to the growing of some other crop. The potato crop is a speculative one. When I say speculative,I mean that the potato is a perishable commodity that is subject to the risks of early blight, late blight, rust, bugs and rot to which other products of the farm are not subject. Notwithstanding the extreme rotten condition of last year's crop and the ensuing low prices which brought in their wake very heavy losses to most of our farmers, this season found our men buying fertilizer and planting more potatoes than ever before, which is ample proof that all those who have soil adapted to potato growing, consider the potato one of the most profitable products of the farm Although last year brought complete failure so far as crop and prices were concerned, the previous seasons gave good crops and prices ranging from $1,00 to $1 75 per barrel and in many instances the yield was better than 100 barrels per acre, which gave the farmer a double, jes, more than a treble profit than he could have got per acre from any other ordinary crop,

The potato crop in this section promises to be fair, although the rust is quite general, but it cannot do much harm to the early planted fields. Owing to the late, wet spring and the consequent late planting, quite a large percentage of the crop will be damaged, as the tubers are not yet more than half grown. There is no rot noticeable as yet, except a very little in the Irish Cobblers. The weather is very dry and if it continues so, it will ensure us good, sound crop, but we do not look for much shipping before the 5th of September, when the prices will be fair.

Our hay crop is good, the best for a number of years, and it has been harvested in very good condition Oats are also good and harvesting is in full swing. The prices for hay and oats will be very satisfactory.

R. F. SMITH, EAST FLORENCEVILLE, N B.

The hay crop in this county has been the heaviest we have had for years, clover growing in large quantities, The crop has not been harvested in first class condition, although there will be a large quantity of good hay. The farmers use as much caution as they can in taking their heaviest clover and dark grades of hay for the feeding of their stock, that portion that was harvested in best condition has been set aside and will be marketed during the coming season.

The oat crop is also looking well and if it is harvested in good condition, will not only be good quality but good yield

Potatoes It is too early to give an accurate idea as to how this crop will turn out, the fields at present are looking well and we think there will be an average yield, some specimens which have already come to my notice cook well and seem to be free of disease of any kind.

Wheat is only a fair crop and rust has struck it in some sections, Other vegetabe crops are looking well and taking it altogether Carleton County will have, generally speaking, a very heavy crop.

DRAINING TILES WANTED.

R. Y. Tracey writes, I have started draining by open ditches and mean to use tiles for the laterals if I can get them at a reasonable price. I never see tiles advertised in the MARITIME FARMER. Are there tile works in the Maritime Provinces? Can you tell me of any one from whom I can buy tiles? I've had considerable experience in tile draining, in the west of Scotland years ago, I know its value.

EDITOR'S NOTE:—

Will some of our readers tell us where drain tiles can be procured in the Maritime Provinces.

EYEBRIGHT, J. H. G., CUMBERLAND, CO. N. S.

I am enclosing specimens of a weed which grows in our district and which is ruining our grass land by killing out the grass. Would you kindly tell me what they are and how to eradicate them,

The specimens sent are very dry and it is somewhat difficult to make an exact determination but I think it is Eyebright(Enphrasia officinalis) which is usually rather common along the sea coast in particular. It is not considered a bad weed but may sometimes annoy the farmer. It is usually got rid of quite easily by cultivation.

ABSORBINE

Removes Bursal Enlargements, Thickened, Swollen Tissues, Curbs, Filled Tendons, Soreness from any Bruise or Strain, Cures Spavin Lameness, Allays Pain Does not Blister, remove the hair or lay the horse up. $2.00 a bottle, delivered. **Book 1 D free.**

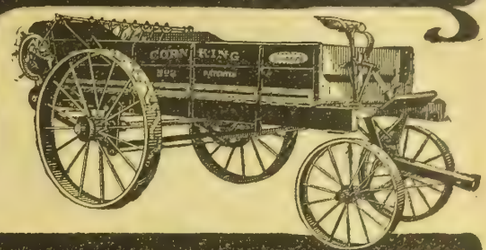
ABSORBINE, JR., (mankind$1.00 bottle.) For Synovitis, Strains, Gouty or Rheumatic Deposits, Varicose Veins, Varicocele, Hydrocele. Allays pain. Book free.

W. F. YOUNG, P.D.F., 124 Temple St., Springfield, Mass.
LYMANS Ltd., Montreal, Canadian Agents.

"Can be depended upon" is an expression we all like to hear, and when it is used in connection with Chamberlain's Colic, Cholera and Diarrhoea Remedy it means that it never fails to cure diarrhoea, dysentery or bowel complaints. It is pleasant to take and equally valuable for children and adults. Sold by all dealers.

Don't waste your money buying plasters when you can get a bottle of Chamberlain's Liniment for twenty-five cents. A piece of flannel dampened with this liniment is superior to any plaster for lame back, pains in the side and chest, and much cheaper. Sold by all dealers.

Better Crops-Bigger Profits Certain Results From Using IHC Manure Spreaders



THINK what it would mean to you to get a bigger, better, evener crop from every acre of your land.

Make the bare spots fertile—the rich soil even richer—thus increasing its value every year.

I H C manure spreaders are doing this for hundreds of other progressive farmers. Why not for you? They are the only practical solution of the problem of keeping your soil in such condition that it will always yield a bumper crop.

Barnyard manure is one of the cheapest and best of all fertilizers. It is something you always have in abundance, but—

To get its full value—to make it do its work as a fertilizer so as to bring the best results—you must spread it in the right way.

You can do this quickly and with greatest economy with one of the

I H C SPREADERS

CORN KING **CLOVERLEAF**

They are easily adjusted so you can apply the manure in just the amount required by the different conditions of the soil in different parts of the field Simply shifting a lever regulates the amount thrown out by the beater.

The beaters on I H C spreaders are correctly designed. They pulverize the manure—no large chunks are ever thrown out.

Light draft is another feature of I H C spreaders. They have wide tires and roller bearings.

The frames of I H C spreaders are made of non-porous, heavy, hard, resinous wood stock, air dried so that the sap is retained. Compare this with the kiln dried wood used in many. When wood stock is air dried the resin cements the fibres together making it practically impossible for manure liquid to penetrate. Manure acids have no effect upon it.

The Corn King Spreader is of the return apron type. Cloverleaf Spreaders have endless aprons.

Lime hoods for spreading commercial fertilizers and drilling attachments to distribute manure in rows can be furnished on special order if desired.

All spreaders look very much alike—but it's their work in the field that proves their value. Examine the record of the I H C spreaders, compare them with others and you will be convinced.

Ask the I H C local dealer for proofs. Go over with him the details of their construction. Choose a Corn King or Cloverleaf—whichever meets your particular need best. All are made in several sizes ranging from 30 to 70 bushels capacity. If you cannot get in to see your dealer right away, write nearest branch house for catalogues and full information.

Your complexion as well as your temper is rendered miserable by a disordered liver. By taking Chamberlain's Stomach and Liver Tablets you can improve both. Sold by all dealers.

The PUBLISHER'S DESK.

Gas generated by heat from black oil, a by-product of petroleum, used as a lubricant on bearings, and not smut in wheat, as generally believed, is the sole cause of explosions in threshing machines. The use of lard, castor or china-nut oil eliminates all danger of fire or explosion, no matter how much smut there is in the grain. That is the theory advanced by Silas Privett, of Colfax, Wash., a thresherman of 25 years' experience in the northwest, who has operated 10 years in the Palouse wheat belt, south of Spokane, where 27 machines were destroyed in a single season, a few years ago. Mr. Privett believes he has made a discovery which will re-

ONE OF THESE "SWISS ARMY" RIFLES FOR SEVEN NEW SUBSCRIBERS

We have purchased several hundred Swiss Army Rifles, They are repeating Rifles, holding 12 cartridges, 42 calibre, in the magazine and one in the chamber. The action is the reliable bolt type, and works quickly and smoothly. The barrel is rifled and is sighted for long ranges The front sight is open and the rear sight adjustable for elevation. **Guaranteed perfect.** This is the famous "Swiss Army" rifle. It is splendid for hunting deer and larger game etc. No one living in the country should be without one of these rifles Only a limited number to be obtained. If you want one you should start to-day to secure seven new subscribers. If you intend earning a rifle drop us a card to-day and one will be reserved for you as long as they last. Don't delay, start to-day.

Address—**MARITIME FARMER, Sussex, N. B.**

sult in the saving of thousands of dollars a year to farmers and threshermen in the United States and Canada where smut is prevalent. Explaining his theory, Mr. Privett said that black oil produces explosions in the same manner they are created in a gas or gasoline engine. The heat generated by the bearings of the rapidly revolving machinery, upon which the petroleum product flows constantly while in operation, generates a gas, and when a spark, caused by the passing of a hard substance through the machinery or the striking of the cylinder teeth against the teeth in the concave, comes into contact with this gas, an explosion results. He added: "I have been studying this problem for years, but said nothing about it until after I had made a thorough investigation. As a result I am more convinced than ever that the majority of these fires, if not all of them, can be directly traced to the use of black oil. "I am not trying to put John D. Rockefeller out of business, but I wish the professors at the state colleges and experimental stations and experts would test my theory and see if there is not a real foundation for this theory. If they will make tests of this oil under the same conditions that are supposed to bring about a smut explosion, I am sure they will get an explosion without using smut. I began operating a threshing machine when I was 15 years of age and continued in the business for 25 consecutive years, and I do not believe that there is a man to-day in the country who has threshed any smuttier wheat than I have, yet I have never had an explosion, neither have I ever used anything but castor, lard or chinanut oil. I have also noticed that while there have been from 10 to 25 fires every fall in Whitman county, supposed to have originated from smut, there are three or four threshing outfits which have threshed theough the same kind of grain season after season without any fires. I also know that the men having charge of these machines will not allow anything but castor or lard oil to be used. Two points in Mr. Privett's theory are borne out by the so-called smut explosions in the Palouse county. One is that while threshers have been handling smutty wheat in the district for years without explosions, when the fires did begin not less than 27 machines were destroyed. The second is that neither before the epidemic of fires nor since that time has a machine on which castor or lard oil was used been known to generate fire in its interior, while those on which black oil was used were destroyed by fire with alarming frequency.

HORSEMEN ATTENTION!

Dr. J. Woodbury's Horse Liniment and Dr J. Woodbury's Condition Powders will save and preserve the life of your horses. They cure Cough, Cold, Distemper, Colic, Glanders, Spavin, Pink eye and all diseases of the Horse.

TRURO, N. S.

Dear Sirs,—One of my horses had a bad cough, and I made a complete cure with three bottles of Dr. J. Woodbury's Horse liniment. The cough was of twelve months standing. In my large expeience with horses, I consider this liniment to be the best made for all diseases of the horse, and I recommend it to my friends.

E. J. ANDERSON.

BEAR RIVER, N. S.

DEAR SIRS,—

We do not hesitate in recommending your Dr. J. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts, and would say that no lumberman should be without it.

Yours truly,

CLARKE BROS.

1 Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only one cent a word, you can advertise anything you wish to buy, sell or exchange. The address must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issue. No black faced type or display of any kind will be allowed under this head, thus making a small ad. as noticeable as a large one. The rate for this column is one cent a word, each insertion. Long Distance 'Phone, Canard, Kings Co., N. S.

TradeRelations of Canada and Jamaica

As briefly announced in yesterdays issue of the "Gleaner", Mr. E. B. Elderkin of Amherst, Nova Scotia, a representative of the Canadian Department of Agriculture particularly the Live Stock branch is now in this island having arrived by the Royal Mail steamer Sarstoon from St. Kitts.

Interviewed yesterday at Myrtle Bank Hotel by a "Gleaner" reporter Mr. Elderkin said. "My visit to the West Indies is for the purpose of discovering the possibilities of trade in live stock particularly blooded animals, between Canada and these islands. I left Canada in May this year and have visited Montserrat, St Lucia, St. Vincent, Barbados, Trinidad, Demerara, Dominica, Antigua, and St. Kitts. I came on to Jamaica from the last named place in the steamer Sarstoon and from here I go back to Canada.

"The climatic conditions of Canada are very favorable for the development of animals of constitutional vigor and consequently more able to resist climatic changes such as those that occur between the West India Islands and Canada. We produce all the leading breeds of beef cattle, dairy cattle, draft and carriage horses, best breeds of sheep and swine and all the utility breeds of poultry. Canada is wonderfully free from disease, and the animals are exceedingly healthy. The live stock branch, under the guidance of Dr. J. G. Rutherford, is making every effort to stimulate the breeders in Canada to produce the highest ideals in type of the various animals that they are breeding, and the effects of this education can be seen all over Canada to-day. Almost all the leading breeds of animals are bred in the Maritime provinces of Canada and being so close to the seaboard that the internal transportation of animals coming to the West Indies is very small. It is expected that in the near future increased transportation facilities will be provided, which should bring these West Indian islands and Canada in closer touch with each other.

"I have been exceedingly gratified with the reception I received in the places I have visited, both from the Government officials and private individuals, and the prospects of trade are good. The citizens of these islands realize that to keep up the strength of their herds and flocks it is necessary to import new blood in the way of sires, and they have expressed to me their intention of purchasing in the future in Canada. And there is no doubt that they can be supplied with quality equal to any other part of the world, and at prices plus expenses that will land them down here at less cost than they can be purchased elsewhere. I have been able to give the names of breeders in Canada of dairy cattle, beef cattle, sheep, swine, poultry of various kinds and horses, with whom they can correspond and who are absolutely reliable and have reputations for straight-forwardness to sustain.

"This morning I had the pleasure of meeting the Hon. H. H. Cousins, the Director of Agriculture, who very kindly showed me over the Hope Gardens and the animals he has at the Farm School. I am sure that your Government and colony are to be congratulated on having a gentleman occupying this important position who brings to bear upon it the enthusiasm of Mr. Cousins and a determination to make it a success. I judge that he has been liberally supported financially by the Government, and I am sure, from what he outlined to me of his intentions for the future that no money expended will give a larger return and do more for the up-building of the island.

"Through the kindness of the Administrator of St. Kitts, the Hon. T. L. Roxburgh, C. M. G., I have got letters of introduction to some of the pen-keepers here—gentleman at Mountpelier, Ochio Rios and Mount Plenty. On Monday or Tuesday I propose going up in those districts and spend the week there sailing from Port Antonio on Saturday 27th inst., in the Pickford and Black's steamer Amanda for Halifax, N. S.

"These islands," concluded Mr. Elderkin, "are the natural compliment of Canada. They produce that which Canada cannot, and Canada produces those things which these islands need. And with good transportation facilities there should be a large volume of business that would operate to the advantage of both. Each owing allegiance to one flag under which all our liberties are guaranteed, there should be a oneness of purpose to develop these over seas dominions so that they could take their proper place in this grand empire of which we are a part." — Gleaner, Kingston, Jamaica.

If any of your farm wagons need new wheels don't use wooden wheels again. Put on Dominion Low Wide-tire Steel Wheels They are cheaper, lighter and stronger than wooden wheels Guaranteed not to break in coldest weather or on rockiest roads. Wide tires save roads, and make pulling easier for horses. Will last a lifetime. Made to fit any axle. Pay for themselves first season.

The Dominion Handy Wagon saves half your labor and time in loading and unloading. Wide tire, low wheels save roads and horses. Parts are arranged for easy draft. Saves its own cost first season, like our Low, Wide-tired Steel Wheels. Write for free booklet.

Volume 15. Sussex, N. B., September 20, 1910. Number 24.

THE DOMINION EXHIBITION.

THE first exhibition, in the 1910 Maritime Province circuit of fall fairs, was held from the third to to the fifteenth of September, in the city of St. John, the winter port of New Brunswick.

The official opening took place in the large amusement hall over the transportation department, where a large audience assembled to hear the opening addresses, savoring so much of future bright prospects for the Winter Port city, by Hon. Wm. Pugsley, Sir Robert Peaks and others.

Despite the fact that the weatherman was not at all in a kindly mood and sent rather cold winds and clouds laden with rain on several days, the turnstiles clicked their merry tune from early morn until late at night when it was not uncommon to find, at the close of the day, when the grand totals were taken, that upwards of twenty thousand visitors had thronged through the main building, and out over the grounds and in and through the agricultural and transportation halls and poultry and live stock buildings.

Fakirs were there in abundance but one of the commendable arrangements in regard to this motely mass was that they were so placed that the visitor who did not wish to patronize them or listen to their jab ber need not go their way as they were placed to the extreme right of the grounds behind the grand stand building.

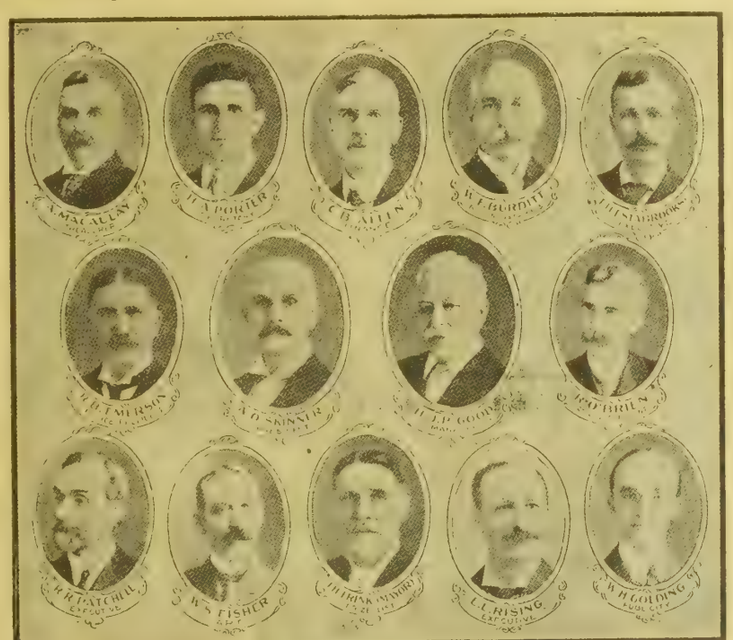
President Skinner, Manager Good, Secretary Porter, the various members of the office staff as well as the superintendents of the various departments and special police did everything in their power to make matters easy and pleasant for the various exhibitors without resorting to any unpleasant officiousness.

The judges did the work in their respective departments without partiality, fear or favor and although there was more or less dissatisfaction in regard to certain awards, they were only cases where the losing exhibitors could not see eye to eye with the judges and no one offered to remark that the judges were not conscientious in their work.

IN THE MAIN BUILDING

were found exhibits from many of the Maritime Provinces' most progressive manufacturers and dealers. The arrangements throughout was neat and attractive and a capable staff of attendants and assistants kept everything in ship shape.

With the exception of the interesting exhibit made by the British West Indies, which showed some of the resources of these wonderful islands, and a few minor exhibits, the display in the main building, in reality, was not representative of Canada's vast dominion. It was, however, a good representative of our Maritime industries. We would look for more exhibits in the manufacturers' lines from the sister provinces at a fair of such dimensions as the Dominion official exhibition.



The Men Who Made the 1910 Dominion Exhibition.

The educational exhibits in the Domestic Science and Manual Training departments as well as the ladies fancy and art work were much admired and showed that skill which the hand acquires when carefully trained. The work done by some of the boys and girls in our schools, as shown at St. John, would put to shame the work of some reputably clever mechanics. The Art Room was thronged with visitors who could not help admiring the excellent pictures and other works shown. Some of the pictures were of historic interest.

H. A. Lyman, St. John; Alfred F. Hiltz and E. L. Jarvis, St. John, had exhibits of cut flowers. The best collection was shown by A. E. Hiltz, Bridgetown, N. S.

IN THE TRANSPORTATION HALL.

Carriages, Automobiles, and Gasoline Engines were the principal exhibits.

THE NEW AGRICULTURAL HALL.

presented an interesting scene. S. L. Peters the veteran exhibitor of Queenstown, was in charge.

At the extreme rear was found a splendid display of the products of the Experimental Farm, Nappan. The products were artistically arranged and Mr. Robert, the genial son of the farm superintendent, was in charge to answer questions and give any desired information in regard to the various features of the exhibit.

The tables were heavily laden with the products of fields, farms, gardens and orchards. The quality of the various exhiqits was excellent. Roots, grains and vegetables were judged by Messrs. S. J. Moore, and J. C. Cote, Maritime and Quebec representatives, respectively, of the Seed Division, Ottawa.

COUNTY EXHIBITS OF FRUITS, GRAINS, VEGETABLES, ETC., had entries from Victoria, York, Kings, Albert, Charlotte and St. John Counties, and won awards in the order named. Donald Innis had charge of and grew most of the Vic. Co., first prize exhibit products.

The principal exhibitors of sheaf grain were, Donald Innis, Orin Hayes, F. E. Henderson, George W. Foster, Eben Scribner, A. R. Gorham and B. F. Chesley. The 1st award for best exhibit of sheaf grain as well as second award on grain went to Orin Hayes, Sussex. Donald Innis had the best collection of grain. In the class for Field Roots, Messrs. O. W. Wetmore, B. Goodspeed, F. B. Waters, L. B. Jordan, F. V. Hamm and Orin Hayes competed. The first honor for best collection went to B. Goodspeed, Penniac, N. B., closely followed by Orin Hayes in second place and B. F. Chesley, Clarence, N. S., came in for third award.

O. W. Wetmore, Clifton, N. B., had the best assortment of potatoes and B. Goodspeed and B. F. Chesley won second and third awards respectively.

In garden vegetables B. Goodspeed won the sweepstake prize for best collection and F. B. Waters, Loch Lomond, N. B., had the third place collection.

B. Goodspeed won the first prize for best exhibit of field roots and garden produce, and second prize for best exhibit of potatoes grown exclusively upon the fertilizers of the Provincial Chemical Co., St. John. In the latter classes, Orin Hayes and B. F. Chesley won second and third places respectively.

The Messrs. W. Altie Burpee & Co., seedmen, of Philadelphia, special prize of $20.00 for best and largest collection of vegetables grown from Burpee's seeds was won by B. Goodspeed.

O. W. Wetmore, B. Goodspeed and S. L. Peters won first, second and third places respectively, in the Bowker Fertilizer Company's specials for best collection of potatoes and roots grown on Bowker's fertilizers.

The Sussex High School and the Hampton Consolidated School were the only contestants in the School Garden Produce Class, and won first and second places in the order named. Both of these exhibits were very creditable and although five schools did not compete, we believe the schools should be encouraged in their good work by awarding them the full fifty dollars instead of the paltry sum of $10.00 and $5.00, which was won by the respective schools and which would hardly cover expenses, to say nothing of leaving a surplus for the purchasing of books on rural subjects for the school libraries. The prizes for the best display of products grown on the pupils' individual plots all went to pupils of the Hampton School.

THE FRUIT

was judged by George H. Vroom, the chief Inspector for Nova Scotia, of the Fruit Division, Ottawa. He found a lot of good, sound, clean, well matured and nicely colored fruit, which was a further assurance that New Brunswick can grow fruit. H. D. Johnson, B. F. Chesley, G. N. Banks and H. A. D'Almaine were over from Nova Scotia with a large assortment of varieties. Albert, Kings, Sunbury and Victoria coun-

ties were the only counties showing county collections of fruit. The sweepstakes prize collection was shown by S. L. Peters, Queens Co., who also won the Bank of Commerce special for best collection shown by a New Brunswick fruit grower. B. F. Chesley had the best collection from Nova Scotia.

S. L. Peters also won first award in the classes for best collection fruit in natural condition, and best collection small fruits shown in glass.

HONEY AND BEE SUPPLIES.

In this class, Wilfred Todd, Milltown, N. B., made a good display in the respective sections of the class and carried off practically all the awards. A demonstration in the handling of bees was given in a netted wire cage close to the above exhibit.

The New Brunswick Government had an exhibit of general interest to sportsmen. It contained specimens of salmon and trout in tanks, a family of live muskrats, a family of live beavers, a fox and a moose as well as stuffed specimens of the various species of wild animals and birds found in the province. There was also a log house which was very [illegible]onstructed. Close to this ex[illegible]s a display of minerals in[illegible] of the New Brunswick miner[illegible]arch.

HORSES.

The horses were stabled in the old box stalls on opposite sides of the new cattle, sheep and hog barns. There are a great many good horses in Canada but very few of them were shown at the Dominion fair. There were a few good ones but not enough of them to make the stranger within our gates enthusiastic over Canadian horse flesh.

THOROUGHBREDS were shown by Geo. W. Fowler, Sussex, N. B., and A. A. Laffie, St. Stephen, N. B.; Norman L. McLeod, St. John; Hartland Poultry Yards and The Canadian National Bureau of Breeding, Montreal. George W. Fowler's Waterlight, first as stallion, four years old and over, was champion stallion any age, followed in his class in second and third placed by Ostrich and Logan shown by the Canadian National Bureau of Breeding.

The Hartland Poultry Yards won on brood mare and foal, of 1910 [illegible] as on the progeny of Thor[illegible] mares imported from Ken[illegible] sold by the New Bruns[illegible]ament in 1909.

STANDARD BRED HORSES.— W. J. Alexander's Dan Gilbert, R. A. Snowball's Karaquilin, and Alexander Clark's Reps. de Monbells were up for honors in the aged Standard Bred Stallion class. The red, the blue and the white were placed in the order named. H. R. McMonagle won the first award on two-year-old filly, first on yearling filly and first and second on mares four years old and upwards, in harness.

Alexander Clark had the only brood mare with foal and foal of 1910. S. T. Lamb, Perry Point, N. B., won second prize in the two-year old filly class on Bonnie Jean.

HACKNEYS were few in numbers but the quality throughout the class was good. T. B. McAulay, Hudson Heights, Que., and R. A. Snowball, Chatham, N. B., were the only competitors. McAulay's Lucifer was the stallion shown in the four-year-old class and Model Performer, R. A. Snowball's three-year-old stallion had no competition in his class. In the one-year-old stallion class Snowball's Cock-o'-the-North won the coveted red from McAulay's Matthias II, which is quite an honor for the lusty youngster, as Mathias II. was never beaten before. McAulay's Lucifer carried off the diploma for best stallion, any age. Lucifer was sired by Copper King, champion at the English shows two years ago. His dam was by Goldfinder, a champion English mare. Mathias II. is a colt of wonderful action. He is of inbred breeding as both his sire and dam were the get of Matthias.

Snowball led the way in the yearling filly class with Langton Belle, in competition with McAulay's Royal Ophelia II. by Royal Ophilian out of Cymbal a daughter of the great Matthias.

McAulay's Ophelias Heiress, a daughter of Polonius, twice champion at Ottawa and Sherbrooke won both medals offered by the Canadian Hackney Horse Society for best mare any age and height, shown on the line and in harness with suitable vehicle.

Snowball's Langton Lilly was first in the brood mare with foal by her side class. Her foal by Model Performer was second in his class.

McAulay's first prize foal, by Lucifer out of Cymbal was consider by onlookers and the judges to be one of the sweetest foals on the grounds. He has wonderful action and conformation and will undoubtedly be heard from in show ring records.

Ophelia's Heiress and Ophelia's Fashion, two of McAulay's mares

Where the first St. John Exhibition was held
Compare with a cut of the present buildings which appeared in a recent issue.

were first in their respective classes for single actor or high stepper 15.2 hands or over and under 15.2 hands, as well as for matched pair high steppers.

CARRIAGE & COACH HORSES —W. J. Alexander, H. C. Jewett and W. H. Keys were up for honors in the aged stallion class with Onyx, Galloway and Danais respectively, and won in the order named. Onyx won the diploma for best stallion any age.

Hugh Payne, Hillsdale, N. B., had Romp Walks, the only stallion in the two-year-old class. R. T. Hawkes, Bartibogue, N. B., won first on brood mare and foal of 1910 without competition. DeB. Carritte, St. John, won first in the single carriage horse in harness as well as the silver cup donated by Mr. George McAvity lor the best carriage horse bred in New Brunswick.

ROADSTERS.—Orin Hayes, with Nellie F., and her foal by Buz Fuz, won first prizes, without competition in the classes for brood mares and foals of 1910. John F. Frost, Hampton, had the only entry in the three year old filly class.

CLYDESDALES.—The strongest competition in any one of the horse classes came into the ring when the Clydesdales put in an appearance and some horses of very good quality were shown. Mr. George Gray, Newcastle, Ontario, placed the awards in this class as well as in the other heavy horse classes. In the four-year old stallion class, T. B. McAulay's Lord Aberdeen, H. C. Jewett's Sorbie Boy, Logan Bros.' Handy Andy and H. R. McMonagle's Stanley faced the judges and received their awards in the above order.

The battle royal in the three year old stallion class was between R. A. Snowball's Brown Balgredden, Treadwell-Hoben Co's. Provost Wright and H. R. McMonagle's Royal Baron's Pride. The awards were placed respectively as named.

H. C. Jewett's Scottie Baldwin by Sorbie Boy was the only stallion in the two-year-old class.

Logan Bros.' Labari Again was first without competition in the yearling stallion class.

Winsome Bessie, an imported mare, shown by John B. Barton, Welsford, N. B., had no competition in the three-year-old filly class.

Logan Bros. had two mares in the two-year-old filly class and won first and second prizes over C. P. Blanchard's Woodburn Marchioness by Montrieffe Marcus.

Logan Bros. with Rose of Homestead had no competition in the one-year-old filly class.

R. A. Snowball's May Lothian and Marinetta won first and third places respectively on brood mare with foal by their side. While Logan Bros.' Soubrette won second award.

Logan Bros. had the first and third prize winners in foals of 1910, and R. A. Snowball had the second place winner.

Snowball's May Lothian captured the coveted honor of Diploma for best mare any age, for best Clydesdale female, any age, bred in Canada and with her mate Martinetta, won first for pair of Clyde mares. Logan Bros. were close competitors in the latter class.

Baron Belgredden the first prize three-year-old stallion received the Clydesdale Association of Canada's sp?cial prize for stallion any age.

PERCHERON. — Mathurin, Glaneur, and Seapin, shown by W. H. Fowler, St. John, Jamieson & Walker, Sussex Corner and D. W. McKenzie in the aged Percheron stallion class won the red, blue and white ribbons in the order named. The former winning diploma for stallion any age. Chas. Symes, Minudie, N. S., had no competition with his one-year-old stallion, Lord Roberts, as well as first prize with Distinguee, on Filly, 3-years-old or over.

Geo. F. Mayes, St. John and Geo. Chamberlain, St. John, had the only entries in the brood mare and foal of 1910 classes.

GENERAL PURPOSE.— Jas. Barrett & Sons, Crouchville, captured the Silver Cup presented by the Bank of New Brunswick for the best general purpose or agricultural horse in the Mariti e Provinces, weighing between 1250 pounds and 1500 pounds.

COMMERCIAL.—The Commercial class, particularly the section for heavy express or general delivery, was a mixed multitude containing quite a number of horses that rightly belonged to the lighter class of express horses. James Pender won the first prize on an outstanding winner followed by two Dominion Express horses in second and third places.

In the lighter class of express or delivery horses, Geo. B. Taylor, St. John, and F. E. Williams, respectively won first and second places.

The light horse classes were judged by Dr. J. S. Standish, Truro, N. S., in his usual efficient manner, while George Gray, Newcastle, Ontario, distributed the honors in the heavier classes.

BEEF CATTLE.

The beef breeds were few in point of numbers but many of them were of excellent quality. Visitors to St. John fairs, on previous occasions, have had an opportunity to review more and fully as good individuals as were shown this year. Several breeders that have been showing in former years were conspicuous by their absence and it looks as though W. W. Black with his Herefords and Messers. C. A. Archibald and Snowball with their Shorthorns are the only Maritime breeders who are interested enough in the breeding of beef cattle to bring their stock to the Dominion Fair where the public could see their excellent stock.

We do not know why beef breeds were not represented by Ontario and Quebec breeders. Perhaps the prize list was not heavy enough or perhaps inducements in the form of an offer to equalize freight rates up to a certain distance was not held out to them. Anyway, they did not come and they were missed.

HEREFORDS.—W. W. Black had the only herd of Herefords and needless to say they were out in their usual good form. The champion male was the aged bull, Rupert 4th of Ingleside, and the champion female was the two-year-old heifer, Sylvan of Amherst.

SHORTHORNS.—The battle royal in Shorthorns was waged between the Snowball and Archibald herds. The Snowball herd was represented by nine good individuals, four of which were calves. Archibald won the Senior and Grand Championships on bulls with Orange Prince, shown in the three-year-old section. Orange Prince was bred by Hon. W. C. Edwards, of Ontario. All the female championships went to the Archibald herd as follows:—Senior and Grand Champion female, Merrymaid; Junior and Reserve Grand Champion female, Mermaid, a grand-daughter of old Merrymaid. Another Merrymaid calf came in for Junior Reserve Champion female. The first

prize on aged herd and on young herd as well as first and third awards for cow and two of her progeny went to the Archibgld herd; the latter on Merrymaid III., granddaughter of the original Merrymaid. It is worthy of note that at the time of the first fat stock show in Amherst, the original Merrymaid, although only a calf, won the championship, in her class, which elicited some criticism of Prof. Day's judgment in placing her first. Her winnings at subsequent shows as well as the standard of excellence in uniform good qualities of her progeny has more than proved Prof. Day's good judgment, a judgment which in this case was one of which he need not be ashamed.

The Snowball herd carried off the palm for Junior Champion and Grand Reserve male with Scottish Clipper and junior reserve champion male with Chatham Clipper shown in the senior yearling and calf classes respectively. Both the Archibald and Snowball herds were out in good fit and the winnings of the respective herds will be found in the published list of awards on another page.

The Silver Cup, for best Shorthorn bull in the Maritime Provinces went to Archibald's Orange Prince. It is regretted that some of the Western breeders did not see their way clear to exhibit at St. John. Every year thousands of dollars go from the Maritime Provinces to the Western Provinces and we would like to see farmers who are so situated as to be able to carry on the beef raising industry, stimulated to better efforts towards capturing some of the money that we now, through necessity, send to our brother farmers in the West, in order to supply the demand for good beef.

BEEF GRADES.—W. W. Black, Amherst, had everything his own way in the beef grade class, with a nice uniform lot of Hereford grades. Wm. Robertson, Amherst, was his only competitor, the latter winning second place on Cow, 4-years-old and upwards, with a grade Shorthorn.

FAT CATTLE were few in numbers. There again W. W. Black carried off all the most valuable awards. John McDonald, Jr., St. John, showed a few Shorthorn steers but their quality did not come up to that of the Herefords so they had to take some of the inferior awards.

DAIRY BREEDS.

The unaminous verdict of all those who visited the show ring and the cattle barn at St. John was that the dairy cattle section was the strongest point of the show. There were active, attractive looking Ayrshires, some beautiful Holsteins, Jerseys in abundance and two herds of Guernseys.

In the dairy classes, the magnificient herd of Ayrshires and the splendid herd of Jerseys shown respectively by P. D. McArthur, North Georgetown, Que., and B. H. Bull & Sons, Brampton, Ontario, saved the situation from being a purely Maritime show.

While there are not a great many French Canadian cattle in the Maritime Provinces, there are a great many herds of this useful breed in the neighboring province of Quebec, and it is regretable to think that the management of any Canadian Dominion Exhibition should be so short sighted as not to provide a place for the only practically breed of cattle, native to Canada, in their prize list. This was a short sightedness for which there is no excuse and we feel confident that had there been a place for French Canadian cattle a creditable showing would have been made.

The new stables are conveniently arranged and are so arranged that one can see every animal in the building. There is a good watering system and a number of litter carriers are provided which make the work of keeping the stables clean a fairly easy matter.

AYRSHIRES were strong in numbers and in point of quality. McIntyre Bros., Sussex, N. B.; M. H. Parlee, Lower Millstream, N. B.; Retson Bros., Truro, N. S., and C. P. Blanchard, Truro, N. S.; James Barrett & Sons, Crouchville, N. B.; S. Creighton, Silver Falls, N. B., and Chas. Symes, Minudie, N. S., were out with their best, which means that go where you will in Canada, you will not find better quality. Six aged bulls faced the judge, W. W. Ballentyne, Stratford, Ontario, and they were all good ones. The coveted red as well as Senior and Grand Championships went to P. D. McArthur's Netherall Milkman, a champion at Ottawa in 1909 and at Sherbrooke in 1910. He also was first with three of his get, Cherrybank Milkmaid, Cherry Bank Cicero and Cherry Bank Queen, thus repeating his Sherbrooke winnings. The first prize for Senior Bull Calf went to McArthur's Sir Walter. The third prize junior bull calf shown by McArthur, remains in the Maritime Provinces having been purchased by S. Creighton, Silver Falls, N. B. This young bull carries his sires depth and top line and should prove a good stock getter.

The other winnings of the McArthur herd were on such cows as Amaryllis of the Willows in the dry, four-year-old class, Prim of the Willows in the three-year-old class, Luna of Cherry Bank and Cherry Bank Jean in the two-year-old cow class and Carolina of the Willows in the two year heifer class. Cherry Bank Milkmaid, a senior yearling heifer and daughter of the champion bull was junior champion and reserve grand champion female. At Sherbrooke she captured the grand championship.

Little Gem of Elm Shade with her daughters Cherry Bank Jean and Cherry Bank Queen, first in the cow and two of her progeny class at Sherbrooke, again won the same honor at St. John. Little Gem of Elm Shade put up a very creditable showing although milking since last December. During the first three and one-half months of her last lactation period she gave 4042 pounds of milk testing 4.1 per cent. butterfat. Come again McArthur.

M. H. Parlee, Millstream, had his Maple Grove Herd out in full force. Lord Dudley of Spruce Grove, the veteran winner was found, when judgment was delivered, next to the red ribbon winner in his class. Despite his age Dudley shows up well and looks good enough for many more years of useful service and was given the senior reserve championship. The junior reserve male championship also went to the Parlee herd on Morton Main's Amanth, a spicy junior yearling. Culcaigrie Hilda, a typical Ayrshire carrying a good udder waltzed to the head of the class in the aged cow class and carried off the senior and grand female championships. The fattest plum for Canadian bred cow, three years or upwards went to Parlee's Grace Darling of Spruce Grove. The third prize for aged herd, the second prize for breeders' young herd and the third prize for bull and three of his get, as well as second prize for cow and two of her offspring were other important winnings by the Maple Grove Herd.

Retson Bros. were over from Truro with a lot of useful Ayrshires. They showed a particularly nice two-year-old cow, although she is perhaps a little under size which may be accounted for by the fact that although so young a cow she is in her second lactation period. She carries a very large udder for her size. She was shown late in the afternoon and her udder being so full did not help her show to the best advantage. She pushed hard for first honors but had to take second place.

C. P. Blanchard, a young breeder of Truro, made his debut at St. John, with an excellent lot of Ayrshires that are a credit to one so young in the business. He has already made one importation from Scotland and will be heard from at future shows. His herd is headed by Special Spice, an imported bull out of Howie's Champion bull, Spicy Sam, one of the best breeding bulls in Scotland. Blanchard led the way in the three-year-old cow class, with Sunnyside Spot, a Canadian bred cow and an outstanding winner in her class. In the dry three-year-old class Blanchard was again an easy first with Borrowmoss Moss Rose IV., imported recently from Scotland. Another Blanchard imported senior yearling heifer, Howies Bright Lady II., was second in her class and junior reserve champion. Chas. Symes, had the third prize two-year-old cow. S. Creighton, Silver Falls, had the third prize aged cow, the third prize Canadian bred cow and the fourth senior yearling heifer. He has purchased a new herd header and he will be out stronger than ever when the next St. John exhibition takes place.

James Barrett & Sons, proprietors of Hill Grove Stock Farm, Crouchville, N. B., were out in full bloom with twenty typical head of Ayrshire cattle. Their herd is headed by Cherry Bank Sunrise, who won first in the two year old class and is a son of the unbeaten champion of America, Barcheskie Kings Own (Imp.) that is known to Ayrshire breeders throughout the world. They won 2nd place in the three-year-old class in milk on Scottie of Stockwood, a grand young cow whose dam won 1st at Ottawa last year for the best Canadian bred cow, she also won 2nd for the best Canadian bred cow, following in the footsteps of her mother. They won 2nd place in the dry three-year-old class on Pearl of Silver Falls, a cow of splendid Ayrshire type and has proven to be a heavy producer. In the junior yearling class they won 2nd on Lady Marguerite of Hill Grove, a very promising young heifer; 2nd in the senior calf class on Hill Grove Dairy Maid, a very strong calf. They won 4th in the senior bull class on Hill Grove Pearlstone, a grand young bull of the deepest milking strains, which ought to be a great stock getter. They also won third place for the breeders' young herd which was headed by Pearlstone. Messrs. Barrett have been breeding Ayrshire cattle for the past few years and the result of their creditable showing in the ring goes to show that they have in their herd animals to breed from fit to win in competition. Owing to their extensive milk route in St. John they will be unable to take in the fall shows as they require their milk to supply their city trade. The Hill Grove herd were winners in every class in which they had entries.

McIntyre Bros., were out with their magnificent string of producers. Although their aged bull, Whitehill Sunrise went down to third place in his class he, with three of his get, gave the winner of the red ribbon a run for his money, and was good enough to head the first prize aged herd when backed up by such grand females as White Lady, Morton Main's Lady Nelly, Orange Lily and Rose of Spring Brook. McIntyre Bros. imported, junior yearling bull was first in his class, junior champion and grand reserve champion as well as the head of the first prize breeders' young herd. In the class for cow and two of her progeny McIntyre Bros., White Lady, the senior reserve champion female carried off first honors. The Silver Medal donated by the Bank of Commerce, St. John, N. B., for the best herd of dairy cattle consisting of four females, over two years old was captured by McIntyre Bros.' herd. In winning both the herd prizes McIntyre Bros. show that they have a class of Ayrshires that are so uniform in quality that it takes some competiton to get ahead of them.

For the other winnings of the respective herds the readers may look over the list of awards on another page.

Guernseys.—Owing to a discrimination against Guernseys, in the amount of money offered in their class, and which the additional paltry amount subsequently added did not satisfactorily rectify all the Guernsey breeders with the exception of Roper Bros., and James Roper & Sons, Charlottetown, refrained from showing. Why not put the Guernseys on an equal footing with other breeds at Dominion exhibitions and particularly so when it is held in the Maritime Provinces, the Guernsey stronghold of and the seat of the Guernsey Association in Canada?

All the championships with the exception of junior reserve championship went to Roper Bros. Both these herds were out in a creditable condition and good enough to demonstrate that they were just as well entitled to a full prize list as any other dairy herd. H. G. Clark, Georgetown, Ontario, placed the awards.

JERSEYS.—Robert Robinson, Sussex, N. B., H. S. Pipes & Son, Amherst, N. S.; Josselyn & Young, Silver Falls, N. B., and James E. Baker & Sons, had their best stock at St. John to lock horns with B. H. Bull & Son, Brampton, Ontario.

Despite the good quality of the Maritime herds, the Ontario herd made matters lively for them and carried off a great many of coveted first prizes.

Mr. H. G. Clark placed the awards.

The Brampton herd carried off all the male championships with the exception of that on junior reserve champion male which went to H. S. Pipes & Son, on Chief Financier, a senior yearling calf. In the female class again won all the championships with the exception of senior reserve and grand reserve championships which both went to H. S. Pipes & Sons on Babbit, a daughter af Brampton Financier, a cow of strong constitution and ideal udder shown in the two-year-old cow class. Eminent Raleigh the head of the Brampton herd and first in the aged bull class was senior and grand champion male and is the son of Mabel's Raleigh, the sire of long distance test cows. His dam was by Eminent II, a $10,000 bull. Pipes & Sons won second and third places respectively in the aged bull class on Imported Fereor and Brampton Financier. Fox Hall St. John O' Dreamwold owned by Josselyn & Young came in for fourth money, Brampton Champion in the hands of S. Creighton, got filth award.

Robert Robinson, with Fontaine of Meadowview and Bonnie's Foxy, the former champion at Fredericton last year, won second and third places respectively in competition with Bull & Sons' Tolstoi, in the two-year-old bull class. In the junior yearling bull class, Bull & Sons had the only entry. They showed Brampton Phra, the winner of the junior championship. He was grand champion at Sherbrooke, where Judge Weyman said he was the best Jersey bull he had ever seen. Bull led the way in the senior yearling bull class, followed in second, third and fourth places by J. E. Baker & Sons. Robert Robinson with Cromo's Merry Prince and H. S. Pipes & Sons. H.

S. Pipes & Sons won the red ribbon in both the calf classes.

In the aged cow class, Bull & Son again led the way with Brampton Blossom, a sister to the champion bull, a cow carrying an ideal udder with nicely placed teats and of true Jersey type. She was followed closely in second place by Gladys, a strong typical cow, shown by Josselyn & Young, and in third place by Robinson's Hood Farm Bonnie, a cow of good capacity and strong constitution, carrying an almost abnormally heavy udder. Bull's Miss Napoleon, a cow of wonderful capacity and grand champion at Sherbrooke, although showing under the ntage of being twelve months in milk, stood in fourth place.

It was from the dry four-year-old class that the senior and grand onships were taken, having been captured by Bull's Brampton Eminent Gidder, an outstanding daughter of Eminent II. out of Jenbie Gidder, at one time the holder of the Island butter record. Forfarshire's Fair Lady, a cow imported from Dreamwold Farm by Josselyn & Young, was second in the dry aged cow class, while Pipes & Son, third money.

e three-year-old cow class, n & Young held first and place, the former with Flying Dora, a cow of Dreamwold breeding, carrying a fine udder and possessing a particularly strong constitution. Bull's Stockwell Girl won third place in this class.

In the dry three-year-old cow class, R. Robinson mounted to the front with Figgis of Meadow View, which was first as a yearling at Halifax in 1908. Josselyn & Young and B. H. Bull & Sons had the second and third prize winners in this section.

The class for Canadian bred cows saw Josselyn & Young at the head of the class, with Pius Judy. Robinson's Lady of Meadow View stood in second place and Gypsy Girl, one of the Brampton cows occupied third base.

H. S. Pipes & Sons, B. H. Bull & Son, Josselyn & Young and Jas. E. Baker & Sons, won in the order named in the two-year-old cow class. Babbit, the cow shown by H. S. Pipes & Son in this class, is a daughter of Brampton Financier. She the reserve senior and reserve championships on her strong titution, her dairy conformation her ideal udder. Bull & Sons showed Brampton Fontaine Rose, first over all breeds in dairy test at the Sherbrooke exhibition. Josselyn & Young's cow is a daughter of their aged bull Hood Farm Pogus 40th.

Bull & Son led the way in the two-year-old heifer class with Brampton Ferrier Maid, a daughter of Brampton Ferrier, and was followed in second and third places by Josselyn & Young with two strong heifers.

In the senior yearling heifer class, Bull & Son's Brampton Mermaid, a daughter of their first prize aged cow, won the red ribbon and was given the diploma for junior female champion. Although she is only twenty-two months old she is milking and gives indications of being an out and out dairy cow. The verdict of the Jersey men was that she was the sweetest heifer on the grounds. A choice heifer by Blue Blood, shown by H. S. Pipes & Sons, won second place in this class closely followed by R. Robinson with Roxana's Image. Wm. Mullin, St. John, had the fourth prize winner.

Josselyn & Young carried off the palm in the junior heifer class with Molly of Rose Bank.

In senior calves, the Brampton herd led the way with Brampton Lil, a daughter of the champion bull. Brampton Lil also carried off the junior championship. H. S. Pipes & Son carried off the blue and white ribbons on daughters of Brampton Financier. Bull & Son again led the way in the junior calf class with a milky type heifer, followed in second place by H. S. Pipes & Son, with a popular Blue Blood. Bull, Josselyn & Young and Pipes, won in their respective order on aged herds. In young herds Bull led the way with a uniform herd, headed by their junior champion bull, closely followed by H. S. Pipes & Son in second and third places.

Brampton Financier, H. S. Pipes & Son's aged bull, had the honor of gaining the most coveted prize for bull and three of his get.

Josselyn & Young's Judy and R. Robinson's Hood Farm Bonnie, captured first and second places respectively, for cow and two of her progeny. For full list of awards see prize list on another page.

HOLSTEINS.—Samuel Dickie & Sons, Truro, N. S.; Logan Bros., Amherst Point, N. S.; Harding Bros. Welsford, N. B., and Lea & Clark, Victoria, P. E. I., were in battle array at St. John, with the very best of their black and whites. We would have liked to see some competition from Western breeders for our boys think they can beat them in the show ring, in fact Logan Bros. have already met the Western breeders and have come away victorious.

W. W. Ballentyne, Stratford, Ont., placed the awards in this class.

Sir Rooker Posch Artis, Samuel Dickie & Sons' aged bull, led his class and carried off the senior championship and reserve grand championship, closely followed in second place in the former class by Logan's Mercena Vale.

In the two-year-old bull class, Logan led the way with Laddie, the winner of the reserve senior male championship, Harding Bros., were second in this class with Piet's Jacoba's Gay Lad, while Samuel Dickie & Sons, were third with Helbon DeKol's Prince. Lea & Clark's bull Victor of Fair Mede stood in fourth place.

Lea & Clark led the senior yearling bull class and had the only junior yearling bull on the grounds. They were successful in capturing the junior championship and grand championship diplomas with Bob Dorinda, a typical Holstein youngster of great promise. He will stand future watching.

The junior reserve championship diploma was captured by Logan Bros.' Dick. Logan Bros. also captured first and third awards on senior bull calves and second on junior bull calf. The other awards in the bull calf classes went to Lea & Clark.

In the female classes, Logan Bros. won first and senior and grand championships on cow, four-years-old, or over, with an imported cow, Piet 6th, and in the section for dry cows, four-years-old, they carried off the blue ribbon with Princess Lida Posch. Their Artes Juba Oatka was first in the three-year-old cow class. In the dry three-year-old class Logan Bros. won first prize on Lady Mary Rooker and in the class for Canadian bred cows their Minnie Rooker's Poem, a Toronto, Sherbrooke and Maritime Fairs champion carried off the coveted prize and senior reserve and grand reserve championships. Logan Bros. also won second and third prizes in classes for yearling heifers and junior heifer calves, as well as first, third and fourth awards on senior heifer calves. Their aged herd led the way and they also captured the first and third breeders' young herd prizes as well as second prize on bull and three of his get.

Blanche Lahonda captured the third prize in the aged cow class for her owners, Samuel Dickie & Sons. In the two-year-old cow class, Samuel Dickie & Sons' Countess Lahonda a strong milky youngster, carried off the red ribbon, and her mates, Iosco Posch and Artis Rosie carried off first and second prizes respectively, in the two-year-old heifer class. Dickie & Sons also captured first money on junior yearling heifer with Cobiquid Orne Belle, second money on aged herd, first on bull and three of his get with their aged bull and three first prize heifers.

Harding Bros. captured the second prize on senior yearling bull with Sir Mercena Faforit Lad, Logan Bros. carrying off third money on Van Voran Vale. The third prize on Canadian bred cow went to Harding Bros. on Faforit 7th's Beauty. Third place in the three-year-old cow class went to Harding's Minnie's Queen. Harding also had the fourth prize senior yearling heifer and junior heifer calf; 4th on breeders' young herd, and third on bull and three of his get.

Lea & Clark are practically strangers in mainland show rings, but they have quite an enviable record in Island show circles. Besides their winnings in the bull classes they captured many choice morsels in the female classes. Their Jacoba Johanna, was second in the aged cow class. They led the way in the dry cow class with Jacoba Emily. Their Johanna Mercides Posch won second place in the dry three-year-old class, and their Mary Rooker II. was second in the Canadian bred class as was their Wilhelmina Van Voran in the two-year-old cow class. They led the junior yearling heifer class with Aaggie Van Voran DeKol; second in the senior heifer class. They had in the junior heifer class. They had the third prize aged herd, second prize young herd and first cow with two of her progeny as well as junior champion female. Samuel Dickie's Cobequid Orne Belle was junior reserve grand champion.

The demand for Holsteins has become so heavy that it is almost impossible to buy females from any of these breeders. A full carload was purchased, at the fair at big prices, by Herbert Logan, who left with them for New Westminster, B. C., immediately after the Dominion fair.

...DAIRY GRADES.—There were some exce,lent grade dairy cattle shown. McIntyre Bros., had a strong string of Ayrshire grades and one Holstein grade that was good enough to carry off the Holstein Breeders' Association Cup, for the the best dairy grade cow, any age. Lea & Clark showed some splendid Holstein grades and Wm. Robertson, Amherst, showed a nice senior yearling grade Ayrshire heifer.

For the winnings in this useful class see the list of awards on another page.

IN THE SHEEP PENS.

The sheep exhibit was by no means up to that of other years in point of numbers. There was very little competition and it was a case of a walk over for the breeders in their respective classes.

C. M. McRae, Ottawa, placed the awards.

We would like to have seen a larger representation of the "golden hoof." We have seen better in other years. Owing to the fact that the Dominion clashed dates with Toronto and Ottawa fairs and the small inducement in the way of prizes, breeders from the sister provinces of Quebec and Ontario did not see their way clear to come to St. John with their flocks. There should have been more money offered in these important classes and there should have been less difference between the amount of awards in first, second, and third places. The drop from first to second and from second to third was too abrupt.

Then many of our local breeders whose sheep are recorded in the American records did not thing it worth while, for the small amount offered in prizes, to change over to the National Live Stock Records and consequently they were debared from showing. The American records have just a high a standing as the National and consequently so far as exhibitions are concerned they should be and are recognized. St. John, however, to the contrary. It would be well for our breeders to record their flock and herds as soon as possible in the National Live Stock Records of Canada.

COTSWOLDS.—H. W. Corning had a magnificient flock of Cotswolds in the pink of condition and easily won every first prize in the class over a flock shown by Donald Innis, with the exception of the red ribbon for shearling ram which went to the latter flock.

OXFORD DOWNS.—James E. Baker & Sons, Barronsfield, N. S., and Chas. Symes, Minudie, N. S., had their flocks and real good ones they were, up in their class. Most of the first and second prizes went to the Baker flock.

SHROPSHIRES.—There was no competition in the Shropshire class. All the prizes were captured by Cephas Munn, Winslow Road, P. E. I.

SOUTHDOWNS were shown by Jas. E. Baker & Sons and Cephas Nunn. The Nunn flock captured all the red ribbons with the exception of the first on shearling ewe which went to the Baker flock. The Southdowns throughout their respective sections were a nice, well finished, uniform lot.

HAMPSHIRES.—Cephas Nunn and his son, Oliver Nunn, had everything their own way with two flocks of Hampshires.

CHEVIOTS.—Chas. Symes and George Symes, Minudie, N. S., had everything their own way in this trappy class. J. E. McAuley, Lower Millstream, N. B., showed two very nice rams in the aged class on which he captured second and third prizes.

DORSETS were shown by Emerson F. Savant, Overton, N. S., a promising young breeder, who is out this year for the first time. We welcome him to the field. He won in every case except in the ram lamb section over his only competitor Cephas Nunn, who has added a flock of Dorsets to his other good flocks of Hampshires, Southdowns and Shropshires.

FAT SHEEP.—J. E. Baker & Sons had everything their own way in the fat sheep class, excepting second place for wether lamb, which went to H. W. Corning.

SWINE

ged by C. M. McRae, Ottawa. It was an easy task as there was no competition. James E. Baker & Sons had their Duroec Jerseys out in good form and Charles Symes, Minudie, N. S., was there with his Poland Chinas. These were the only two breeds represented, despite the fact that pork has been soaring away up during the last year. When one of Baker's Duroec Jerseys saw the small number of swine exhibited she did her best to add to the numbers and make a better exhibit by giving birth to eleven sturdy porkers, next day after her arrival.

POULTRY-

One of the real features of the Dominion exhibition was the poultry exhibit in the new poultry house. The poultry show was the largest ever held in Eastern Canada, both in number of entries and varieties of breeds. Almost every variety in the Standard was represented.

The American varieties surpassed all others, both in numbers and in quality, followed by the Mediterranean varieties. It is an established fact that these two breeds of poultry represented by their numerous varieties are a long way in the lead

(Continued on page 751.)

The Modern Power

Apropos the recent developments in Moncton oil fields. it may not be amiss to state a few facts concerning petroleum and what this industry means to New Brunswick.

When it is stated that the annual yield of petroleum in the United States exceeds eight billion gallons and that this is but a fraction of the world's yield, one may gain some impression of the magnitude of this great industry, of this colossal source of revenue, and its place in modern commerce.

The oil found at Moncton is of a fine quality, testing at 40 Beaume, and the development of this industry, which is sure to follow, argues well for the future of this Province. Districts where oil has been struck in the past have invariably blossomed forth in wealth. There are districts in the southwest where Indians are millionaires; fortunes acquired in royalties paid on oil wells struck on their reservations. It is a resource quickly and cheaply developed, and, once sunk, these wells spout forth wealth day after day from apparently inexhaustible reservoirs in the bowels of the earth.

Of all the servants of mankind, none are of greater utility than this great petroleum family, and particularly the principal member, gasoline; every motor car, every motor boat, every airship, every gasoline torch—from the plumber's to the wonderful little device used in the dentist's laboratory, and some of the most modern systems of illuminating, all stand monuments to gasoline, not to mention the other members of this great family, such as kerosene, paraffin, vaseline, lubricating oils and hundreds of other products in daily use.

The story of oil would make a lengthy romance. Space will not permit of here giving in detail the interesting process by which these products are obtained, nor the manifold uses to which they are put. The various products are distilled from the crude petroleum by means of heating it and drawing them off at different temperatures. It is in respect to gasoline that some of the more useful phases of petroleum lie. In the United States there are distilled annually over 200 million gallons of gasoline, half of which is used by automobiles. In the light of modern appliances, and owing to the fact that its growing use is causing the public to become on more and more familiar terms with gasoline, the old prejudices against this fuel are fast disappearing, and the usefulness of the product is becoming better known. This liquid possesses many advantages over solid fuel; (1) Cheapness and efficiency; (2) compactness; (3) lack of carbonizing; (4) lack of waste. As to the first, one gallon will develop 8 h. p. an hour, or as an illuminant will develop 2000 candlepower for fourteen hours when burned in mantles. (2) Compactness is the feature that makes gasoline the essential factor in the development of so many of our modern appliances, which would be impossible without it. (3) In the engine it is practically non-carbonizing, and in the new lighting systems it gives no smoke, being entirely consumed at the burner. (4) This feature is one of the chief advantages of gasoline, their being neither ash or residue and a consequential economy.

Those who handle gasoline and are familiar with it do not fear it. The man who rides daily with several gallons under his seat would smile at the old idea that it was the equivalent to as much dynamite. The old expression, "gasoline explosion," is a misnomer, and few people have ever witnessed such a thing. Gasoline will burn when in the air, but to explode it three things are necessary: (1) Mixture with 11 parts air; (2) compression; (3) ignition under these conditions. So an explosion as with gunpowder is impossible, as gasoline cannot explode when air is excluded; it requires vapor, air and compression with ignition, while gun powder gives its effect only when confined away from the air.—The Busy East.

Andrew Elliott's Report as Delegate to N. B. Summer Meetings.

To Hon. D. V. Landry, Commissioner for Agriculture:

In presenting to you my report of work done June 13 to July 23, 1910, allow me to acknowledge the completeness of preliminary work. I found that the meetings had been well advertised and arrangements for meetings placed in careful hands. I am pleased also to note that quite a number of members of the legislature attended meetings and gave addresses, among whom were Premier Hazen, Dr. Landry, Commissioner for Agriculture, Mr. Dixon, of Hillsboro; Mr. Woods, of Welsford, and a number of others whose names or addresses I did not catch. One thing particularly pleasing to me was the fact that not once was there the remotest hint as to the political alignment of the persons who spoke. all alike expressing their appreciation of the importance of a better agriculture throughout the province.

To me these meetings have been particularly encouraging. They were well attended by an enquiring people and I am hopeful that the foundation is being firmly laid for a general uplift of the agriculture of the province. Perhaps by no means can this be done so effectively as by bringing before the people—all the people—at all times, the tremendous importance of the soil as the only foundation of Provincial and Canadian greatness. Compared with the soil every other avenue of wealth sinks into insignificance.

From my observation, I think that the best time to hold these meetings is during the summer between seed time and haying.

If I may be allowed to suggest, I think it would be a move in the right direction to have a woman delegate along to give separate talks to the women during the afternoon and address the women during the afternoon and address joint meetings in the evening.

I have to acknowledge the valuable assistance I received from Mr. John Woods, of Welsford, who was with me for six days, also from Rev. J. B. Daggett, with whom I went to Deer, Campbello and Grand Manan Islands.

At most of the places visited meetings were held. 37 meetings were held at 29 different points. 99 different addresses were given and there was a total attendance of 3857 people, an average attendance at each place of 133 and at each meeting of 82 persons. Everywhere I met carefully attentive people.

Again thanking you for your arrangements, which did so much to make my work a pleasure, I remain,

Yours respectfully,
ANDREW ELLIOTT.

Home Butchering.

By dividing the time of killing into several periods, fresh meat can be provided from October until March or April. Early winter, that is, in December or January, is probably the best time for butchering the animals that are to provide the year's meat supply, as the meat then has plenty of time for curing before warm weather.

When hogs are to be killed have everything in readiness the evening before. The knives can be sharpened the fuel and kettles for heating the water in place and everything needed for scraping and hanging the carcasses at hand. Most farmers like to start operations on butchering day early in the morning, so as to get as near done in one day as possible.

Killing the hogs by shooting is about the best method. All excitement incident to some methods of killing is avoided when a rifle is used, and this insures a free discharge of blood. In sticking the hog a keen-edged, medium-sized knife should be used, running the knife straight in directly in front of the breast bone, so as to sever one of the jugular veins. Care should be taken to not penetrate the shoulder, as this will leave a blood clot there and largely destroy its value.

After sticking the pig wait until life is entirely extinct before beginning to scald. The water should be at the proper temperature, neither too hot nor too cold, or the bristles will not come off properly. A too hot scald sets the hair and makes the skin tender. By bringing the water to the boiling point and then removing to a cold barrel the temperature will be about right. A shovelful of wood ashes put into the water will help to loosen the scurf on the body of the hog. Test the scald often by pulling the hair.

After the hair is removed from the hog, the carcass should then be washed by dashing on hot water, then scraping to remove all scurf, finally rinsing with cold water. Then hang the hog upon the gallows by placing the ends of the gambrel through the ham strings. The entrails can then be removed. Let the meat cáill thoroughly then take them down and cut up. When cutting lay the hog on its back and cut the head off just back of the ears and jowl. Then divide the body of the hog from front to rear, along the backbone. Remove the leaf lard, ribs and backbone, and then cut out the hams and shoulders, cutting off the feet and then the hocks. Trim the hams and shoulders close and smooth.

Cut the head in two and remove the brains and eyes. Cut off the ears and end of the nose. Place the head and all bloody pieces of trimmings in a vessel of water to soak out the blood. The head and feet may then be scraped and cleaned, to be used later for head cheese or pickled.

In rendering the lard put the leaf fat in the kettles first and stir until it renders out some grease, then add the fat and complete the rendering. Don't have any water about the lard while rendering. When the meat is cold it may then be salted down.

The small intestines may be used for stuffing the sausage. If it is desired to keep any of the sausage until warm weather fry until a nice brown color, then place in jars, cover with its own fat, or melted lard if there is not enough of the sausage fat, and seal.—Successful Farming.

Salt for Mangolds

That applications of salt in addition to other fertilizers is useful for the mangold crop is generally acknowledged, but what is the most suitable quantity to apply is a question upon which there is considerable difference of opinion.

To obtain definite information on this point, the Harper-Adams Agricultural College have been conducting experiments for three years with quantities per acre of 2½ cwt., 5 cwt. 10 cwt., and 15 cwt. respectively.

The salt was applied in the middle of April and thoroughly worked into the soil by cultivating, harrowing, and rolling three times before rowing up, the ridges being again split before sowing.

Special care has to be taken to ensure the salt being completely mixed with the soil, otherwise the seed is liable to be damaged.

The dressings were made across all the manurial and variety trial plots, and the weights are the average of the different plots. The result was the following:—The application of

2½ cwt. produced an average increase, about 4 tons roots.

5 cwt. produced an average increase, about 5½ tons roots.

10 cwt, produced an average increase, about 8½ tons roots.

15 cwt. produced an average increase, about 4 tons roots.

The big application of 15 cwt. was tried for the first time last year, just to see what the effect would be.

The experiment seems to demonstrate that the quantity of salt that can be used with the best result is 10 cwt. per acre for the mangold

Suckers on Corn.

In the past suckers on corn were regarded as very unhesirable and oftentimes the small boy had to go through the cornfield and pull them off. Recent experiments show that suckering of the corn plant is merely a response to its surroundings. When the stand is thin, as it is this year, there will always be plenty of suckers. The corn plants simply try to remedy the thin stand by suckering.

In an experiment several years ago where there were four plants in a hill eight suckers developed to each one hundred plants; where there were three in a hill, twenty-five suckers developed; where there were two in a hill, seventy-six suckers and where there was only one plant in the hill, 198 suckers developed to each one hundred plants. It was noticed that a large number of the suckers produced ears.

Another cause for suckering is the richness of the land. Rich, new land has been found to produce nearly twice the number of suckers as old, worn-out land. To some extent the tendency to suckers is no doubt inherited, but the main causes of suckering are the thinness of the stand, the richness of the ground, and the weather conditions.

Experiments conducted for two years indicated that it paid to leave the suckers on. The average yield for two years of corn with the suckers left on was eighty-one bushels, while for corn with suckers pulled off was sixty-four bushels. Many of the suckers must have produced good ears.—Wallaces' Farmer.

Nitrogen Germs.

The United States Department of Agriculture have issued a special circular to the effect that the extravagant and misleading claims contained in some of the advertising matter now appearing in regard to inoculating material for legumes make it necessary to again call attention to the limitations of the value of inoculation. Summarised from Department bulletins, they may be stated as follows:—

"No beneficial results can be expected for a particular crop if the bacteria for that crop are already present in the soil.

"But little, if any, benefit can be expected from the use of these bacteria if the ground is decidedly in need of other fertilizers, such as phosphates, potash or lime.

"But little, if any, benefit can be expected from inoculation if the soil is already rich in nitrogen.

"A recent examination of samples of cultures for inoculating legumes obtained through various seed firms throughout the United States indicates that there has been a slight improvement in the general character of these cultures."

HORTICULTURE

New Destructive Insect and Pest Act for the Dominion.

The lollowing is the text of the new Destructive Insects and Pests Act and the regulations issued in connection with the same. By the passing of this Act the San Jose Scale Act is repealed. It will be seen that the new Act and regulations are of a wider character and of a far greater protective value to the fruit grower and nurseryman. The fumigation regulations instituted under the Act have been incorporated in the new regulations with certain alterations. Under the new fumigation regulations conifers will be fumigated. It is hoped that this will assist in preventing the introduction into nurseries of several species of woolly plant lice which infest nursery stock and which are carried in the same.

In addition to the fumigation regulations, provision is made now for:

1. The inspection at the points of destination of European nursery stock (which is still exempt from fumigation) and such other stock as it may be deemed necessary to inspect.

2. The destruction of infested stock and packages, etc., containing the same and compensation for such matter as may be destroyed.

3. The inspection of orchards and nurseries and the treatment of infested vegetation.

4. The prohibition of the disposal in anyway of vegetation infested with insects scheduled under the Act.

5. The notification of the presence of any of the insects, pests or diseases.

In view of the increasing amount of nursery stock imported through the port of Niagara Falls, the importation season for that port has been extended and stock may now be imported between October 1st and May 1st.

The attention of importers of nursery stock is called particularly to the regulation under which notification must be given of the importation of nursery stock. All nursery stock, including European and such stock as is extempt from fumigation may be imported only during the periods specified under Regulation 3.

PROVISIONS OF THE ACT.

An Act to prevent the introduction or spreading of insects, pests and diseases destructive to vegetation.

(Note.—In what follows certain formal and unimportant clauses have been omitted. The number of each clause or regulation is the same as in the Act.—Editor.)

1. This Act may be cited as The Destructive Insects and Pests' Act.

3. The Governor in Council may make such regulations as are deemed expedient to prevent the introduction or admission into Canada, or the spreading therein, of any insect, pest or disease destructive to vegetation.

4. Such regulations may provide—

(a) for the prohibition generally, or from any particular country or place, of the introduction or admission into Canada of any vegetable or other matter likely to introduce any such insect, pests or disease.

(b) the terms or conditions upon, and the places at which any such vegetable or other matter may be introduced or admitted into Canada.

(c) for treatment and manner of treatment to be given to any vegetation, vegetable matter or premises in order to prevent the spreading of any such insect, pest or disease, and may prescribe whether such treatment shall be given by the owner or by a person appointed for that purpose.

(d) for the destruction of any crop tree, bush or other vegetable matter or vegetation, or containers thereof infested with or suspected to be infested with any such insect, pest or disease.

(e) for the granting of compensation for any such crop, tree, bush or other vegetation or containers thereof so destroyed, such compensation not to exceed two-thirds of the value of the matter destroyed and to be granted only by the Governor in Council upon the recommendation of the Minister.

(f) for the prohibition of the sale of any vegetable matter infected with any such insect, pest or disease.

(g) that the occupier of the premises on which is discovered any such insect, pest or disease shall forthwith notify the Minister of Agriculture and shall also send specimens of such insect, pests or disease.

*h) for the confiscation of any vegetable matter and the container thereof, if any, in respect of which a breach of this Act or any regulation made thereunder, is committed, and generally for any other purpose which may be deemed expedient for carrying out this Act, whether such other regulations are of the kind enumerated in this section or not.

5. The Minister may appoint inspectors or other officers for carrying out this Act and the regulations made thereunder.

6. Any inspector or other officer so appointed may enter any place or premises in which he has reason to believe there exists any such insect, pests or disease, and may take specimens thereof and also of any vegetable matter infested or suspected of being infested therewith.

7. The Minister, upon the report of any inspector setting forth a reasonable belief of the existence of any such insect, pest or disease in any area defined in such report, may prohibit the removal from such area or the movement therein of any vegetation, vegetable or other matter which, in his opinion is likely to result in the spread of such insect, pest or disease.

8. Every person who contravenes any provision of this Act or any regulation made thereunder, shall be liable, upon summary conviction, to a fine not exceeding $100 or to imprisonment for a term not exceeding six months, or to both fine and imprisonment. Any vegetable or other matter imported or brought into Canada contrary to this Act, or to any regulation made thereunder, shall be forfeited to the Crown.

9. The San Jose Scale Act is repealed.

REGULATIONS UNDER THE FOREGOING ACT.

1. "Inspector" means a person appointed for carrying out the provisions of the Destructive Insects and Pests' Act and the regulations made thereunder.

2. No tree, plant or other vegetation or vegetable matter infested with any of the insects, pests or diseases to which this Act applies, shall be imported into Canada except as hereinafter provided.

3. Nursery stock, including trees shrubs, plants, vines, grafts, scions, currings or buds entering Canada shall be imported only through the ports and during the periods respectively hereinafter mentioned, that is to say:

Vancouver, B. C., and Niagara Falls, Ont.—From October 1st to May 1st.

Winnipeg, Man., and St. John, N. B.—From March 15th to May 15th, and from September 26th to December 7th.

At these points of entry the importations shall be fumigated in the fumigation houses provided for that purpose, and a certificate of fumigation will be issued, without which no stock may be taken out of bond. Importations by mail shall be subject to the same regulations.

Provided, however, that the following vegetation shall be extempt from fumigation:

(a) Greenhouse plants with the exception of roses and other woody plants.

(b) Herbaceous perennials (the stems of which die down in winter) such as perennial phlox, peonies, sunflowers, etc.

(c) Herbaceous bedding plants such as geraniums, verbenas, pansies, etc.

(d) Bulbs and tubers (such as hyacinths, lilies, narcissi and other true bulbs, and also the tubers of dahlias, irises, etc.)

(e) Nursery stock orginating in Europe.

Cottonwood or Necklace Poplar (Populus deltoides) when shipped from and grown in Dakota or Minnesota, two of the United States of America, may be admitted at the customs ports of Brandon or Winnepeg, Man., and without fumigation.

4. The port by which it is intended that the nursery stock shall enter shall be clearly stated on each package, and all shipments made in accordance with these regulations will be entirely at the risk of the shippers or consignees, the Government assuming no responsibility whatever.

5. All persons importing nursery stock into Canada shall give notice to the Minister within five days of despatching the order for the same, and they shall again notify the Minister on the arrival of the shipment in Canada.

6. European nursery stock, and such other imported vegetation or vegetable matter as the Minister may determine, entering Canada may be allowed to proceed and shall be inspected at the point of destination but must not be unpacked except in the presence of an Inspector.

7. If, on inspection, nursery stock or other vegetation or vegetable matter is found to be infected with any of the insects, pests or diseases hereinafter specified, it shall be destroyed to the extent deemed necessary by the inspector and in his presence. All cases, packages and packing in which such stock has been contained shall also be destroyed in the same manner.

8. Any inspector entering lands nursery or other premises where there is reason to believe that any of the insects, pests or diseases hereinafter specified are or may be present, shall give instructions for the treatment or destruction of any tree, bush, crop or other vegetation or vegetable matter or the containers thereof, which may be found or suspected to be infested with any of insects, pests or diseases hereinafter specified, and such instructions shall be carried out by the owner or the lessee of the infected or suspected vegetation, vegetable matter or containers thereof, and such remedial treatment shall be carried out and continued until the insect, pest or disease shall be deemed by the inspector to have been exterminated.

9. Compensation not exceeding two-thirds of the value as assessed by the inspector, of the vegetation or vegetable matter or container thereof, destroyed by the instructions of an inspector, shall be granted by the Governor in Council upon the recommendation of the Minister.

10. It shall be illegal to sell, offer for sale or in any way dispose of or receive any trees, shrubs or other plants, vegetable matter or portions of the same, if the same are infested with any of the insects, pests or diseases hereinafyer specified.

11. The owner, occupier or lessee of any premises or place where any of the insects, pests or diseases specified herein shall be found, shall immediately notify the Minister and

HAD TRIED MANY REMEDIES FOR

CONSTIPATION

FOUND NONE TO EQUAL

Milburn's Laxa-Liver Pills

Constipation is one of the most prevalent troubles the human race is subject to, and is the greatest cause of many of our ailments. Keep the Bowels open and you will very seldom be sick.

Mrs. M. Bell, 467 Harris St., Vancouver, B.C., writes:—"I had tried many remedies for Constipation and never found any so satisfactory as your Milburn's Laxa-Liver Pills.

We always keep them in the house and would not be without them.

"I recommended them to a neighbor and she is highly enthusiastic about them, as her's is a very difficult case, and she expected no good results from them. You may imagine her surprise and gratification when she found that they completely cured her."

Milburn's Laxa-Liver Pills are 25c per vial, or 5 vials for $1.00, at all dealers, or will be mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

shall also send him specimens of such insects, pests or diseases.

12. The destructive insects, pests and diseases to which the said Act shall apply include the following:

The San Jose Scale (Aspidiotus perniciosus.

The Brown-tail Moth (Euproctis chrysorrhoea.)

The Woolly Aphis (Schozoneura lanigera.)

The West Indian Peach Scale (Aulacaspis pentagona.)

The Gypsy Moth (Porthetria dispar.)

Potato Canker (Chrysophlyctis endobiotica.)

Parasitic diseases affecting potatoes externally or internally.

Branch or Stem Canker (Nectria ditissimi.)

Gooseberry Mildew (Sphaerotheca nors-uvae.)

White Pine Blister Rust (Peridermum Strobi).

13. The importation of potatoes into Canada from Newfoundland or the islands of St. Pierre or Miquelon, is prohibited.

14. The Minister may, upon special request to that effect, authorize the importation into Canada of any insect, pest or disease herein specified, but for scientific purposes only.

15. The regulations made under the San Jose Scale Act are repealed. —C. Gordon Hewett.

The Little Garden Spot

Jake H. Harrison.

The poultryman may pipe his lay,
The butcher boast his meat,
The man who keeps the grocery
May sell us things to eat;
But after all, the garden spot,
That little "patch" of ground,
If tended in the proper way,
Brings most, a living sound.

It is the best of all the farm,
That worthy "patch" of land,
Where beans and peas and cabbages
Stand forth in phalanx grand;
Where "new potatoes" always grow,
And flourish in the spring.
And large tomatoes redly blush,
As fine as anything.

There radishes and lettuce grow,
And onions may be seen,
And cucumbers and squashes, too,
And pie plant rich and green;
And red strawberries in their beds,
And other kinds of things,
Which to the farmer's appetite
A healthy relish brings.

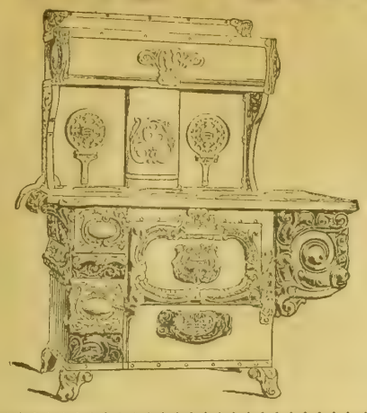
The poultryman may sing of eggs,
And how the chickens pay,
They are no doubt a source of gain,
And handy in their way;
But still the little garden spot
Is surely hard to beat,
And leaves the chickens far behind,
Producing things to eat.

Then give the garden spot a chance,
If you are on the farm,
Remembering, at ilde times,
The hoe will do no harm;
Your poultry may be well enough,
But I have this to say,
The garden, from a living point,
Will beat it any day.

In ordering fruit trees this fall do not get every variety that has recently been introduced. Get standard varieties that have stood the tests of time and that are propagated and recommended by reliable nurserymen.

When you place your order for fruit trees, include a few good shade trees and permit your wife and daughters to select some shrubs and flowers. Money cannot buy articles that give more pleasure and comfort than fruits, shrubs, shade and flowers.

THE CAPITAL FAVORITE



is a high class Family Steel Range adapted for either coal or wood. It is honorably built of the best material, and put together as tight as a steam boiler.

It has a roomy fire box for wood and the linings can be changed from wood to coal or vice versa without the disturbing of a bolt.

This Range is made of Heavy British Cold Rolled Non-Corrosive Polished Steel. It never needs black-leading, only an occasional light rub with a cloth will keep it clean and bright.

Lots of room on the top and in the oven to do the busy morning's work.

There are thousands of these Ranges in the homes of the best farmers in the country, giving absolute satisfaction.

Ask your dealer for **THE CAPITAL FAVORITE** and take no other.

Making Exhibition Butter.

Every fall I get letters from people asking me to give them suggestions regarding the making of exhibition butter. I thought the hints I give to the few might perhaps be appreciated by the many whose ambition leads them to try for the butter prizes, and perchance add to their fame as butter makers, also a few dollars to their spending money. It is a worthy ambition to help on the fairs in this way and if entered into with the right spirit leads to a wholesome rivalry which is good for a community.

With the greater refinement manifest in all phases of living has come a more fastidious taste in regard to butter. Of this change no one is in closer touch than the expert judges who visit the fairs. They know what the best buyers in the market are demanding and make the awards to the packages coming nearest to the requirements.

Year by year the desire for a highly flavored butter has lessened and now that butter which scores highest has a very mild creamy flavor—one would almost say a lack of flavor were it not so pleasing and clean-tasting to the palate.

This flavor is brought about by having the cream with a low percentage of acid in it. In other words with a very mild sour taste. Apart from the acid in the cream the flavor may be due to the kind of bacteria, some forms producing a more pronounced odor and flavor than others. If a butter-maker has doubts about the culture she is using, or the flavor brought about by the natural souring of the cream, it would be well to procure a culture from the O. A. C. or from a creamery where the butter is of No. 1 quality. Always give a new culture a trial test before using it for exhibition butter.

HOW TO PASTEURIZE.

If there is the least suspicion of any objectionable flavor being in the cream due to feed, unclean milking, etc., it is wisdom to pasteurize the cream. The method has been often told but it may be best to repeat it. Heat the cream to 160 degrees by setting the can in a vessel of hot water and hold at that temperature for 30 minutes. A higher temperature is now recommended but is apt to give a cooked or boiled milk flavor to the butter, so for exhibition work I would be on the safe side and not go over the 160 degrees. The cream should be stirred while heating and after standing the half hour should be quickly cooled to 60 degrees or lower. Such cream needs to have from 5 per cent. to 10 per cent. good culture added to it, and should be ready for churning the next day.

Hand in hand with the mild flavor has come the desire for lighter colored butter. A clear straw color meets the taste of the fastidious. I have known butter to be scored severely when the cow alone had been responsible for the high color. However, with the careful judge it is the evenness and clearness or brightness rather than the depth or shade of color that counts.

To obtain that firm, waxy texture so desirable, I believe it necessary to hold the cream for some hours at a temperature some degrees below churning. Then just before putting the cream in the churn bring it to the required temperature, having it on the cool side rather than have the butter come too quickly and be soft.

There is no use to state temperatures for conditions have to be always considered. With good cream, and the churn not half full, I like the butter to come in from 20 to 30 minutes. I find from experience with cream that the temperature which will bring the butter in that time is right.

Just before drawing the buttermilk add some cold water and revolve the churn a few times, rapidly. This frees the buttermilk from the butter, and it will drain away much more readily. Rinse down the butter with a little of the wash water, then wash but once. Much washing robs the butter of its aroma and gives it an insipid flavor.

SALT LIGHTLY.

Light salting is also another requirement of the high-class market. It is not desirable to hide the sweet, creamy flavor with salt, neither is it necessary to use excessive salt to keep the butter for it is supposed now to soon reach the consumer.

With small churnings, I prefer when making exhibition butter, weighing the butter and salting it at the rate of ¾ oz. a lb. This is for prints for the home market.

Sift on the salt and give the butter a slight working. Allow it to stand two or three hours, but do not let it become hard. At the end of this time give it another working, using pressure only, as a sliding, rubbing motion produces a greasy texture. Only work sufficiently to expel excessive moisture and to insure an even distribution of the salt.

Use the best of parchment paper and have the package entirely free from holes and neatly wrapped. Avoid all fussiness.

See that the butter is thoroughly chilled before taking it to the fair, otherwise it is impossible for the judge to pull out with his trier a nice smooth plug of butter from the print. Many a good butter maker does not get the high score she should because her butter has not firmed before coming to the fair.

It is always best to make the butter early the day before it is to be taken to the fair. I consider it gets a better texture and flavor by being at least a day old before being submitted to the trier of a judge.—Laura Rose, in Farm and Dairy.

Magnet Cream Separator "Sanitary Strainer"

For STRAINING MILK. Patent No. 123484.

PRICE $1.00 COMPLETE.

Fits the MAGNET Tank or any pail of same size.

All milk strainers have failed to meet the requirements of Dairy Authorities except the cloth strainer, which can be washed clean.

The difficulty of holding the cloth on the top of the pail or tank has prevented the general adoption of the cloth strainer on the cream separator.

By a simple spring device (MAGNET PATENT), which circles the top of the tank and holds the cloth in position, this difficulty is overcome and the milk strained directly into the tank.

The advantages are :—

1st. Great convenience in straining the milk.

2nd It retains the animal heat thus enabling more complete separation of butter fat from the milk.

3rd. Prevents dust or foreign matter from falling into the tank.

4th. Nothing to wash except the cloth.

5th. Time and labor saved. Adjust the spring over the cloth, holding it tight around the top of the tank, that is all.

6th. The only "Sanitary" Strainer known.

7th. It is simple, clean and will not wear out.

8th The same MAGNET quality to the strainer as in the Cream Separator.

9th. Every MAGNET Tank should have one fitted on.

Fill in the coupon with name and address, enclose **one dollar** and strainer will be sent you prepaid Money refunded if you do not find it the handiest article in your dairy.

Please send a MAGNET "SANITARY STRAINER," charges paid,

Enclosed please find $1.00 stamps of postal order. To ..... P. O ..... Province .....

Vancouver, Calgary, Winnipeg, Hamilton, Montreal, St. John.

Breeding Dairy Cows.

There are three essentials that we must bear in mind when we seek to breed dairy cattle of the highest class. They are: 1st, the qualities that make a desirable animal; 2nd, profitable production; 3rd, reproductive ability. I shall consider these in the order named.

The qualities that make a desirable animal, are usually expressed by the word Constitution. As used by breeders, constitution indicates strength and the ability of an animal to maintain its general health and vigor and its productive and reproductive powers unimpaired to a good old age. The score card points allotted to constitution are merely those indicative of physical health and strength.

It is far easier to get good prices for well formed, attractive cattle, and form is the only visible indication of performance. Wherever you find a man selecting, breeding and caring for his cows intelligently, you will find a herd returning a large profit. And when you find a man that is indifferent regarding these things, you will find a herd that returns at the best a very small profit. The great secret is the individual cows of the herd; in every herd there is an enormous variation in the production and profit of the different cows. There is only one way to secure the highest profit from your herd and that is to know what each cow is doing and to keep the best. The cow testing associations

ONE OF THESE "SWISS ARMY" RIFLES FOR SEVEN NEW SUBSCRIBERS

We have purchased several hundred Swiss Army Rifles, They are repeating Rifles, holding 12 cartridges, 42 calibre in the magazine and one in the chamber. The action is the reliable bolt type, and works quickly and smoothly. The barrel is rifled and is sighted for long ranges The front sight is open and the rear sight adjustable for elevation. **Guaranteed perfect.** This is the famous "Swiss Army" rifle. It is splendid for hunting deer and larger game etc. No one living in the country should be without one of these rifles Only a limited number to be obtained. If you want one you should start to-day to secure seven new subscribers, If you intend earning a rifle drop us a card to-day and one will be reserved for you as long as they last, Don't delay, start to-day.

Address—**MARITIME FARMER, Sussex, N. B.**

PROOF

That Farmers all over the World are Discarding Common Cream Separators for

SHARPLES DAIRY TUBULARS

We will mail to you, free, large pictures showing the immense number of common cream separators recently exchanged for Sharples Dairy Tubulars. These pictures would cover more than one page of this paper, and are positive proof that farmers all over the world are discarding common machines for Sharples Dairy Tubulars. These pictures show just a short time accumulation of these discarded common machines. Write for these pictures at once.

Sharples Dairy Tubular Cream Separators contain neither disks nor other contraptions, yet produce twice the skimming force, skim faster and skim twice as clean as common machines. Because Dairy Tubulars are so simple, they wash many times easier and wear several times longer than common separators. Tubular sales exceed most, if not all, others combined. Tubulars probably replace more common separators than any one maker of such machines sells. The World's Best. The manufacture of Tubulars is one of Canada's leading industries.

Quality Butter

If you have never used a "FAVORITE" CHURN, you can't imagine what a difference it will make in the quality of the butter.

The "FAVORITE" is known all over Canada as the Churn that brings the quality butter—and gets every drop of butter out of the cream. Hand lever and foot tread—8 sizes.

"Puritan" Washer is another old favorite. Washes a tubful of clothes in five minutes. If your dealer does not handle them, write us. 74

DAVID MAXWELL & SONS, - ST. MARYS, ONT.

under the control of this society furnish the best way of doing this work The breeders of pure bred dairy cattle in this State are missing great opportunities by not doing everything possible to organize such associations in their own neighborhoods.

If you desire to build up a permanent herd to receive enduring benefit from your work of testing and selecting you must seek for reproductive ability.

While the scrub cow may have productive ability and be a fairly desirable individual, there is little chance that she has within herself the power of producing offspring with her good qualities unless she is mated with a bull capable of transmitting those same qualities. Mated with a bull of her own class her own merits will be great indeed if she can impress them upon her offspring. Among grade cows of the established dairy breeds desirable individuals and profitable producers are the rule rather than the exception, and when mated with purely bred bulls of their respective breeds these qualities are usually reproduced. Mated with grade bulls like themselves the tendency of hybrid matings to revert will produce a mixed offspring, some good and some bad. In pure bred herds we expect to find the desirable qualities and productive ability reproduced with certainty. You may conclude from what I have said regarding the comparative reproductive abilities of scrub, grade and pure bred that the pure bred is always a desirable animal. I do lay great stress upon pure blood because it is the source from which we must draw the blood for all breed improvement. But a pure bred animal should be pure, not only in the sense of being eligible to registry, but pure bred because it is free from the blood of unproductive ancestors. In testing a pure bred herd we will usually find about as wide a variation in production as in any other herd, but in good herds it varies around a far higher average. We will also sometimes find that the daughters and granddaughters of some certain animal group themselves together and whole families will be found whose production is uniform and far above the rest of the herd.

When a breeder finds a family of this sort he should devote his energies to developing it, for he has a firm foundation upon which to build for such families are the real source of all improvement in breeding. JOHN CLARK.

Some July Contrasts.

On the milk record sheets received at the Dairy Division, Ottawa, from members of cow testing associations there are found some good yields of milk and butter fat for July; for instance, in the Bertie, Ont., association one cow that freshened in May gave 1320 pounds of milk, testing 4.0 per cent. of fat, equal to 52.8 pounds of fat. One herd of 17 cows at Glanworth, Ont., has an average of 926 pounds of milk, the herd including 5 two-year-olds. Some cows in this herd have given 4840 pounds of milk in 4 months. At Cassel, Ont., 183 cows averaged 858 pounds of milk, 3.6 test, 28.3 pounds of fat.

The records of many individual cows in these and other associations show a yield of barely 650 pounds of milk and 22 pounds of fat, or less than half of many good yields.

Dairy farmers, it is not difficult for you to make three very simple deductions from these remarkable contrasts. First: there are plenty of cows still being kept for milk production that are not worthy the name of dairy cows. Second: scores of dairy farmers are getting excellent records from selected herds. Third: records alone do not increase the yield of milk and butter, there must be intelligent selection of good cows based on the lessons that individual records teach. C. F. W.

Ottawa, August, 1910.

WINDSOR DAIRY SALT

"Expect to get the prize for the best butter, this year?"

"Of course I do.

I have the best cows in the country—and here's my Windsor Butter Salt.

You can't beat that combination.

You know, I have won first prize for the best butter ever since I began to use Windsor Butter Salt"

"Hope you win"

"Thank you, so do I"

Dairy Barn Ventilation

A good ventilating flue should possess all the essential features of a perfect chimney. The walls should be air tight so that no air can enter except through the stable. The top should rise well above the ridge of the roof and it is best, though not necessary, to place it near the centre of the stable. Whenever the length of the ventilator must be unusually short or it must be placed in any unfavorable position for a strong draft, then it should be made larger, to make good the other defects. Double-tongued and grooved lumber with acid and water proof paper between may be used to good advantage, but the lumber should be well seasoned and great care should be exercised by the carpenter in making the joints.

The top of a ventilator should be provided with a storm shield. This may be in the form of a simple roof. Care should be taken to place this high enough above the shaft so there is left abundant outlet across which the wind may at all times have free sweep. The lower end of the ventilating shaft should reach to or near the floor and should be provided with its main inlet for taking up foul air at the bottom. The size of this inlet should be equal or nearly equal to the cross section itself. The ventilating shaft should also be provided with an intake just below the ceiling and this should be provided with a door or lid so that it may be partly or completely closed at will. The object of the inlet at the ceiling is to make provision for the escape of the warm air at the ceiling at times when the stable may be too warm or at times when there is but little wind movement outside and the draft may need to be reinforced by the addition of warm air of the stable. When the ceiling is sufficiently tight it acts as a heated radiator, sending its warmth back upon the animals upon the floor, thus keeping the stable at a higher temperature than would be possible if the warm air were permitted to escape all at once at the ceiling.

Now to utilize the heat accumulated at the ceiling to the best advantage, the fresh, pure, cold air must be brought in at the level of the ceiling and caused to mingle with it as completely as possible so that the cold air may be warmed by the warm air before it drops to the level where the animals breathe it. To secure this, provision is made for the fresh air to come into the stable at a considerable number of small openings near the ceiling on as many sides of the barn as is practical. In order to prevent the warm air at the ceiling escaping through the intakes, they must be carried downward by some construction so that the air is forced to enter at some level on the outside, four feet or more below the level of the inside. This acts on the principle of the air trap, for the warm air of the stable cannot readily pass downward.—University of Ohio Bulletin.

"Can be depended upon" is an expression we all like to hear, and when it is used in connection with Chamberlain's Colic, Cholera and Diarrhoea Remedy it means that it never fails to cure diarrhoea, dysentery or bowel complaints. It is pleasant to take and equally valuable for children and adults. Sold by all dealers.

LIVE STOCK.

When Should a Pig be Killed ?

Much has been said and written on this subject, but no hard-and-fast rules can be laid down, because the best age for killing a pig depends not only on what it is wanted for, but the kind of pig it is and how it has been fed. There are, however, limits within which, as regards age and weight, the pig-feeder should keep, since young small pork can be produced more cheaply than older and heavier pork. There is no question in management more definitely settled than that it costs less per pound to make meat from a young animal than from an older one. This has been proved over and over again, not only by means of experiments and at the fat stock shows, but by all intelligent breeders of meat animals, and is apparent from the fact that to put a third hundred pounds on a pig already weighing two hundred, it must be given food of support for the latter weight while adding the hundred pounds. This means that the cost of producing a pound of gain in live weight increases as the animal becomes older and heavier, and that in the making of heavy hogs there is no profit. Not only does each pound of pork within certain limits cost more to produce, but it actually sells for less money, and reference to any market report will show a marked difference.

Probably few even among those cute enough to see the advantages of porker feeding realize how greatly the cost of production increases as the animal becomes heavier, or they would be still more keen on supplying the small, lean meat for which the modern consumer is willing to pay the higher price. If space permitted a mass of evidence could be adduced to demonstrate the increase in the cost of gain in weight as age and weight increase, but the results of a couple of experiments will suffice:—

Lawes and Gilbert, at Rothamsted, in a ten weeks ' feeding trial with pigs weighing 135 pounds each, and feeding to a weight of 275 lbs., found that at the start 386 pounds of food produced 100 pound live weight. At the end of four weeks 502 pounds were necessary, and in the ninth and tenth weeks 610 lbs. A similar experiment carried out at the Michigan station showed practically the same result, as during the first period of feeding 381 pounds of food produced 100 pounds of gain, and in the fifth period 508 pounds were required to produce the same result. In a feeding experiment conducted at the Ontario Agricultural College, although there were other matters involved besides the cost of producing each pound of gain in live weight, with which we are not concerned here, a good deal of light was thrown on this subject of cost. The test showed that while increasing in live weight from 54 pounds to 82 pounds the pigs required 3.10 pounds of meal per 1 pound of gain; while increasing from 82 pounds to 115 pounds they required 3.75 lbs. of meal per 1 pound of gain; while increasing from 115 pounds to 148 pounds they required 4.38 pounds of meal per 1 pound gain; and while increasing from 148 pounds to 170 pounds they required 4.55 pounds of meal per 1 pound gain. It is generally considered that well-bred pigs, eight or nine months old, weighing 200 pounds to 220 pounds live weight are thriving well if they yield one pound of dressed meat for every five pounds of meal consumed. Young pigs require much less. These figures go to show that the 8-stone to 10-stone porker costs less to feed than the larger animal, and we know that it sells for more money- a strong argument in favor of marketing pigs early. There are, of course, exceptions, as when more mature animals are required to clear up certain kinds of waste which younger animals could not deal with or could not digest; but in the case of the pig fed mainly on purchased meals the sooner he is got "fit" and "quitted" the better from the point of view of profit. Porkers and small baconers should be fit for the butcher almost from birth to death, but a bacon pig will probably be more profitable if it is killed at about six months old, assuming that skill and care have been brought to bear on getting it ready, than at the more common age of eight or nine months.

Breeding Ewes Should Receive Early Attention for Best Results.

A vital matter in successful management of breeding ewes during the later summer months is fitting the ewes for mating, says Leo. C. Reynolds in Tribune Farmer. Experienced flock owners will agree that the physical condition of the ewes at mating has a marked and permanent influence upon pregnancy, upon performance during the nursing period, and also upon the vigor of the young at birth. At this season of the year, when pastures are scant of sufficient supply of nutritious forage, and the ewes are suffering from the heavy draft upon their vitality from suckling their rapidly growing lambs, there is real danger on the part of flock owners overlooking the importance of giving special attention to fitting the ewes for mating.

A large number of valuable ewes fail every season to breed at first service or become barren on account of being in low flesh condition at mating.

It is a prevalent practice among flock owners at weaning time to direct attention to growing the lambs preparatory for marketing, and neglecting to arrange for the ewes to receive equally as good care. The breeding ewes first last and at all times should receive the flock owner's consideration. They are the foundation of his business and the direct means through which he has been able to secure his season's lamb crop, and the only means through which the work may be perpetuated.

No flock owner should mate ewes when declining in weight, vigor or vitality. If an animal is below normal in flesh condition nature prevents taking on additional burden until the system has regained sufficient strength to withstand the strain. On account of some ewes in the flock failing to breed many flock owners conceive the idea that they have become diseased, and not infrequently dispose of them. Had these ewes been properly cared for and recruited up to normal flesh condition after the lambs were weaned, in all probability they would have conceived at first service. I have encountered several instances in my flock where ewes were low in flesh at mating time and would not breed. After removing them from the flock and giving them special care and feed no trouble was encountered. Where a large number of ewes are allowed to run together one is taking great risk in not separating the weaker ewes from the stronger and giving them additional attention. There is nothing equal to clover pasture for the ewes after the lambs are weaned as a source of forage supply to aid the process of recruiting the system. Coarse pasture, like timothy and lowland grass, is undesirable. there is supplementary forage a hand it can be fed to great advantage.

The ram is generally in good flesh when turned into the flock at mating time, but the whole trouble lies with

Advertise in the Maritime Farmer.

the ewes that have been heavily worked during the season. If flock owners would endeavor to fit their ewes for mating as well as they do the ram there would be far less trouble and a much higher percentage of strong, vigorous lambs at lambing time.

There is an economic advantage in properly fitting the ewes for mating that no thoughtful flock owner can afford to ignore. After the ewes are separated from the lambs and are placed upon goad pasture they immediately begin to recruit in flesh and vitality. By the time the mating season arrives they are in a uniform healthy condition. In all probability they will be ready to mate within two or three weeks, and if nothing goes wrong very few of the ewes will return for second service, and what few do are generally the first to mate. Under these conditions the lambs will be dropped along about the same time the following spring, thus giving the flock owner a fine lot of material of uniform size and age with which to begin his season's work. It is a great deal easier and much more encouraging to handle a bunch of lambs that are about the same age than it is to have them all ages and sizes; but the economic advantage comes when ready for the market. Every flock owner knows that an even uniform bunch of lambs has a higher market value than a lot of various grades and ages. An even bunch of lambs will sell anywhere from a quarter to a cent higher on the market than they would if possessed of a wide variation of size and conformation.—Maine Farmer.

Rations for Fattening Cattle.

The Department of Agriculture for Ireland being impressed with the idea that much material benefit to Ireland would result if a larger proportion of the surplus cattle available for exportation were sent to the English markets in finished condition, instead of as stores, arranged for a deputation of Irish farmers to visit Scotland and report upon the dead meat trade of that country. The report of the deputation is published in the recent issue of the Journal of the Irish Department of Agriculture, and makes interesting reading. The following is an extract from it:—

The basis of feeding is essentially turnips and oat straw. Some farmers give the turnips to their cattle in the whole state, while others prefer to feed them sliced. All are, however, agreed that it is the turnips that go to lay on the solid furnishing of the carcass, and give the desired "marbling" and solidity of texture to the beef. Indeed, it is claimed that in this respect the quality of the turnips grown on the Aberdeenshire soil cannot be equalled for feeding value, and to this fact is due that the county possesses such a lead as a fat-cattle producing centre. Straw is solely relied upon as fodder. Any hay grown is sold off, and does not constitute, as in this country, even a part fodder-ing for the cattle which are being fattened. The concentrated feeding stuffs gipen are, to a large extent, home grown, though cake and cake meal are also widely employed. The following rations given at four different farms may be taken as typical:—

Ration No. 1.

6 a. m.—2 lb linseed cake, allowance of turnips, (sliced), straw foddering.
10 a. m.—Allowance of turnips, straw foddering.
4 p. m.—Allowance of turnips, 4 lb of rolled oats.
7 p. m.—Straw foddering.

Ration No. 2.

5 a. m.—4 lb. of cake.
7 a. m.—Allowance of turnips, (sliced), about 50 lb. each; straw.
1 p. m.—Similar quantity of turnips, straw.
4 p. m.—Similar quantity of turnips, straw.
7 p. m.—4 lb. mixture of crushed barley and oats moistened with diluted treacle.

Ration No. 3.

6 a. m.—Turnips, straw.
9 a. m.—4 lb. of barley meal and "prone"—i. e., oat husks moistened with diluted treacle.
4 p. m.—Turnips, straw.
7 p. m.—4 lb. barley meal mixture.

Ration No. 4.

6 a. m.—Turnips given whole, straw.
10 a. m.—Turnips given whole, straw.
4, p. m.— Turnips given whole, straw.
7 p. m.—46 lb. rolled oats moistened with diluted treacle.

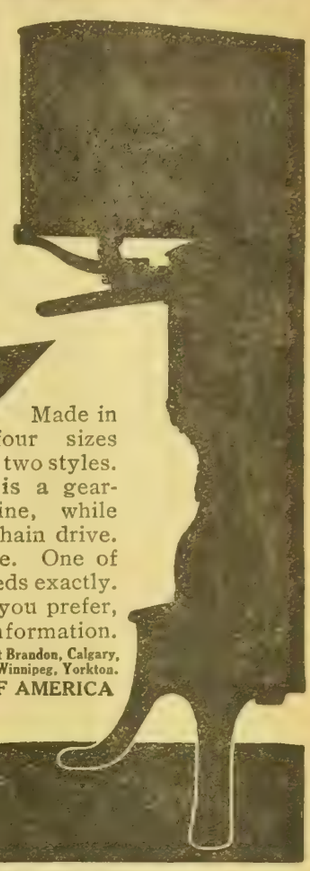
The feature of tnese rations is the length of the feeding day and the fixed regularity of the hours at which the different feeds are given. It will be noticed that the quantity of roots consumed by a beast in the day is very high, more especially in rations Nos. 2 and 4. In the last case, where the turnips were given whole, the cattle being fed were strong three-year-old bullocks, and the cattleman simply wheeled a large heaped up barrowful of roots from the adjacent food house, and up ended it into the two troughs of each companion pair of bullocks. The cattle fed on this last system, moreover, invariably fetched top prices at the local sales, and the reason assigned for this by the feeder was the large quantity of turnips, which, as the purchasers were aware, the animals consumed during the feeding period. In this connection it was a matter of interest to note the reputation which individual farms possessed among buyers for the quality of the cattle finished on them. Evidently, when the system of feeding is known, the animals can be relied on to kill well, and this ensures top prices being obtained when cattle thus fattened appear in the auction ring.

GET A *GOOD* SEPARATOR

DON'T buy a separator that will mean more work, more time, more trouble, and less profit. You do not have to take chances. There is one sure way to know a good separator—one sure way to get one. Look for the I H C trade mark—a seal of excellence and a guarantee of quality. Then you can be sure your separator will skim to a trace, is simple, light running, and most durable. Then you will get a pound more butter from every cow, every week.

I H C Cream Harvesters have a most enviable record among thousands of the best farmers and dairymen in America. The many I H C features and money-making advantages should appeal to you.

After close investigation, you will find that they are the only separators with dust-proof and milk-proof gearings. You will find in them the most perfect straining device—insuring pure cream and skim-milk always. You will see that the frame of an I H C is entirely protected from wear by bronze bushings at all points; that the I H C has largest shafts, bushings, and bearings; that it has the safest, simplest, surest, and most economical oiling system; that the flexible top-bearing prevents vibration and keeps the bowl steady, no matter how unevenly the power is applied; that the crank is at just the right height for convenient turning and the supply can is low enough for easy lifting.



I H C CREAM HARVESTERS

Made in four sizes and two styles. Bluebell is a gear-drive machine, while Dairymaid is a chain drive. You have a wide choice. One of these should meet your needs exactly. See the I H C local dealer, or, if you prefer, write to nearest branch house for full information.

COME AND SEE US.

THE HORSE.

The French Canadin Horse.

Horsemen in Canada are greatly interested in the recent action of the Federal Government at Ottawa in giving authority for the establishment of a stud book in which the French Canadian type of horse will be eligible for registration.

There was a time when this breed was distinctive of the Province of Quebec, but outcrosses with unsuitable stallions, chiefly Clydes and Belgians, have practically exterminated the type which once was predominant. There are, however, in a few districts some good specimens still, and an effort is to be made toward rehabilitating the breed.

The true French Canadian horse of half a century ago was a stout bodied horse on short legs. He had many of the qualities of the Morgan, although as a rule much larger than his American cousin, and there is little reason to doubt that many Morgans brought from Maine and Vermont across the Canadian border were used in the stud throughout Quebec and that some of the most prized of the French Canadian horses had a strong infusion of the Morgan blood. Their trappy action and lightness of foot showed that, it being no extraordinary thing to find horses of 1400 pounds and more capable of 2.40 speed, with the bend of the knee and the flex of the neck that are the delight of every man who knows the horse and what is most desirable in gait.

That the thoroughbred sires and mares brought from England by the cavalry officers in the early days were parent stock there is no disputing. The fine muzzles, clean throttles and broad, flat legs, with tendons like ivory, would be an open guide to any student of horse breeding, but there is still more tangible evidence in the knowledge gleaned from men of the type of the late Etienne St. Germain of this city, who bought and sold horses all over Quebec and Ontario for more than sixty-five years.

He handled thousands of the French Canadian horses and was an authority on the breed, the disappearance of which he never failed to deplore. His belief was that the sturdy mares brought from France by the original settlers of Quebec, crossed with the thoroughbreds and the Morgan, was the original blend, and as long as that policy was pursued Quebec held its pre-eminence as a horse producing province.

In the American civil war many thousands of the desirable animals which in any kind of service were bought by agents of the United States and sent to the front speedily became famous. The horses of that day from 1861 to 1866 were described by St. Germain in a conversation with the writer as being of an average weight of 1200 pounds. They had fine, small heads, with prominent eyes which gleamed like jewels.

Their ears were fine and ran to a point, and when they were raised the tips almost touched, so beautifully were they set. The throat was invariably fine even in the largest specimens, where any coarseness would be looked for, and the neck, while often short, was indicative of strength rather than of mongrel breeding. Their shoulders were well placed and the back so short and the coupling so close that the source of their marvelous strength was apparent at a glance.

They were long underneath and their muscular development in the arms, thighs and gaskins was what would be looked for in horses that were used in the lumber woods in the winter months and on the hilly farms and roads of Quebec in other seasons. Their feet were as hard as flint and of that gray-black hue which betokens perfect texture of horn. Their hips were broad and flat and a curb, spavin or split was a rarity, and ringbones as a hereditary blemish was unheard of, according to this expert.

Their most distinguished characteristic was heavy manes, tails and foretops, the hair of the former invariably falling to the point of the shoulder and often to the knee, while the bottom of the tail in many instances reached the ground. In the cases of the stallions the manes had to be turned on alternate sides of the neck in successive years to prevent the crest from being pulled out of shape, so heavy was the mass of hair.

Their strength was prodigious and for their inches they could outpull any horse in the world. Used in the heavy snows of the long winters, where they were often up to their backs in the lumber woods and sharply shod, it was a rare thing for them to cut themselves. The average coldblooded or mongrel horse will struggle when placed in a like position, and if shod sharply will tear his legs to pieces in a wild scramble to extricate himself.

CHARACTERISTICS.

Not so the French Canadian. He will settle down in the soft, yielding mass waiting the command of his driver, and when he is told to "marche" it is a picture to see him set his splendid shoulders in the collar and hang in the traces with muscles bulging until the load moves. There is none of the wild flying and plunging at the load which is characteristic of some horses. The Canuck knows how to utilize his strength, and once the load is in motion he keeps on until restrained.

When Sunday comes he takes the family to Mass at a round trot of from ten to twelve miles an hour, and perhaps on the road home if Francois Hippolyte or Jean Baptiste should happen along with a chip on his shoulder the nags can put up a spirited race and show a matchless purity of action, for they all have that round, hoop-like swing that carries them over the ground without boot or weight, and shod by the country blacksmith in any style his native fancy dictates, the trotting instinct is there.

Is it any wonder that the French Canadian is jubliant about the coming rejuvenation of the breed? The marvel is that the good people of this province were so short sighted as to be led astray by experiments which well nigh cost them the extermination of their prized type. That they have become wildly enthusiastic over the work begun by Dr. Rutherford, the chief veterinarian of the Dominion Government, who, together with Dr. Couture of Quebec, and William P. Kearney of this city, has been chiefly responsible for bringing the attention of the government to the importance of the enterprise, goes without saying.

There is to be a rounding up of the desirable types, which will be registered, and it has been decided that the thoroughbred and the standard bred (trotter) will be utilized in the rehabilitation of the strain. Stallions of these breeds must come up to a certain standard of excellence before they will be accepted. Dr. Rutherford is a capable official and in his hands the work will be well done.

Some of the best types of the French Canadian horse now found are owned on this island, while the country around Three Rivers has always had a few that were considered representative by those who have made a study of the breed. The writer while walking along the Cote de Lisse road on the Island of Montreal one day last spring was attracted by a handsome black mare which stood in a paddock not far from the highway.

A farmer was ploughing in an adjacent field and when questioned he told the mare's history. She had decended in an unbroken line from stock which had been raised on the same farm for more than a hundred years, and the eyes of the habitant sparkled as he recited the deeds of the mare and her antecedents. She was heavy with foal and the breeze blew her luxuriant mane and tail about her as she dozed in the brilliant sunshine. She had been bred to a famous horse of her own color. She was a perfect type, and her owner will undoubtedly find a place for her and her progeny in the new register.

The fame of the French Canadian horse, however, has not been confined to the Province of Quebec. Dr. G. J. Fitzgerald, who now lives at London, Ont., brought to the county of Middlesex in the late '60s and early '70s some of the best specimens obtainable. Some of them were sent to Ohio, where, particularly in Cuyahoga county, their descendants are yet to be found. Many of the best of the breed are black and the best of these horses taken to Ontario were of that color.

Rocket and Diamond were blacks, Little Joe Sauvage and Richelieu Tom were bays. Rocket was a phenomenal horse and if you should ask any of the old time farmers well beyond the three score and ten mark in the counties of Middlesex or Huron what was the best general purpose horse he ever saw he would without a moment's hesitation say "Black Rocket."

Dr. Fitzgerald bought this remarkable horse from a farmer near Pointe Caire, a few miles from this city. He was four years old, black as a raven, except for a star in the forehead. He stood about 15.2½ hands high, but was of such massive build that he weighed upward of 1,500 pounds. He was as near perfection in conformation and disposition as could be imagined, and he had the splendid mane and tail of his tribe.

It sounds almost incredible but it is nevertheless true that he could trot a quarter close to a 2.25 gait, and in motion he was something never to be forgotten. He was owned by Dr. Fitzgerald until he was 18 years of age and the day he was sold there wasn't a pimple on his perfect legs. He had been worked in the woods many winters, could handle his cord and a half of green beech or maple on a pung and, although a stallion, could be driven anywhere at any time, single or double, by man, woman or child.

He left his impress so indelibly on the horses of the counties of eastern Ontario that to this day his decendants are known by the characteristics which made their sires famous. Many of them are fast trotters and the dams are highly prized as brood mares.

The experiment of re-establishing the French Canadian breed of horses will be worth while.—American Horseman.

"WINNER" WASHER.

Designed for quick and effective work. Cover to keep in all steam. All Gearing covered. Heavy fly wheel to do the work. Made of Louisiana Red Cypress. Don't be without this machine for another washday. Cost is trifling in comparison to results.

If your dealer cannot supply you with a **Connor Washer & Wringer** write direct. Over 30 different styles to choose from. Get the genuine.

Chamberlain's Colic, Cholera and Diarrhoea Remedy is today the best known medicine in use for the relief and cure of bowel complaints. It cures griping, diarrhoea, dysentery, and should be taken at the first unnatural looseness of the bowels. It is equally valuable for children and adults. It always cures. Sold by all dealers.

CUTS A CLEAN, STRAIGHT FURROW

This is No. 21
FROST & WOOD
Standard Plow
26 Different Styles

Our Plow Reputation is 70 Years Old

Our fame as Plow-Makers has been built on the bed-rock foundation of plow-honesty. Whether you need a plow for prairie-breaking, for soil for light soil, stony ground, sandy loam—no matter what the conditions—Frost & Wood Plows are the ones you can put your faith in. They cut clean, straight furrows, take a good polish, have just the right curve to the mould-board, hard-tempered, strong, rigid—thoroughly dependable. We have a special pamphlet about plows you ought to have. It's free, and tells all about the twenty-six styles of plows we make. We have an agent near you. He'll gladly answer any questions.

POULTRY.

Preparing Poultry For Market.

TIME TO FATTEN.

The most profitable age to fatten poultry is between three and four months old, though birds of almost any age may be fattened. The idea is to have them plump and well fleshed.

FATTENING CRATES.

Chickens for fattening should be placed in crates. These crates are generally made six feet long, sixteen inches wide and twenty inches high, divided into three compartments, each compartment holding four birds. Set the crates on stands four feet from the ground. Each crate may carry a light "V" shaped trough two and a half inches deep. The bottom of the trough is four inches above the bottom of the crate and the upper inside edge two inches from the crate.

FEEDS.

A very palatable and effective ration may be made of two parts of ground oats and one part corn; or, equal parts of ground oats, ground corn and ground buckwheat or two parts flour, two parts ground barley and one part wheat bran, mixed with skim milk, sour milk or butter milk to a thin porridge. A quantity of meat meal, beef scraps and grain should be mixed with the mash on alternate days.

On the first day mix some Epsom Salts in the drinking water, and for a couple of days feed lightly, the food being given twice daily, and after the birds have eaten what they require, troughs should be removed or cleaned. Quantities of fresh water must be supplied constantly, and also grit two or three times per week.

MARKET REQUIREMENTS.

In fattening chickens, the object should be to conform, as nearly as possible, to market requirements. The breast, in shape, should be long and broad, giving the bird a plump appearance. Short legs, indicating the low blocky type, are a good feature. The leg should form as small a proportion of the weight as possible, because the meat is largely composed of sinew, and therefore inferior. The bones should be small and well rounded. About four lbs. is the preferred weight of dressed fatted chickens, and as the gain in live weight made by birds range from one to two pounds per bird during the fattening period, it is never difficult to calculate the amount of work necessary.

FASTING.

A mistake which results in the spoiling of many promising birds is killing them when their crops are full. Green spots of decomposition on the flesh can invariably be traced to the fact that the birds were not fasted. Birds must fast for at least twenty-four hours, preferably thirty-six, before killing, so as to completely empty their crops and intestines. This is a point about which one cannot be too particular.

KILLING.

Never kill by decapitating. This is a disgusting and unsanitary method. The neck invariably crooks upward and stops the flow of blood, causing the formation of clots, which produce coagulation. Furthermore, the exposed portion of the neck leads to early decomposition and spoiling of the flesh.

The simplest and surest method of killing is by cutting through the roof of the mouth by means of a sharp knife. If the operation is correctly performed, death follows instantly, and all blood flows through the mouth from the body.

Hold the bird under the left arm, and with your thumb on the neck force open the mouth. Insert the knife with the right hand, first severing one artery, and then the other, and next pierce the brain, it being necessary to drive the knife through the roof of the mouth towards the top of the head. If the work is done properly, the bird will shiver and give a convulsive flutter—it is paralyzed for the instant, and dead.

PLUCKING.

All birds must be dry plucked. Scalding is not necessary because the appearance of the fowl is destroyed.

To dry pluck is a simple and easy task, the only provision being that all feathers must be removed before the carcass has cooled. Having the bird suspended, head downwards at a convenient height, its back towards the operator, grasp the wings with one hand and pull the long feathers with the other. To remove the wing feathers pull downward quickly. The stiff feathers at the shoulder joints are pulled upward. With the thumb and forefinger around each shank, remove the feathers from the thighs by bringing the hands towards the body. Roll the feathers from the back, using both hands, beginning at the tail and passing down by the wings and around to the breast. Turn the bird and perform the same operation on the other side. Strip the feathers from the neck, leaving a band two and a half inches wide near the head. A bunch of feathers should also be left to cover the leg joints, and the last two small flight feathers, as well as the small feathers on the tip of the wings, should be left on. Pin feathers may be removed with a blunt edged knife.

PLUMPING OR SHAPING.

Shaping a bird means giving it a plump, attractive appearance, in other words, showing it compactly to best advantage. A shaping frame is made by nailing two six-inch by seven-eighth-inch planed boards together at right angles, forming a trough. The trough may be made six feet long and nailed into a frame Have it inclined slightly backwards.

A bird should be shaped as soon as it is plucked. The wings are folded by turning the tips behind the shoulder, and the legs are placed alongside the breast. The bird is forced into the angle of the shaper, breast downward, then covered with paper, and a weight is placed on the back to hold it down. Care should be exercised to shape and cool the birds in as low a temperature as possible, about six to twelve hours usually being sufficient.

B
"Why Don't You Use
Amatite
ROOFING?
It Needs No Painting!"
EVERYTHING about Amatite appeals to the man with common sense. He can see its superiority at once—the *real mineral surface* which never needs painting; the *two layers of Pitch* which is the only imperishable waterproofing known; the two layers of *heavy Tarred Felt*—all these contribute to the popularity of Amatite.
We can make Amatite better and cheaper than anyone else on account of our greater facilities, and consequently we sell it at a surprisingly low figure.
Simply the fact that it *needs no painting* is enough to make a man sit up and take notice—especially the man who has spent dollars and days in painting and repainting his smooth-surfaced roofings.

PACKING DRESSED FOWLS.

Poultry must be packed neatly and carefully in clean boxes or barrels. Line the inside of the packing case with parchment paper—never use newspaper—and allow a good quantity to extend over the edges to be used as a top covering. In packing the first row of birds are laid with backs downward, and the second row are laid with breasts and heads extended across between the birds of the first row.

The name and address of the shipper, the number of birds, kind and weight should be plainly marked across the top of the box.

FATTENING DUCKS.

Keep ducks in small pens. Do not permit them to swim; feed them a good food in sloppy condition; have plenty of drinking water at hand, for a duck will take all the food it can and then clean the passage to the crop by drinking freely, when it will again return to the food, and continue to eat until it can eat no more. Food must not be left before ducks continuously, but should be fed regularly. If the above instructions are followed ducks will be in prime condition in ten days or less.

FATTENING GEESE.

Geese will not stand confinement, and if placed in a limited run and not being permitted to swim, in fact, given practically the same conditions as ducks, they will show like results.

FATTENING TURKEYS.

The best way to keep turkeys from roaming is to give them a small, rich range, such as clover and fed a rich range, such as clover and feed a and night.

The instructions given above with reference to the killing, plucking and shaping of chickens are equally applicable in the case of turkeys, ducks and geese.

SHIPPING LIVE POULTRY.

Great quantities of poultry are purchased alive by our agents and this manner of selling is becoming general. Good quality, well fatted, live poultry will always bring a high price. Live poultry is bought by the pound, and the method is fairer to both the raiser and the purchaser because the value placed upon the fowl is then not approximate but true.

Shipping crates for live poultry should be roomy and comfortable, constructed of light material and yet strong enough to stand a certain amount of rough usage. If large crates are used, these should be partitioned so that the birds will not be thrown against each other towards the sides or ends. Suffocation and death very often results from the tilting of the open coops, which allow the birds to fall on top of each other.

In making up a crate of live poultry for shipment, it is best to place birds of a uniform size in each, and never ship old and young stock together, nor birds of different sexes. Diseased or emaciated stock must never, under any consideration, be shipped with a bunch of live poultry. Such a practice is malicious and dishonest. The person who is guilty of it is injuring his reputation. Furthermore, very often a contagious disease will spread through the whole shipment. All diseased birds will be culled.

Shipper should always place his name on the crate together with the number and weight of the birds contained in it.—From instructions sent out by the Poultry Yards of Canada, Limited, Pembroke, Ont.

THE FARM HOME

This Department is now being edited by a very competent lady, who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

Mrs. Bowen's Investment.

By Alice B. Haven.

Store is no sore.—Old Proverb.

Mrs. Bowen stood in her kitchen and pondered, in rather a disconsolate mood. It was Monday morning in November, a large wash in progress, Hannah—the "help"—cross because of the extra tablecloths and sheets, occasioned by two unexpected visitors the week before. There was a quilt, too, that Johnny had muddied with unlawful climbing on the bed, and so get an apple on the bureau, and Kate had slipped down and ruined Monday's clean petticoats, so that there were two sets for her in the wash. The tin boiler bubbled and upheaved, so did Hannah's wrath, with every garment that she plunged into her tub, the same slow, determined, spiteful ebullition.

Mrs. Bowen was making up her mind on the dinner question. There was cold meat, of course, from Sunday's roast; but cold meat needs trimmings to render it acceptable to mankind in general, and besides Mr. Bowen, there was his mother who was twice as particular, not from a desire to be disagreeable, but because, as an invalid, her appetite was sickly and variable.

Now it is comparatively easy to walk into a good market, with a boy behind you to carry the basket and no compunctions as to prices, and lay out your dinner; but when your only market is a grocery, where they decline sending home parcels, and it is not the habit of the place in which you live for a housekeeper in respectable circumstances to carry pots of butter and a bunch of turnips, say, through the streets, it is a little puzzling to arrange a meal to the satisfaction of yourself and anybody else, especially when one dollar has to do the duty of five.

"I think," said Mrs. Bowen, slowly, "I think, Hannah, we will have some potatoes and, and—let me see, well, turnips."

"The potatoes is all out, ma'am—only two turnips and a half left from Saturday. I don't see why squash, and them cold baked beans, warmed up, won't do."

"Mother Bowen never eats squash, you know, Hannah, and we had squash yesterday. I must make some change."

"I can't stop and go and dress, no how!" And Hannah plunged into her tub after a batch of dinner aprons, and rubbed them to within a thread of their lives.

"Why can't you go as you are?" suggested Mrs. Bowen mildly. "Put on a dry apron, and unpin your frock."

"I'd like to see myself going into the streets looking like this! Well, I would!"

"Dear me, Hannah," said Mrs. Bowen, driven beyond the limit of caution by this determined resistance, "who do you suppose ever looked at you?"

"'Nuff sight better people than comes to this house!" And the "help" wrung the suds from her hands with a jerk, to poke down the bubbling, upheaved garments in the boiler, most vigorously. "S'pose I'm going by the carpenter's shop in an old wash-dress? No I ain't—nor the blacksmith's, either, with all them fellers standing 'round. If I've got to go, I've got to dress—that's the hull of it!"

"Well, do hurry, Hannah, for it's a bad drying day, any how; I don't believe you will get the colored clothes out before it rains. A peck of potatoes and a half a peck of turnips—oh, and, Hannah, some carrots to stew the meat with. Mother Bowen cannot eat cold mutton. Oh, and, Hannah, there's no whole pepper for the stew either; and get a paper of cinnamon; there was none when I made those apple pies on Saturday."

Hannah's toilet was not readily accomplished. Mrs. Bowen looked at the clock, and poked the clothes, and made a faint essay at the vacant washtub. It took her handmaid just a quarter of an hour to prepare herself to face the carpenter's shop; it was twenty minutes more before she returned—half past ten. In the mean time Mrs. Bowen thought to save time by getting her pudding ready—a tapioca-pudding, as Mother Bowen considered it "nourishing;" but there were no eggs in the house, and Hannah was out of call. What could be made without eggs? Baked Indian pudding? But that required so much milk—more than could be spared. Apple and tapioca? There was not time for it. Apple dumplings would take up room on the stove, and washing days there was none to spare. If she only had those eggs; so many things could be made with eggs, nothing, it seemed to her, without them. The whole twenty minutes was lost in opening boxes that were either empty or nearly so, and ransacking her brain and her cook book for something that could be made with no eggs and very little sugar, for that last seven pounds of brown sugar seemed to last no time at all.

"Might have kept up the fire, at all events," muttered Hannah, setting down the basket with a thump.

Sure enough the fire was "way down;" the boiler had to come off, and it was eleven o'clock before steam was got up again, and Hannah once more arrayed for her post.

"Where's the carrots, Eliza? I don't find any in the stew," inquired Mr. Bowen, when dinner was at last served, and his wife, who had been cook, sat down, flushed and worried, for it was late and the children clamorously hungry.

"Hannah forgot to get any at the store, and I could not spare her to go back again."

"Humph! I'd like to see one of my 'prentices forgetting orders. Nobody ever heard of a mutton stew without carrots. Miserable potatoes too."

"Yes, there was a great deal of waste in them; and Mr. Bennet charges outrageously. Hannah didn't bring home a cent of change. I don't think he treats us well; I wouldn't deal with him any longer."

"Must, as long as he does with me; you ought to send him word. Turnips! I thought you were going to have cabbage."

"Cabbage is worse than turnips, James," said Mrs. Bowen, senior, feebly, "and the potatoes are so watery. I don't see anything I can eat. No, thank you, I'll wait for the pudding."

"I'm very sorry," Mrs. Bowen began. "Hush, Kate! Mr. Bowen, please speak to those children. I couldn't make the pudding, mother."

The old lady pushed away her plate with an injured look. "Its of no consequence; I can do just as well without eating. When people are too old to work, they hadn't ought to eat, I suppose. Don't never trouble yourself to get anything for me."

"I should think, Eliza, that mother might have the little she wants. I can do without myself, but my mother isn't going to, so long as she lives under my roof."

Feeling all the injustice of the implied reproach from both, and knowing, moreover, how hard she had toiled, Hannah being "as contrary as possible" after her interruption, an angry reply rose to Mrs. Bowen's lips; but she caught the quick eyes of both the children raised to hers, Kate defiantly ready to take sides against "grandmother," whose feebleness sadly interfered with the noisy play of herself and her school companions. "They must not see us quarrel," thought she, remembering the miseries of her own childhood, and how much of filial respect was lost by her from this very cause but her manner was cold and repellant, and the first part of the meal passed in silence.

Kate sprang up willingly enough to help remove the meat and vegetables. She was always ready for dessert, and followed her mother into the kitchen to find out what it was to be. "Boiled rice and molasses! Is that all?"

"I'm so sick of rice, it seems to me I could never taste another mouthful," groaned Mother Bowen, from the next room.

"It's too bad, mother," responded her son, warmly; "I don't see what Eliza was thinking about. If that's all there is"—and he pushed his chair from the table— "I'll be off. I should think Eliza, you might contrive something a little different."

Mrs. Bowen felt very much like breaking down into a cry, as her husband took his hat and departed for the store, without another word, and his mother settled back into her rocking chair and drew out her knitting work. This was the result of a morning's work and contrivance to say nothing of Hannah's impertinent muttering; and yet, scarce as help was, she could not dispense with so neat and active a girl for one fault of temper, especially as Mother Bowen needed so much waiting on."

"Old people's a dreadful trouble, I know, Eliza." And the trembling fingers shook more than ever, as they untangled a knot in the yarn. "I never wanted to outlive my usefulness—never. I'm as great a trial to myself as to anyone else though. It's very hard to feel that you're in everybody's way, and no use to nobody; I hope you'll never live to be old and feel it; but it's likely you will, though, it's likely you will, and then you'll reflect—"

"I think rice and boiled molasses is first rate, grandma? Hadn't you better have a plateful? Give me some more, mother." And Master John "backed up his plate" as he said this, so did Kate, for all her disappointment; and Mrs. Bowen, refilling them, thought what a blessing strength and a healthy appetite was, and then more particularly of the worn-out body that made a querulous mind.

"It was too bad, mother, when you had set your heart on the pudding," she said. "I was as much disappointed as you was; but it was washing day you know, and I did not find out about the eggs until Hannah was gone, and it takes her so long to go to the grocery. Shan't I go and make you a cup of tea and some milk toast?"—for, doing without the pudding milk was fortunately at hand.

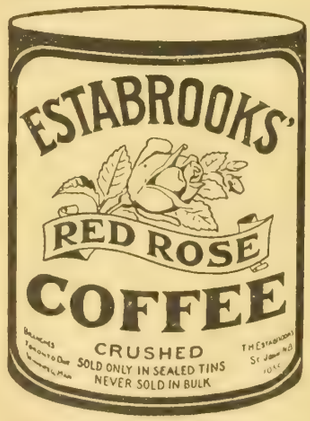
"I don't care if I do have a cup of tea; I feel dreadful gone, somehow. But don't trouble yourself to wait on me; eat your own dinner, eat your own dinner; when people get old and useless, they can't expect to be waited on."

Mrs. Bowen's dinner had been light enough. It was often so of late. What with looking to see if Mr. Bowen liked his, and Mother Bowen could eat hers, and that the children were not soiling the tablecloth so that Hannah would be up in arms, and keeping one ear in the kitchen for breakages and the like, she forgot that no one offered to help her, or to ask to be helped, if she happened to notice that her plate was empty.

As for Mr. Bowen, he was as much absorbed in business as any Wall Street financier, or Broadway jobber. The town was growing since the Erie railway had been finished, and trade grew with it. Of late, too he had commenced manufacturing boots and shoes for the Southern market. He was not above work himself, although he had a shop full of apprentices and journeymen; and then, too, his trips to the city for materials added the little change and stimulus that helped him to the brisk, bustling way which told you in five minutes that he was a money-making man. "Yes," he remarked that very afternoon, to his friend, Mr. Gerry, who often dropped in to bask in the genial heat of the great cylinder stove, on the very comfortable lounge provided for lady customers—"yes, Gerry, I don't think I'd change with any man I know. I don't believe there's a man outside of New York that's got better credit than I have in the Swamp, though I say it myself. There's Jones & Mudford, one of the oldest firms in the city. 'Come right straight to us,' says Mr. Jones, 'always, Mr. Bowen, and we'll do as well by you as anybody can. We don't want your money, we want your custom; that's what we want; I'd like to find a few more of the same sort.' Now, that's what I call gratifying—ha, Gerry?"

"Very," responded Mr. Gerry, elevating his feet to the fender of the glowing cylinder, and his eyes to the arabesque of boots and shoes on the wall overhead.

There is a convenience in using Estabrooks' Coffee because you can buy it in nearly every store and the quality is the same wherever you buy it. The double sealed tin keeps it in perfect condition until you get it. Buy Estabrooks' Coffee and you are sure of coffee at its best.



Sold only in 1 and ½ lb. tins.

SEALED TENDERS addressed to the undersigned and endorsed "Tender for Extension to Breakwater at Dipper Harbour, N. B.," will be received at this office until 4.00 P. M., on Monday, September 26, 1910, for the construction of an Extension to the Breakwater at Dipper Harbor, St. John County, N. B.

Plans, specification and form of contract can be seen and forms of tender obtained at this Department and at the offices of E. T. P. Shewen, Esq., District Engineer, St. John, N. B. Geoffrey Stead, Esq., District Engineer, Chatham, N. B., and on Application to the Postmaster at Dipper Harbour.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures, stating their occupations and places of residence. In the case of firms, the actual signature, the nature of the occupation, and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Honorable the Minister of Public Works, for the sum of two thousand one hundred ($2,100.00), dollars, which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By order,
R. C. DESROCHERS,
Secretary.

Department of Public Works,
Ottawa, August 24th, 1910.

Newspapapers will not be paid for this advertisement if they insert it without authority from the Department.

"Then, too, there's my wife; many a man's been ruined by his wife. Mine don't spend one cent on nonsense; don't catch her with flounces and furbelows. Every dollar goes right straight into my business; that's the secret of it, you see. I get the best of stock, and plenty of it, and then I can afford to work reasonable; why, there isn't another man in Plumville can begin to manufacture alongside of me. There's Toby, now—"

"Oh, he couldn't lay a straw in your path; he never has what a man wants. I see him coming out here, every now and then, with a lot of findings."

"That's it, you see. He don't get ahead enough to buy his stock to good advantage; and half the time he gets shaved by some of those outside fellows he deals with. Shiftless kind of man. Runs to New York twice as often as I do, and spends just so much time and money.

This little conversation having taken place in the lull of the day's work, just before teatime, Mr. Bowen proceeded home to partake of that social meal, in the complacent mood which is the result of recounting one's successful achievements, and quite ready to overlook the failure at dinner. He expected at least, hot biscuit to atone for it, but, on the contrary, he found only baker's bread, and he hated baker's bread.

"Flour out, hey? Seems to me fourteen pounds of flour ought to last longer than all this comes to! Not much butter to help it down with, either!"

"It is all there was in the house, and Johnny did not get home from school in time to send to the grocery,' said Mrs. Bowen, patiently.

"You know you never like to have us borrow."

"No, borrow, no! Go without, twice over; but, I must say, I never saw such providing in my life."

"I had enough, I thought, but Mrs. Toby sent in to get enough for tea, and I never like to refuse her, you know; so I told Hannah to let her have it, without going to see."

"There's a family that's always borrowing; she must be as shiftless as her husband."

"The Toby's never did get ahead," remarked Mother Bowen. "'Tain't in them. Old 'Lias Toby, now, started in business the same time with your father, and wasn't worth a cent when he died. Some folks just live from hand to mouth.

"A pretty miserable way of living." And reflections of his own forethought and freehandedness supplied the place of sauce to the scanty tea-table; though John and Kate, whose imaginations, however active, could not delude them on this subject, demanded the molasses pitcher, to make up deficiencies.

"Not a rag of clothes dry enough to iron," Hannah stated, encouragingly, as Mrs. Bowen went to inspect the progress of affairs, next morning. "I hung them tablecloths up in the garret and them starched things 'round the stove; jist look at 'em, might as well be right out of the tub this minute. That comes of leaving clothes in the middle of the day to run to the store."

"I know it, Hannah, but we must do the best we can. There's some one knocking; go to the door, for mother never would hear, and Kate has gone to school."

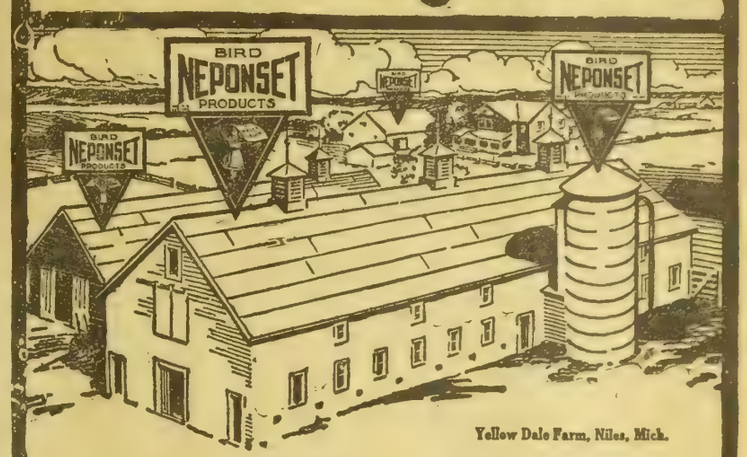
Mrs. Bowen "felt" the damp garments one by one, without the least brightening of the prospect. Hannah returned presently, ushering in a little girl, with a deep cape bonnet, and a quantity of school books piled up on her arm.

"Mother sends her compliments, Miss Bowen, and, if its convenient, she'll come and take tea with you. Jane's gone off again," she added by way of explanation, entirely on her own account, and I heard mother say to father, that when we didn't have a girl was a good time to go a visiting, and Sallie and me could come too."

Now, it was not in the least "convenient," with the ironing so far behind. Usually, the clothes were all folded down on Monday night, ready to commence by nine o'clock on Tuesday, when Mrs. Bowen did the fine things and her husband's shirts; but if she should say so, Mrs. Gerry would take mortal offence, especially in the present posture of affairs.

(Continued next issue.)

Are You Going to Build?



Yellow Dale Farm, Niles, Mich.

Buy Your Roofing on *Proof*—Not Claim

The one and only basis on which you can afford to choose your roofing is that of *proof*—proof of what it *has done*, not claims of what it *may* do.

Do not be deceived by extravagant claims and high-sounding guarantees. They are merely made for lack of proofs of what a roofing has done. Insist upon seeing roofs that have given satisfaction for years.

We can point out roofs of proof, right near you, where Neponset PAROID Roofing has lasted as long as the highest-grade shingles. It has been on Government buildings, dairy barns, stables, poultry buildings and railroad and industrial buildings everywhere for over a decade. We have been in one line of business for over a century and the experience gained in all that time is back of

NEPONSET PAROID ROOFING

NEPONSET Roofings enable you to choose the roofing that best meets your needs. There are different roofings for different types of buildings.

NEPONSET PAROID Roofing for barns and general farm buildings. Slate in color. Does not taint rain water. Resists fire.

For such poultry buildings, brooder houses, sheds and temporary buildings as require low-cost roofing, you will find that NEPONSET RED-ROPE Roofing lasts three times longer than tarred felts.

NEPONSET PROSLATE Roofing and Siding for residences and all buildings requiring an artistic roof or siding. Rich-brown in color, much more attractive and lasting than shingles.

Each roll of Bird NEPONSET Roofing contains directions for laying and complete fixtures, including square metal caps.

NEPONSET WATERPROOF Building Paper under clapboards, shingles, slate, metal, etc., insulates against exterior cold, heat and dampness. It costs little and cuts the fuel bill one-third every winter.

These are facts and not claims—write us and we will prove every statement

Consult Our Building Counsel Department—tell us the nature of the buildings you propose to erect or repair, and we'll send you the Bird NEPONSET Book which treats your special case. There are dealers in Bird NEPONSET Products everywhere. If you do not know the one in your locality, write us and we'll tell you.

Flesh Flies.

When the sheep's wool becomes filthy and the skin irritated an ideal condition is made for the work of the maggot fly. And when the maggots get a start they create a more and more friendly harbor for their kind as they work and increase in numbers under the wool. A sheep infected with maggots is a most pitiful sight, helpless against the parasites eating out its flesh until the sheep dies, its life gnawed out in a most cruel manner. For the sake of humanity if for no other reason sheep should be saved from such suffering. These flies can do no damage if not given a suitable place to lay their eggs. Sheep should be watched carefully, especially in warm damp weather, and dirty tag-locks or other filth clipped off and a little tar dabbed on if the skin is chafed. These maggots also get in their work under rams' horns. Indeed a ram with heavy horns lying close to his head will hardly pass through a summer without infection unless the flies are kept away by putting some tar on the rams' head.

An infected sheep can be told by the fact that it refuses to eat, stands with its head down and most often by itself, and stamps its feet or jerks its head exactly as irritation by maggots would lead one to expect. The remedy is simple. Cut away the wool close. Clean out all maggots, using turpentine to wash them out. Smear the place thoroughly with tar. Then keep watch of the sheep to see that the flies do not again start in the same place. Thoroughness in cleaning out the parasites is essential, for one left in will start the damage all over.—National Stockman.

Breads and Raised Doughs.

Too much sugar will make the dough so dense that it cannot expand rapidly; an excess of flour or fats will have the same effect. The three most important points to consider where yeast is used, are, first, the time one can allow for the risings; second, the temperature; and third, the quantity of yeast, for where one is diminished the others should be increased.

Too much salt in the sponge will prevent the growth of the yeast. We know that yeast is a plant, and any plant life must be given the proper conditions for its development, if we desire the best results. A good fresh yeast cake should be hard and break like cheese, if soft, it is bad.

Yeast breads are extremely unwholesome if insufficiently baked. Unless the yeast is completely killed in the baking, it goes on fermenting, and this fermentation continues in the stomach, causing very serious disorders. Toast and zwieback are easily digested, because of the double baking they receive. There is no reason why hot bread should not be quite as wholesome and digestible as cold, provided it is thoroughly baked. It is not the temperature of the bread, but its condition, that affects us. Hot bread disagrees with many persons only because they eat it more rapidly; it is softer and is swallowed before being thoroughly masticated and insalivated. A stale,

I Present to You a "Health Belt Man"

He is 55 Years "Young."

Yes, 55 years young; not 55 old for My Health Belt poured vitality into his blood, nerves and tissue until

HIS VIGOR WAS RESTORED

My marvellous HEALTH BELT is a Wizard Worker, a mechanical self-treatment of the highest therapeutic value. It stands by you and never abandons its task until you are brought back to a state of vigorous Manhood, without an ache, pain or weakness. No drugs, no dieting, no restrictions of any sort, excepting that all dissipation must cease. Worn during the time you are sleeping, it opens its flood gates and drives a great, soft, warm stream of electric-vitality into your blood, nerve and weakened organs throughout the entire night; you sleep better for its use; it cures forever the weakness in your back; it seeks out and expels from your system all rheumatic pains. The electro-suspensory attachment is there for a purpose; it is the strong feature of my Health Belt, and delivers the electro-vitality to the parts most needing it. Courage, ambition,

and a new view of life, with full self-confidence, surely result. It makes you young and keeps you young, with the fire and vigor of the biggest, fullest blooded man you ever saw. The "HEALTH BELT MAN" cannot grow old, for he knows the secret of perpetual youth. It will place you in the "feeling fine class." "I am a man again, thanks to your wonder-working Health Belt. Use my name as you see fit." So writes C. L. Snell, of Middleport, N. Y. So have said thousands before him.

YOU CAN PAY WHEN CURED.

If you're sceptical I'll prove it first. I'll take all the risk by letting you have the Belt on Free Trial, not to be paid for until cured. Send it back if it does't do the work.

These Wonder Books are

HIS FACE AND NECK WERE COVERED WITH PIMPLES

Pimples are caused by bad blood. There is only one way to get rid of them, outward applications are no good, and that is to get at the seat of the trouble, by using a good reliable blood medicine.

Burdock Blood Bitters has been on the market for over 30 years, and is one of the most reliable blood cleansers procurable.

It removes all the poisonous matter from the blood, and leaves a beautiful clear complexion.

Mr. Philip S. Cobb, Crapaud, P.E.I., writes: "About a year ago my neck and face were entirely covered with pimples, and having tried nearly every medicine I could think of, and getting no relief, I at last thought of Burdock Blood Bitters and decided to try a bottle.

"After the first bottle was done the pimples were almost gone, so I got another and after finishing it they entirely disappeared, and I now have a beautiful clear complexion free from all ailments of the skin. To all persons troubled with pimples or any other skin diseases I highly recommend Burdock Blood Bitters. I feel quite sure it will cure them."

MAIL CONTRACT.

SEALED TENDERS addressed to the Postmaster General, will be received at Ottawa until noon, on Friday, 14th October, 1910, for the conveyance of His Majesty's Mails, on a proposed Contract for four years 3 times per week each way between Newtown and Sussex from the first of January next.

Printed notices containing further information as to conditions of proposed Contract may be seen and blank forms of Tender may be obtained at the Post Office Newtown, Sussex & route offices and at the Office of the Post Office Inspector at St. John.

G. C. ANDERSON,
Superintendent
POST OFFICE DEPARTMENT,
MAIL SERVICE BRANCH,
Ottawa, 27th August, 1910.

Your complexion as well as your temper is rendered miserable by a disordered liver. By taking Chamberlain's Stomach and Liver Tablets you can improve both. Sold by all dealers.

hard bread has to be chewed before one can swallow it; therefore, it has won the undeserved reputation of superior wholesomeness. The juices in the saliva digest starches, hence the importance of thorough mastication.

After the dough has risen sufficiently it should be put in an oven that is hot enough to kill the yeast germ quickly, so as to prevent further rising, or souring of bread.

Continued kneading of dough is unnecessary. Some kneading makes the bread of better grain and quality, but as the object of kneading is to redistribute the air bubbles through the dough, as soon as that is accomplished, further work is a waste of energy.

Matching Farm Horses.

Horses on farms are so frequently worked in pairs that it is very necessary that they should be well matched. By this it is not meant that the team should be closely alike in color, size and general appearance. It is desirable that they should be so, but that is only one and by no means the most important part of the matching. It requires a good deal of skill and judgment to bring together a pair of horses that resemble each other in all characteristics sufficiently to work in harmony, and action comes first in this connection. Style is required in the action of any class of horse, and a team, each of which stands up to the bit in about the same way, is attractive to buyers, and pleasing to the man who drives it.

A team ill-matched in regard to action, strength and staying powers is a liberal source of irritation, no matter how nearly alike in color the horses may be. Proper action—that is, strong clean, vigorous movement of feet and legs—is highly desirable, and if it can be combined with general conformation and color, so much the better. Size, to a certain extent, may be sacrificed for strength and conformation, but only within certain limits.—Ex.

How to Whitewash Stables.

The stables should be well whitewashed once or twice during the summer. This can be done conveniently on a rainy day. With an ordinary spray pump a large stable should be whitewashed in a day with one man to pump and another to hold the nozzle. A little crude carbolic acid mixed with the wash, although slightly objectionable, because it gives a slightly yellow tinge to the lime, is a good disinfectant. Sweep down all cobwebs and thoroughly scrape the dirt out of every corner, then spray thoroughly ceilings, walls and floors.

The wash has to be made thinner than when it is to be applied with a brush. Use good lime and strain it into the spray tank, otherwise the nozzle will be clogged by particles of solid matter.

To Change the Atmosphere.

If the odors from cooking are unpleasant in any room of the house, try the following, which has been found to act like a charm.

Put in a bowl-shaped vessel about ten cents' worth of "salts," such as is used in "smelling salts," and cover, either with alcohol or ammonia. Keep this covered when not in use, as the liquid evaporates.

Such a bowl put into a smoking-room or "den" will make the atmosphere breathable by absorbing or destroying the odor of smoke and tobacco. One may cook onions or cabbage without the unpleasantness, and the smoker need not fear to sit in the "best room" and smoke.

Amsterdam, New York. M. B.

The warmest friends of Red Rose Tea are those who have tried some other brand said to be "as good as Red Rose" and for which they paid the same price. Very easy to say a thing is "as good" but not so easy to "make good." 66

Filling the Floor Cracks.

If you have more money than time putty is a good filling, and it must be beaten until perfectly free from lumps or grains, and quite soft, pressing it well into the cracks and smoothing it even with the surface of the boards. If money is lacking, saw-dust and glue is a good filler, but the cheapest is a good flour paste in which soft old newspaper is soaked, making the mixture quite thick with the paper pulp, pressing it in the cracks with a knife blade and smoothing the top even with the surface. Any of these fillers will dry hard, and may be painted over satisfactorily. For the saw-dust and glue, dissolve one pound of common glue in two gallons of water; when fully dissolved, stir in enough fine sawdust to make a paste; the paste may be colored to match the color of the floor. Finely shredded paper should be soaked in hot flour paste until the pulp is as thick as ordinary putty. Nail holes, and other rough places, cracks, crevices where insects may hide, should be stopped with the filling.

"AUNT SALINA'S WASH DAY PHILOSOPHY"

This little book is chock-full of [illegible] secrets invaluable in the washing of clothes, and should be in every home.

It tells how to wash fancy prints and other fabrics without the use of acids.

It tells how to clean the daintiest lingerie without injury.

It tells how to wash woolen material thoroughly without shrinking it one particle.

It tells how to make hard water soft and save half the soap.

It tells how to remove the drudgery from wash day, and a host of other things that every woman who washes clothes should know.

Send us your name on a postal and we will send you a copy FREE.

CUMMER - DOWSWELL Limited HAMILTON, ONT.

Do it Now.

When you've got a job to do,
Do it now!
If it's one you wish was through,
Do it now!
If you're sure the job's your own,
Don't hem and haw and groan—
Do it now!
Don't put off a bit of work,
Do it now!
It doesn't pay to shirk,
Do it now!
If you want to fill a place,
And be useful to the race,
Just get up and take a brace,
Do it now!
Don't linger by the way,
Do it now!
You'll lose if you delay,
Do it now!
If the other felows wait,
Or postpone until it's late,
You hit up a faster gait—
Do it now!

Clean and Sanitary Dusting.

When people, for the first time, see me cleaning my rooms, they invariably express surprise at my methods of dusting, which unlike the ordinary method, I consider clean and sanitary.

Instead of using the usual sort of duster, I use a damp cloth—preferably some soft stuff, such as a piece of an old gauze undervest or a worn napkin. The cloth is soaked in tepid water, then wrung absolutely dry—so dry that not another drop of water can be wrung from it. With a cloth of this sort the dust is quickly lifted from woodwork and furniture, without being scattered over the floor in the process. When the duster is dirty it is washed out, and again wrung dry.

It is essential that the cloth be wrung perfectly dry as often as it is put in the water; otherwise it will streak the furniture and leave damp surfaces to catch more dust. This method of dusting is employed in hospitals to prevent the dust flying about, to be breathed by the patients, and is the sanitary method of dusting the home as well.

Freeport, Long Island. M. S.

Preserving Measurements.

The young housekeeper venturing on her first preserving may like to know that: Six boxes of strawberries will yield five pint jars of jam; five boxes of currants will yield nine glasses of jelly; six pounds of peaches will yield eight pint jars of preserves; seven pounds of peaches will yield fifteen glasses of marmalade; one peck of quinces will yield twenty-one glasses of jelly; four pounds of plums will yield five pint jars of preserves; four quarts of crab apples measured after cutting small, will yield ten glasses of jelly.

An Arab Saying.

Remember, three things come not back;
The arrow sent upon its track—
It will not swerve; it will not stay
Its speed; it flies to wound or slay.

The spoken words so soon forgot
By thee; but it has perished not;
In other hearts 'tis living still,
And doing work for good or ill.

And the lost opportunity,
That cometh back no more to thee,

Removing Sticky Fly Paper.

I, too, had troubles with sticky fly paper and found that clear alcohol will do wonders to remove it from the children's hair, white waists, silk or wool goods. Use it like water to wash the spots with and you can hardly ever find the place again. I use it as soon as possible after the accident happens as it seems to do the work easier. There is a kind of sticky fly paper made purposely to hang up out of harm's way. Let me know your success with the alcohol.—Lillian.

To Utilize Stale Bread.

Do not throw the scraps of bread into the garbage can or swill barrel. Do not let the scraps mildew. Take stale bread and put in water to soak over night. Mash well next morning, add a little flour, salt, a little sugar, three eggs, a pinch of soda and stir all well together; have your pan well greased, and hot, and with a spoon dipped in water, lilt the stiff batter out by spoonfuls, dropping into the hot pan, and bake immediately in a rather hot oven. This will make excellent biscuits. Or the scraps may be used in batter cakes, or in a dish of tomatoes, or rolled and used on top of meats.

Chocolate Cake.

1 cup sugar, 1 egg, 2 tablespoons cocoa, or 2 squares chocolate grated or melted, ½ cup shortening, ½ cup sour milk, ½ teaspoon soda, 1 teaspton vanilla, 1 cup flour (rounding.) Last, stir in ½ cup boiling water. Bake in moderate oven. Reliable.

A cure for Insomnia.

A excellent cure for insomnia, I found, is to bathe the feet in cold water every night before retiring.

If one awakens during the night, and begins to think, get up and plunge the feet in cold water, dry them, go back to bed, and one will go to sleep like a baby. That was my experience after weeks of insomnia.—G. N. McC., Avalon, Pennsylvania.

The fading of colored articles is due often, not to the washing, but to the ironing. Too hot irons are used directly on the material, and this will more quickly fade delicate colors than any amount of washing. The effect is even worse than strong sunlight. Be sure that the article is evenly dampened and that the iron is only hot enough to smooth the wrinkles properly by firm, even pressure and you will have no more trouble from fading. Skirts must never be ironed across the gores, but up and down; otherwise the fit of the garment is ruined.

Not a minute should be lost when a child shows symptoms of croup. Chamberlain's Cough Remedy given as soon as the child becomes hoarse, or even after the croupy cough appears, will prevent the attack. Sold by all dealers.

The Full Percentage of Cream

Getting the full percentage of cream from milk depends as much upon the oil used to lubricate the separator as upon the separator itself. Gummy oil will cut the fine bearings of your machine, spoil its balance and waste good cream in the skim-milk pail.

STANDARD Hand Separator Oil

never gums, never rusts, never corrodes. It feeds freely into the closest bearings and insures the perfect lubrication that is essential to the free spinning of the bowl and the complete separation of cream from milk. It lessens the driving effort and lengthens the life of your separator.

One gallon cans. All dealers. Or write to

The Imperial Oil Company, Limited

Farm Problems.

How to Destroy Wire Worms.

The way to destroy wire worms is to plow the ground as soon as the grass has been cut. The field should then be kept perfectly clean by cultivating and harrowing it once a week. The second year of this practice will kill every wire worm, it makes no difference how thick they are. If the land is clear of couch grass, one will not need to harrow so often.

One season is not sufficient time to kill the wire worms, as they can exist on the dead roots of the grass; but the second year fixes them all right.

It is worthy of special mention that after spending over $2,000 worth of the hardest kind of labor and then to fail, that after the methods I now follow, it costs me only about $5.00 a year to kill the couch grass, and to clean out the wire worms. I can show my fields today clear of these pests.—Farmer.

Level the Colt's Feet.

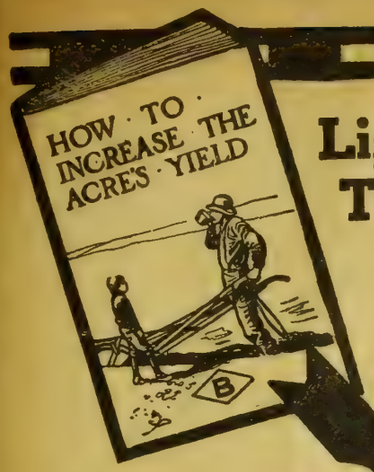
The feet of foals frequently need leveling to prevent an abnormal development of the legs as a result of unequal wear of the hoofs. Many foals stand badly at first and if they are slow in gaining a correct position of the legs the hoofs may become worn in such a way as to prevent a proper standing position or a straight form of action, says Breeders' Gazette. Leveling the feet acts both as prevention and cure. If prevents a breakage, or other cause of rapid wearing away of any part of the hoof, from throwing the weight on the wrong part of the joints. Even if the foal is born with a natural tendency to stand wrong, as with the feet too wide apart or too close together or pigeon-toed, such a tendency may be gradually corrected in large part by keeping the feet level. A colt that stands pigeon-toed, for example, wears off the outside wall of the hoof faster than the inside and the more that condition develops the worse the tendency to stand wrong becomes. By rasping off the inner wall to correspond with or even slightly to exceed the wear of the other side, the foot will be thrown more nearly into line as it strikes the ground. While the leg bones and joints are growing they are susceptible to the persistent pressure from one angle or another and grow toward a correct position or away from it according to the condition of the feet. A level foot induces the colt to assume a correct position of the leg. As an example of the marked effect of the pressure on the joints from shortening one wall or the other of the hoof, work horses with lameness and symptoms of spavin have frequently been made to go sound simply by taking half an inch off of the inner wall of the hoof, thus throwing the concassion onto the outside of the hock joint. If colt's hoofs are kept fairly short at the toes, with the inner and outer walls of equal length, the foot will develop as nearly a correct shape as it can be induced to take and the limbs as well will be safeguarded against deformity. —Maine Farmer.

Sulphur for Sheep.

A sheep keeper writes as follows: I keep at present 100 breeding ewes For the past three years, except when the weather is wet, I have kept before my sheep a mixture of salt and sulphur—one-fifth sulphur and four-fifths salt. This is kept in troughs in the pasture, and in winter in the sheep barns. The result is that I have but little trouble with ticks and have never bothered with stomach worms in the flock. I have used no other medicine.

Weeds a Common Enemy of Production.

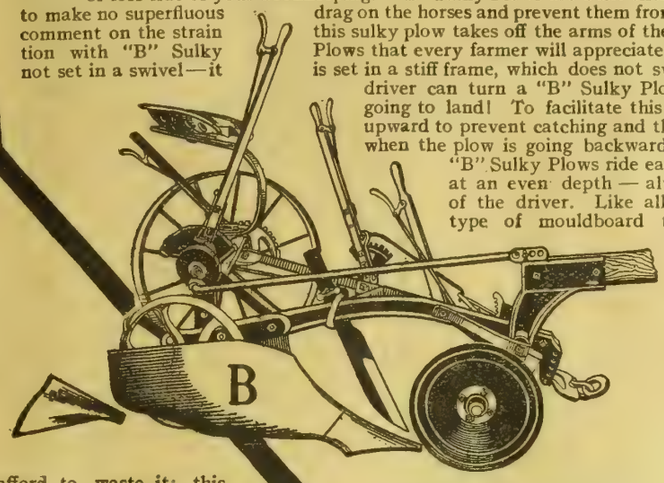
Spraying with sulphate of iron and sulphate of copper, as a means of eradicating weeds, can be said to hardly more than check their growth. The spray destroys wild mustard plants and the leaves of kinghead and Canada thistle if applied before the plants are in bloom, with a machine that will develop one hundred to one hundred and twenty pounds pressure, and through nozzles which make a mist-like spray. Sprinkling with the iron sulphate solution has practically no effect. The sulphates mentioned are inexpensive chemicals. The machinery with which to spray a field



Light Weight Combined With Strength Makes This Plow Stand For Profit On The Farm

WEIGHT and strength are the two essentials in a sulky plow—the strength is needed to stand the wear and tear, of course, and on the weight depends to a large extent whether the plow is to stand on the profit or loss side of your bookkeeping. "B" Sulky Plows are built extra strong for heavy work and still light enough to make no superfluous drag on the horses and prevent them from covering the ground they should in a day. To comment on the strain this sulky plow takes off the arms of the driver is unnecessary. One point in connection with "B" Sulky Plows that every farmer will appreciate is the action of the rear wheel. This wheel is not set in a swivel—it is set in a stiff frame, which does not swing to right or left. The result is that the driver can turn a "B" Sulky Plow around backward—and know where he is going to land! To facilitate this back-up, the rear of the sole is also rounded upward to prevent catching and the colter also tilts automatically on the beam when the plow is going backward. It does not catch in roots and stones.

"B" Sulky Plows ride easily, cut evenly, turn a good furrow, and work at an even depth — always. They are always under full control of the driver. Like all "B" Plows, they are fitted with the exact type of mouldboard to suit the soil where to be used. This mouldboard, of course, is made from soft-centre steel. "B" Sulky Plows enable you to get more work out of your horses without driving them to anything like the exhaustion the ordinary plow demands—even in tough, sticky soils—they will scour anywhere—wet ands have no terrors for "B" Sulky Plows. Why not let a "B" Sulky Plow, backed by the Belanger reputation, save money, time and horseflesh for you—why not buy your plow on the basis that you are going to make it earn enough extra to pay for itself?



This is the light draft "B" Sulky Plow

If your dealer does not sell "B" Plows, write us and we'll tell you where you can see them.

FILL OUT THE COUPON GET THE BOOK FREE

THIS book is an authoritative work on the preparation of the ideal seed-bed,—the foundation of good crops. To buy this book would cost you a dollar, but if you are really interested and will fill out the coupon as an evidence of good faith, we will send you one copy of the complete volume FREE. The story is told in three chapters, — "Soils and Fertilizer," "Plowing and Plows," and "Seeds and Seeding." Each chapter deals with its subject fully, tells the whole story and tells it in such detail that its genuine, practical value to the active farmer is unquestioned.

Your invested capital is your land—your great asset—and you cannot afford to waste it; this book tells you about the most modern methods of conservation — facts which you owe it to yourself to know.

effectively is somewhat costly. But the effect of spraying is such, if well and properly done, as to cause a material reduction of weed growth and promote a greater growth of grain. It also checks the ripening of seeds to infest the soil the following season. Many menacing weeds are not affected by the spray. Quack grass, wild oats, pigeon grass French weed and sow thistle appear to receive no set back from it. Chemicals that would be effective on them would be injurious to grain.

Cultivation of fields soon after harvest, which may be economically done with a disc harrow, will cause many weed seeds to germinate in the fall to be subsequently destroyed by frost. Weeds thus started may also be plowed under, where they will add to the soil fertility. Fall pasturing has proved destructive to weeds; especially where sheep have been given free range. Quick growing crops, like barley, are valuable in smothering the growth of weeds. Not needing to be sown early, barleaves an opportunity for much dragging and cultivation after weeds have germinated in the spring. The soil thus warmed, the tender weed roots are exposed to the killing effects of atmosphere and sun, the barley germinates and grows more rapidly than the weeds, because most of the weed seeds near the surface have been caused to germinate by the early cultivation and killed by later cultivation. Barley matures earlier than weeds and the systematic farmer may then cultivate his field, give the weeds a chance to germinate to be killed by the winter freezing or fall plowing. Winter rye is also a good crop with which to combat the weeds.—A. D. Wilson, Superintendent Extension Division and Farmers' Institutes, University Farm, Minn.

Paris Green on the Cabbage Plnt.

A Shippensburg man who has been using paris green to kill the worms that have appeared on the heads of cabbage in his garden wrote to Prof. H. A. Surface, Pennsylvania state zoologist, asking whether the poison will render the cabbage unfit for use. The professor answered the letter as follows:

"It will not render cabbage unfit for use to apply paris green to it. You can use one-half pound of paris green to fifty gallons of water sprayed on cabbage, and it will kill the worms and not injure the cabbage for food. Apply some soap to it to make it stick. Also, you can use two pounds of arsenate of lead in place of paris green. This will stick better and I much prefer it.

I have heard that from one-half ounce to one ounce of alum dissolved in each gallon of water will destroy the cabbage worm. I have not have opportunity to try it in my experimental work, but hope to do so soon. I would recommend that you try it and report to me results. I can assure you that practically all truck growers now use arsenical poison on cabbage and are satisfied with the results, as it kills the worms, although, of course, it does not kill plant lice, and it is not recommended for this. For aphids or plant lice I recommend one pound of Whale oil soap in five gallons of water.

Cabbage heads grow from within outward, thus they are constantly throwing out or spreading the leaves to which the poison has been applied. If it headed by throwing the outer leaves inward there would be greater danger of poisoning."

Apple Grading at Hood River.

J. L. Hills, in the seventh annual report of the Vermont Agricultural Association, says that one of the most interesting and significant features of Hood River apple growing is the grading of the fruit by Hood River Fruit Growers' Union. This is not a union in the opprobrious sense of the term. There is no compulsion. Some of the apple growers do not belong to it; but over 90 per cent. of the orchardists hold membership.

The rules of this organization are very strict in certain matters and particularly so as to the grading. Each orchardist picks his own apples, but the moment they have been passed from the tree into the pick-basket, or from the basket or pail to the storage house, he ceases to exercise control over them. They go then into charge of the agents of the union.

John Smith grows his apples, but John Smith has absolutely no more to do with the grading of his own property than has the King of the Cannibal Islands. If he presumes in any way to criticise the grading of the union's agents, the presumption is against him and not against the grader. In other words, his complaints are stopped immediately and automatically.

Moreover, the grading, being the work of disinterested experts, is done in a uniform manner. There is no temptation to defraud the ultimate consumer, as is so notoriously common in the packing of eastern apples. Furthermore, in grading and packing, marks are placed upon the lots or boxes indicating by letter, number or some cabalistic sign what individual did the work.

The union employs traveling agents who appear unexpectedly and who check up the grades and packs. If, by any chance, this traveling representative find graders unduly favoring any individual, or doing ought but exact justice, they are warned once and discharged on a second offense. Every effort is made in this way to secure uniform grading and to remove the temptation to sell an inferior product at the price of superior wares.

This system has resulted, so far as grading and packing is concerned in such absolute uniformity and such complete standardization, that it is customary now to sell carloads of Hood River apples in transit and on the statement of the grade as offered by the union. Large lots pass from hand to hand in sales without a single box being opened, and with complete assurance as to the grade being up to the guaranty.

Wash Your Clothes In The Easy Way

Wash them in the "Puritan" way. No rubbing—no tired arms—no aching back—no scalded hands and face. Fill The "Puritan" with warm, soapy water—put in the soiled clothes—start the "Puritan" going—and in five minutes, the clothes are ready to hang.

That's the "Puritan" way—the easy way to wash clothes. Make it your way.

Churn your Butter in the easy way with a "Favorite" Churn. 69

Write us if your dealer cannot supply the "Puritan" Washer and "Favorite" Churn. We will see that you are promptly supplied.

DAVID MAXWELL & SONS, - ST. MARY'S, ONT.

A Windsor Lady's Appeal.

To All Women: I will send free with full instructions, my home treatment which positively cures Leucorrhoea, Ulceration, Displacements, Falling of the Womb, Painfull or Irregular Periods, Uterine and Ovarian Tumors or Growths, also Hot Flushes, Nervousness, Melancholy, Pains in the Head, Back or Bowels, Kidney and Bladder troubles, where caused by weakness peculiar to our sex. You can continue treatment at home at a cost of only about 12 cents a week. My book, "Woman's Own Medical Adviser," also sent free on request. Write to-day. Address Mrs. M. Summers, Box H 309, Windsor, Ont.

MAIL CONTRACT.

SEALED TENDERS addressed to the Postmaster General, will be received at Ottawa until noon, on Friday, the 7th October, 1910, for the conveyance of His Majesty's Mails, on a proposed Contract for four years, one and three times per week each way, between Donegal, Waterford and Sussex, from the 1st of January next.

Printed notices containing further information as to conditions of proposed Contract may be seen and blank forms of Tender may be obtained at the Post Office of Donegal, Waterford, Sussex and route offices and at the Office of the Post Office Inspector at St. John.

FLORICULTURE.

A. R., of St. John., writes: "I am taking advantage of your notes to ask for directions as to proper method of growing Frusias in the house. I have some to plant and would like a few later ones. How can they be obtained?"

Fruesia bulbs can be obtained in September and should be planted as soon as possible. They do not require to be placed in the dark as do the Dutch bulbs but may be grown in any fairly cool, light window. When the grass-like leaves are about an inch high they should be tied to short wire to support the bulbs, which are very heavy in proportion to the size of the stalks. If particularly fine blooms are required, a little liquid manure, as soon as buds appear, will be of great assistance. To, have later blooms, keep a few bulbs out of the soil for a few weeks in a cool dry place.

Wash your palm occasionally with Castile soap and keep the leaves fresh and green. "Cleanliness is next to godliness," applies quite as much to plants as to humans.

Speaking of insects on palms, the writer's attention was recently called to the mealy bug on a plant that was alone in a room and had not been out of it for months. The only possible chance of them becoming infested with this pest was the placing a vase of chrysanthums close to it during one night. This is indeed the only practical solution of the mystery and should be a warning not to place cut blooms close to growing plants.

There is no better blooming plant than the Primrose; the Chinese varieties are now coming to their blooming period and are without doubt the most satisfactory house Primrose as they like cool rooms, partial shade, moisture and no water in saucer. They are very easily grown, if the drainage is good and no water gets into the crown of the plant. Water should only be applied to the edge of the soil next the pot, never slopped over the leaves and crown of the plant. Beautiful shades of lavender can be obtained in this family as well as the old reds and pinks and white.

Don't neglect to cover all hardy plants, shrubs and vines. Cover Boston Ivies with brush, as high up as you can, and give them a good mulch of manure. The Crimson Rambler and Dorothy Perkins improve so much with this treatment they are such good bloomers.

In planting bulbs or perennial plants, carefully remove any vegetable matter, that would decay quickly, such as the dead leaves of weeds, from their immediate vicinity. Unless this is done, the bulbs and roots are also likely to be affected.

Do not cut tops of Peonies unless you are transplanting them, their own leaves are a splendid aid to wintering.

Don't prune roses in fall, spring is the better time.

A. N., St. John, writes: "My palm is growing nicely but the leaves are very short stemmed. It has a good, light window with even temperature and good care. The plant seems to be perfectly healthy, the only trouble is that of short stems. What is the cause of this and what can be done to correct it?"

Palms that have been grown in a crowded greenhouse are drawn up naturally, as the close proximity of their neighbors prevent a short latural growth; the light is also from the top but when taken into a house when they have plenty of room to spread, with side light instead of top light, they have no need of growing so high and so spread their fans with much shorter stems. A good rich soil with more light will overcome the difficulty.

Telegraphy A Profession with a Demand Far in Excess of the Supply.

This demand is caused by the enormous amount of railroad building going on in Canada and yet Canada is only just beginning to build her railroads. To those who are ambitious telegraphy offers a brilliant future.

Hundreds of new Telegraph offices will be opened on the **Grand Trunk Pacific** next summer.

Railroad Telegraphy as a Young Man's Opportunity.

So begin **NOW** and study this Profession which pays **$50.00 to $75.00** a month to start on. Full particulars by return mail. Address:

Great Trans-Pacific School of Telegraphy and Railroading,
W. T. LITTLE, Principal, - FREDERICTON, N. B.

NET PROFITS.

At the end of the year are greatly increased when you use a **"LONDON"** gas or gasoline engine.

Runs day or night, winter or summer.

On the lightest kind of work saves one man's wages.

Send for Catalogue 18G, gives particulars.

London Gas Power Co., Limited, London, Canada

Formerly Scott Machine Co., Limited.

Don't waste your money buying plasters when you can get a bottle of Chamberlain's Liniment for twenty-five cents. A piece of flannel dampened in this liniment is superior to any plaster for lame back, pains in the side and chest, and much cheaper. Sold by all dealers.

Dominion Exhibition.

(Continued from page 734.)

in regard to popularity in Canada, as well as in the United States. Exhibitors in this department came from far away Ont., Quebec and P. E. Island, and Nova Scotia, were well represented by leading breeders, but naturally the great bulk belonged to New Brunswick.

The Asiatic class was better represented at this show than it has been for years. Many magnificent specimens of Light and Dark Brahmas were shown as well as Cochins and Langshans.

In the American class great interest was taken in the Barred Plymouth Rocks. The winners were a strong class, despite the fact that most all the old birds were in moult and a bit rough. The young classes had some well developed birds of good merit and the winners were an attractive lot.

Most of the Wyandotte families were well represented. The Whites far out-classed the rest. It is doubtful if ever better White Wyndottes were shown at a fall show in Eastern Canada. First hen, cockerel and pullet are wortby of special mention for quality and condition.

The Rhade Island Reds was the largest class in the whole show, which speaks their great popularity. Competition was red hot and no winner had a "cinch."

Leghorns were out in force and the contest was keen in both whites and browns with quality to burn.

Some grand old Minorcas were shown. While the young stock was good they were not hatched as early as usual.

Spanish and Andalusians had many entries and made a nice show. English breeds were out stronger than ever. Orpingtons, Dorkings and Red Caps made a big feature in their classes. Never before in the Maritime Provinces, was there such a show of all the Polish varieties.

Mr. J. H. Warrington, Cornwall, Ontario, came down with a car load of the "strictly fancy" stuff and along with his genial self were a whole show in themselves. He is a good fellow to meet and will be always welcome. For want of space it will be impossible to tell of the Hamburgs, French Breeds, Games, and Ornamental birds. There were Bantams by the hundreds. They all made a most pleasing and interesting display and lent variety to the show.

Geese, Ducks and Turkeys were out in goodly numbers and showed plenty of class.

Mr. W. A. Jack was superintendent and had a good corps of attendants and gave good care and attention to both exhibits and exhibitors.

Mr. A. C. Smith placed the awards with his usual care and ability. His work gave general satisfaction, except in a few sections where a mistake might easily be made in so many classes. The poultry show on a whole was a great success.

DAIRY PRODUCTS.

The dairy products class was far from being satisfactory. New Brunswick cheese was conspicuous by its absence. Prince Edward Island made a good showing in the cheese section. Butter, in its various form of packages was not as attractive as it might be.

L. C. Daigle, Dairy Superintendent, had charge of this department. The butter making competition was not well patronized by makers; but the few who did take part, made matters interesting for the visitors who watched them at their work.

A showing of particular interest was the "Made in St. John" exhibit in the Agricultural Hall. Many visitors, and city people, too, were heard remarking that they did not know so many different kinds of goods were manufactured in St. John. St. John did well in this respect and the showing was a good advertisement for the manufacturers.

The Dominion Exhibition for 1910 is over and the various exhibitors have either returned to their respective homes or have hied off to other fairs, where they will meet new competitors and win fresh laurels.

Dominion Exhibition Prize List.

Horses.

THOROUGHBRED HORSES.

Stallion, 4 yesrs and upwards—1 George W. Fowler, Sussex, N. B.; 3, Canadian National Bureau of Breeding, Montreal.

Filly, yearling—1, A. A. Laflin, St. Stephen, N. B.

Mare, 4 yrs. and upwards—1, Norman McLeod, St. John West, N. B.; 2, A. A. Laflin.

Brood Mare with foal—Hartland Poultry Yards, Hartland, N. B.

Foal of 1910—Hartland Poultry Yards.

STANDARD BRED HORSES.

Stallion 4 yrs. and upward—1, W. J. Alexander, St. John; 2, R. A. Snowball, Chatham, N. B.; 3, Alex. Clark, St. John.

Filly, 2 yrs. old—1, H. R. McMonagle, Sussex Corner, N. B.; 2, S. T. Lamb, Perry Point, N. B.

Yearling Filly—1, H. R. McMonagle; 2, S. T. Lamb.

Mare, 4 yrs. and upwards in harness—1 and 2, H. R. McMonagle.

Brood Mare with foal—1, Alex. Clark.

Foal of 1910—1, Alex. Clark.

HACKNEYS.

Stallion, 4 yrs. and upwards—1, T. B. McAuley, Hudson Heights, Que.

Stallion, 3 yrs. old—1, R. W. Snowball, Chatham.

Stallion, one yr. old—1, R. A. Snowball; 2, T. B. McAulay.

Stallion, any age—1, T. B. McAulay.

Yearling Filly—1, R. A. Snowball; 2, T. B. McAulay.

Brood Mare with foal—1, R. A. Snowball; 2 and 3, T. B. McAulay.

Foals of 1910—1 and 3, T. B. McAulay; 2, R. A. Snowball.

Special prize offered by Canadian Horse Society.

Best Stallion, any age or height, shown on line—1, T. B. McAulay.

Best Mare, any age, shown on line—T. B. McAulay.

CARRIAGE AND COACH HORSES.

Stallion, 4 yrs. old and uuwards—1, W. J. Alexander; 2, H. C. Jewett, Fredericton; 3, W. H. Keys, St. Stephen, N. B.

Stallion, 2 yrs. old—1, Hugh Payne, Hillsdale, N. B.

Stallion, any age—W. J. Alexander.

Gelding, 3 yrs. and upwards— John Wood, St. John.

Brood Mare with foal—R. T. Haines, Bartibogue, N. B.

Foal of 1910—R. T. Haines.

Single Carriage Horse, over 15½ hands in harness—1, DeB. Carritte, St. John.

Best Carriage Horse in New Brunswick, Silver Cup doanted by Geo. McAvity, St. John—1, DeB. Carritte.

ROADSTER HORSES.

Brood Mare with foal—1, Orin Hayes, Sussex, N. B.

Foal of 1910—Orin Hayes.

Mare, 3 yrs. and under—1, John F. Frost, Hampton, N. B.

CLYDESDALES.

Stallion, 4 yrs. and upward—1, T. B. McAulay; 2, H. C. Jewett, Fredericton; 3, Logan Bros, Amherst Point, N. S.

Stallion, 3 yrs. old—1, R. A. Snowball; 2, Meadwell Hoben, Maugerville, N. B.; 3, H. R. McMonagle.

Stallion, 2 yrs. old—1, H. C. Jewett.

Stallion, 1 yr. old—1, Logan Bros.

Filly, 3 yrs. old—1, John Barton, Welsford, N. B.

Filly, 2 yrs. old—1 and 2, Logan Bros; 3, C. P. Elanchard, Truro, N. S.

Filly, 1 yr. old—1, Logan Bros.

Brood Mare with foal—1 and 3, R. A. Snowball; 2, Logan Bros.

Foal of 1910—1 and 3, Logan Bros.; 2, R. A. Snowball.

Clyde Mare, any age—1, R. A. Snowball; 2 and 3, Logan Bros.

Pair Clyde Mares—1, R. A. Snowball; 2, Logan Bros.

Special Prizes offered by the Clydesdale Association of Canada.

Best Clydesdale Stallion, any age—1, T. B. McAulay.

Best Clydesdale Female, any age—1, R. A. Snowball

Best Clydesdale Stallion, bred in Canada—1, R. A. Snowball.

Best Clydesdale Female bred in Canada—1, Logan Bros.

Best team, mares or geldings, sired by stallion registered in Clyde records—1, R. A. Snowball.

Special Gold Medals by Clydesdale Horse Society of Great Rritain and Ireland.

For best Clyde Stallion—T. B. McAulay.

For Best Mare or Filly—1, R. A. Snowball.

PERCHERONS.

Stallion, 4 yrs. old and upwards—1, Mathurin Horse Co., St. John; 2, Jamieson & Walker, Sussex Corner; 3, D. W. McKenzie, Nerepis Station, N. B.

Stallion, 1 yr. old—1, Chas Symes, Minudie, N. S.

Stallion, any age—1, Mathurin Horse Co.

Filly, 3 years old and upward1— Chas.s.Symes.

Foal of 1910—1, Geo. F. Mayes, St. John; 2, Geo. A. Chamberlain.

DRAUGHT HORSES.

Best Draught Gelding or Mare, any age or weight—1, J. Pender & Co., St. John.

GENERAL PURPOSE.

Single Horse, gelding or mare—1, James Barrett & Sons; 2, Dave Love, St. John; 3, J. McDonald, Jr., Woodside.

Bank of N. B. Special Cup—James Barrett & Sons.

PONIES.

Pny in harness, 12½ hands and under—1, Miss Constance White, St. John; 2, Arthur Schofield, Hampton.

Pony in harness, 12½ to 14 hands—1, W J. Alexander.

HARNESS HORSES.

Single Roadster, trotter, gelding or mare, 15.3 hands and under—1, S. S. Wetmore, Clifton, N. B.

Single Pacer, gelding or mare—1, P. H. Nugent, St. Martins, N. B.; 2, John Buckley, Rogerville, N. B.

SPECIAL HEAVY HARNESS CLASS CARRIAGE HORSES. 6

Single Horse, 16 hands or over—P. H. Nugent.

Single Horse, 15.2 hands and under 16 hands—1, H. C. Jewett.

Single Horse, 15 hands and under 15.2 —1, T. B. McAulay; 2, DeB. Carritte.

Pair Horses 15.2 hands and under 16—1, T. B. McAulay.

Progeny of Government imported horses—1, A. A. Laflin; 2, Norman MacLeod; 3, Hartland Poultry Yards.

SADDLE HORSE

Ladies' Saddle Horse, over 14,2, ridden by a lady, 1, S. S.Wetmore.

COMMERCIAL.

Single delivery horse, for bakers. confectioners, etc , 1, I. B. Taylor, 2, F. E. Wilkins.

Silgle Horse heavy express general delivery. 1, J. E, Pender & Co.; 2 and 3, Dominion Express.

Beef Cattle.

SHORTHORNS.

Bull, 3 yrs. old and upwards—1, C. A. Archibald, Truro, N. S.

Bull, senior, yearling—1, R. A. Snowball.

Bull, senior calf—1, R. A. Snowball; 2 and 3, C. A. Archibald.

Bull, junior calf—1, C. A. Archibald.

Senior Champion male—1, C. A. Archibald.

Junior Champion Male—R. A. Snowball.

Junior Reserve Champion Male— R. A. Snowball.

Grand Champion Male—C. A. Archibald.

Grand Reserve Champion Male—R. A. Snowball.

Cow, 4 yrs old and upward—1, 2, 4, C. A. Archibald; 3, R. A. Snowball.

Cow, 3 yrs. old—1, 2 and 3, C. A. Archibald; 4,R. A. Snowball.

Cow or Heifer, 2 yrs old—C. A. Archibald.

Heifer, senior, yearling—1, C. A. Archibald; 2 and 3, R. A. Snowball.

Heifer junior yearling—1 and 2, C. A. Archibald.

Heifer, senior calf—1 and 2, R. A. Snowball.

Heifer, junior calf—1 and 2, C. A. Archibald.

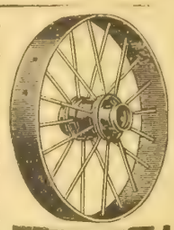
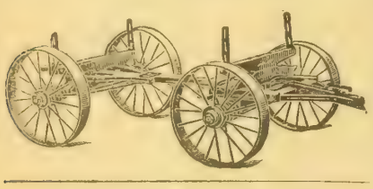
The One Wheel—The One Wagon



Dominion Low Wide-tire Steel Wheels are made on principle of bicycle wheels. Unlike wooden and other wheels, the Dominion distributes strain equally. Dominion Low Wide-tire Steel Wheels are stronger, lighter and cheaper than wooden wheels. Have staggered spokes. So unlike wooden wheels, they will not rot or easily break. Dominion wheels will carry all horses can draw. Wide tires save roads and horses, and reduce loading labor and time. Can be taken apart and repaired, if necessary. Guaranteed not to break in even coldest weather or on rockiest roads.

Our Handy Wagon saves you so much labor and time that it pays for itself the first year. Yet it will last a lifetime. It makes loading and unloading easier. Its wide-tire steel wheels save roads and horses' strength. Strong enough to carry all horses can pull. Made of finest material; best workmanship; neat appearance. Write for free catalogue on Handy Wagon and Steel Wheels.

Dominion Wrought Iron Wheel Co., Ltd., Orillia, Ont.



SEALED TENDERS addressed to the undersigned and endorsed "Tender for Extension to Breakwater, Richibucto Cape, N. B.," will be received at this office until 4.00 P. M., on Wednesday, October 5 1910, for the construction of an extension to breakwater at Richibucto, Kent County, N. B.

Plans, specification and form of contract can be seen and forms of tender obtained at this Department, at the offices of E. T. P. Shewen, Esq., District Engineer, St. John, N. B.; Geoffrey Stead, Esq., District Engineer, Chatham, N. B., and on application to the Postmaster at Richibucto, N. B.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and signed with their actual signatures, stating their occupations and places of residence. In the case of firms the actual signature, the nature of the occupation and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Honourable the Minister of Public Works, for the sum of two thousand three hundred ($2,300.00) dollars, which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By order,

R. C. DESROCHERS,
Secretary.

Department of Public Works,
Ottawa, September 12, 1910.

Newspapers will not be paid for this advertisement if they insert it without authority from the Department.

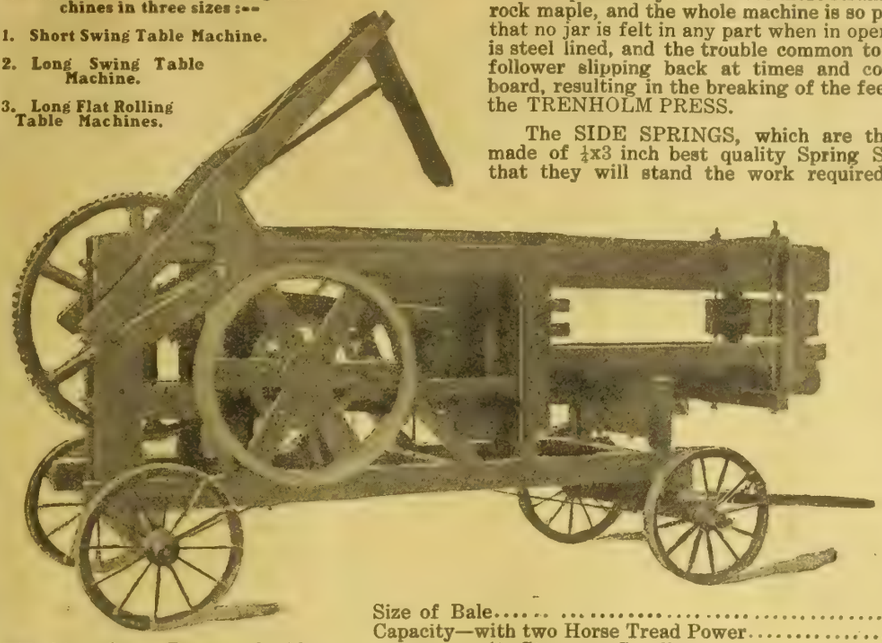
The Improved Trenholm Gear Hay Press

We manufacture Wood Cutting Machines in three sizes :—

1. **Short Swing Table Machine.**
2. **Long Swing Table Machine.**
3. **Long Flat Rolling Table Machines.**



The parts subjected to the most strain are built of seasoned rock maple, and the whole machine is so powerfully constructed that no jar is felt in any part when in operation. The bale box is steel lined, and the trouble common to most presses, of the follower slipping back at times and coming under the feed board, resulting in the breaking of the feed arm is unknown in the TRENHOLM PRESS.

The SIDE SPRINGS, which are thoroughly tested, are made of ¼x3 inch best quality Spring Steel. We guarantee that they will stand the work required of them.

The FOLDER is properly located to do perfect work with ease and requires but a very slight spring pressure to operate. Every bale will be uniform in weight and neatly folded.

This machine will do more work with less power than any other on the market. The truth of this assertion has been proven in all parts of Eastern Canada.

Size of Bale	14x18 inches
Capacity—with two Horse Tread Power	1½ tons per hour
" Steam or Gasoline	3 " " "
Weight	400 pounds
Dimensions—Length of Sills	10 feet, 8 inches
Width outside of Sills	4 feet, 1 inch
Dimensions of Pulley	Diameter 42 inches; face 5 inches
Speed	105 to 110 Revolutions per minute

KENDALL'S SPAVIN CURE

To Bring Him Back to the "High-Stepping" Class

THE REMEDY USED ALL OVER THE WORLD

For Spavin, Curb, Splint, Ringbone, Soft Bunches, All Lameness

Horse dealers have made thousands of dollars by buying Lame, Spavined Horses, curing them with Kendall's Spavin Cure, and then selling the sound animals at a handsome profit.

You can do the same with your own horses. Here is one man who saved his horse and his money by using Kendall's.

Oak Bay Mills, Que., Dec. 15th, 1909

"I wish to inform you that I have used Kendall's Spavin Cure with good success, on my horse. I found that it cures quickly and well". Yours truly, ROY HARPER.

$1. a bottle—6 for $5. A copy of our book—"A Treatise On The Horse"—free at dealers or from us. 48

Massey-Harris Cream Separator

The cleanest skimmer under all conditions—because it has greater skimming surface and because of the uniform distribution of the milk by the improved split wing.

Easy to Fill
Because of the low supply can.

Easy to Turn
Because milk is speeded up at centre of bowl, because of the easy-running ball bearings and because of the smooth running gears.

Easy to Clean
Because everything is easy to get at.

Self Balancing Bowl
Spins like a top at its own centre of gravity.

Patent Brake Attachment
Stops the bowl quickly.

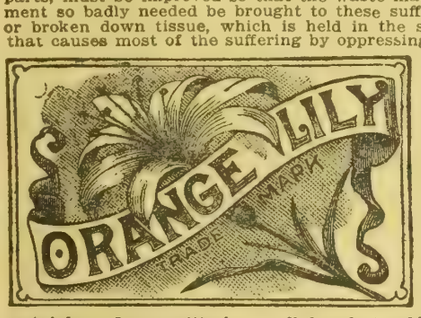
An Object of Pity

That part of our nature which we call the emotional is much more highly developed in women than in men. They are more sensitive, more tender, more sympathetic, more pronounced in their likes and dislikes, more susceptible to the extremes of pleasure and pain; and these refined mental qualities, no less than beauty of form and feature, make up the atmosphere of attractiveness and charm which always surrounds true womanliness.

The continued existence of these winning, engaging womanly characteristics depends to a very large extent on the regularity of the womanly functions and the condition of the womanly organs; and when these functions and organs become disordered or diseased the same mental qualities which are the glory of a well woman become the source of suffering and torture almost indescribable. Her cheery hopefulness is changed to a feeling of despondency, almost of despair, and she is haunted with forebodings of worse evils to come. Instead of being entertaining and companionable, she becomes moody and irritable, being unable to keep her mind from dwelling on her troubles. She becomes morbidly sensitive, imagining that she is being slighted or foresaken by her relatives and friends and she has a most humiliating sense of her miserable condition and of her loss of her womanly attributes. If she is religiously inclined she is very liable to be oppressed with doubts and fears in regard to her spiritual condition, or to think that she is eternally lost. In addition to this, she has also to endure the most distressing aches and pains.

What makes the case still more pitiable, especially with married women, is the fact that few men understand or appreciate the extent of their suffering, or the seriousness of the troubles causing it. Many doctors even speak of these disorders as subjects for ridicule, and the poor sufferer often gets a reputation for being a crank or a scold when she more nearly approaches being a martyr.

As these disorders are due to a disordered condition of the womanly organs, it is evident that to effect a cure these organs must be restored to normal condition; or, in other words, the circulation, which has become congested and stagnant in these parts, must be improved so that the waste matter will be expelled, and the nourishment so badly needed be brought to these suffering organs. It is the waste matter, or broken down tissue, which is held in the stagnant blood vessels in these parts, that causes most of the suffering by oppressing the nerves located in these parts.



The remedy known as ORANGE LILY will positively relieve this congestion and restore normal circulation in the disordered organs. It is an applied or local treatment, and acts wholly on these parts. It is absorbed into the blood vessels in these organs, and as it has powerful antiseptic properties, it immediately acts on the waste matter held there, and causes it to be discharged. As this dead matter is discharged the nerves are relieved, the pains and mental troubles become less, and the nerves and blood vessels become stronger. ORANGE LILY thus proves its merit by actual, visible results. It acts as certainly and as positively on all female troubles as anti-toxin does on diphtheria.

Winnipeg, April 28th, 1909.

Dear Mrs. Currah,—I am very grateful to ORANGE LILY for the change it has made in my life. When I commenced its use eight months ago I felt I would be surely insane before the year was ended. The pain I suffered often made me wish for death, and besides I would have such fits of depression and nervous twitching that I would have to scream. I had doctored with three different doctors for over two years, and had also used both the Pierce and Pinkham medicines, but none of them seemed to reach my case. I felt some improvement after the first month's use of ORANGE LILY and have kept gaining ever since. I do not feel that I am entirely cured yet, but I am so much better than I was that I am sure I will soon be entirely well. I sleep well, and feel cheerful and happy, except that I am occasionally somewhat depressed, but these spells are getting fewer and milder. I have also noticeably improved in appearance. Enclosed find $3 for which please send me two boxes of ORANGE LILY and one of Cerate Massage. I might add that the matter which used to be freely discharged, and which looked like a chicken's gizzard, is becoming very scant, and I imagine that the circulation is pretty well restored. Am I not right in this? Your sincere friend, MRS. L. E. A.

Free to all Sufferers

In order to enable every woman suffering from any form of female disorders to test the merits of ORANGE LILY, I will send to everyone who will send me her address, or the address of any suffering friend enough of the remedy for ten days' treatment, absolutely free. As this is worth 35c. it is only because I know that it must give relief that I make this free trial offer. Further, if any woman wishes expert medical advice, and will write me a full description of her case, I will submit same to the staff of the Coonley Medical Institute, Detroit, Mich., and they will write her direct without expense to her. INCLOSE THREE 2-CENT STAMPS and address MRS. FRANCES E. CURRAH, WINDSOR, ONT. 2

1 Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only one cent a word, you can advertise anything you wish to buy, sell or exchange. The address must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issue. No black faced type or display of any kind will be allowed under this head, thus making a small ad, as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

WANTED.—Hides, calfskins, sheep and lamb pelts, J. J. McLEAN & SONS, Hopewell, N. S.

DR. J. WOODBURY'S HORSE LINIMENT

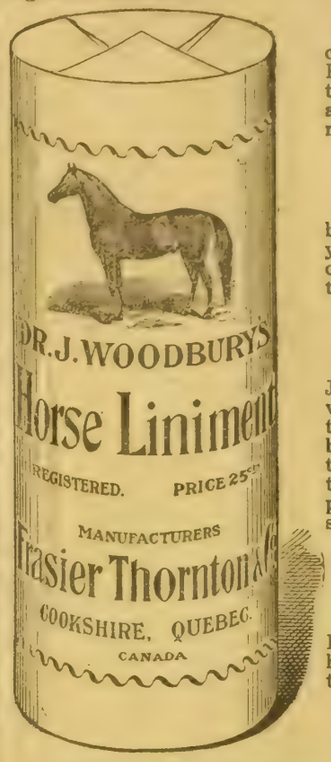
INFALLIBLY THE REMEDY

For the removal of Splints, Bog Spavins, Enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough, Enlargements of the Glands, Affections of the Kidneys. For Distemper, Strangles and Colic it is infallibly the remedy.

All horses that are stabled should have an application of Dr. J. Woodbury's Horse Liniment to the hoofs of the fore feet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured.

Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions.

Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.



Bear River, N. S.

Dear Sirs:—We do not hesitate in recommending your Dr. J. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts, and would say that no lumberman should be without it. Yours truly,

CLARKE BROS.

Hubbard's Cove, N. S.

Dear Sirs:—I have used Dr. J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use. Yours truly,

C. C. McLEAN.

Truro, N. S.

This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung diseases. It is the best thing to give horses in the spring to keep them in condition. It purifies the blood, cleanses the lungs from impurities, which may exist, and gives the system healthy action.

NEWTON LEE,
Owner "All Right," 5817.

Elmsdale, N. S.

Dear Sirs:—Kindly send me 6 dozen Dr. J. Woodbury's Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take.

Yours truly,
ELMSDALE MERCANTILE CO.,
Elmsdale, N. S.

Dear Sirs:—I cured my horse with Dr. J. Woodbury's Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse.

Yours truly, H. R. WHITEHEAD.

Dear Sirs:—One of my horses had a bad cough, and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months' standing. In my large experience with horses, I consider this liniment to be the best made for all diseases in the horse, and I recommend it to my friends. E. J. ANDERSON, Truro, N.S.

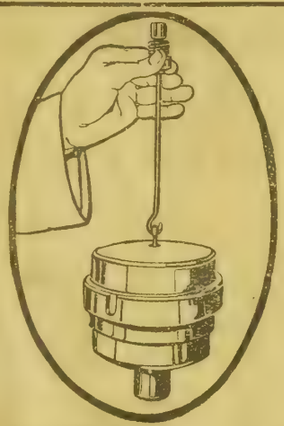
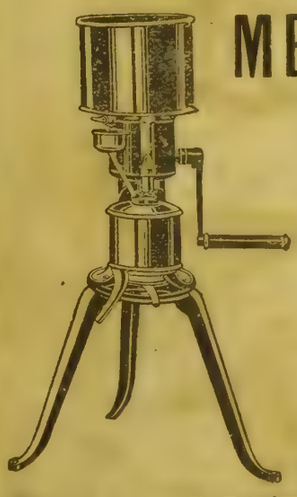
We Make No Claims For The MELOTTE CREAM SEPARATOR That Actual Experience Has Not Borne Out.

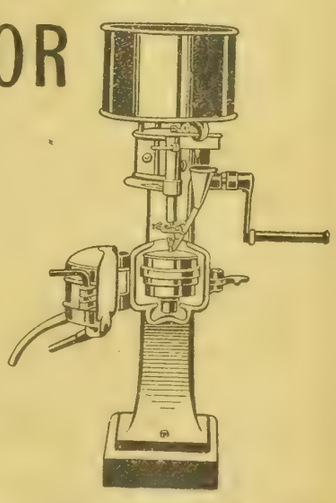
SO when we say that the Melotte Cream Separator actually does skim closer, run easier, stand hard usage better than any other Separator, and make five cows equal to six the old way, we are not making mere advertising statements—we are giving you the actual facts proven on thousands of Canadian farms.



THE Melotte Separating bowl, the only suspended bowl, is larger than others, and is absolutely self balancing, having no inside lumps of balancing solder. It is practically frictionless on this account. Now, friction saved means labor saved, and wear on parts saved. **That,** in a nutshell, is the secret of the durability of the Melotte Cream Separator.



MELOTTE CREAM SEPARATOR



Nearly Fifty Thousand have been sold and are in use in the last ten years.

MR. FARMER—The Melotte Cream Separator will earn big money for you. We want you to try the Melotte Cream Separator, on your own farm, at your leisure, by yourself. The "experts" and agents can all run Separators, of course, but what we want you to do is to try the Melotte for yourself. See how simple it is to understand—see how little labor it needs—see how well it does its work—see for yourself, in a glance, the marvellous efficiency of the self balancing separating bowl—the bowl that makes the "Melotte" famous.

Just write us and we'll make you an offer—the best offer you ever had.

Farmers of Quality

Stationary and Mounted, in 1 1-2 to 30 Horse Power.

Want Quality!

Readers of THE MARITIME FARMER are of the quality stamp; we realize their discerning ability to pick an article of machinery that is correct in every mechanical detail. That is the reason why such care is taken to see that the **Ideal Gas and Gasoline Engines** are what we claim for them.

Every part of the "**Ideal**" is interchangeable—a mighty strong feature. The cylinder, instead of being cast with the base, is cast separate and bolts on the base. The valves, instead of sealing directly on the cylinder head are enclosed in a valve cage, and the valve cage is inserted in the cylinder head, so that when the valves become worn, the valve cage and valve can be taken out and ground without removing the cylinder head.

The idea of casting the cylinder separate from the base is a good one, for when the walls of the cylinder become worn, you don't have to buy a complete new engine, you only require a new cylinder that can be bolted on the base. Another good feature is an extremely long piston with double rings instead of using three rings. We use three sets of two rings each on the Ideal.

Another thing, there is a speed regulator on this engine which enables you to run the engine at any speed, and, of course, when you reduce the speed of the engine, you also reduce the fuel consumption. For instance, if a man had a 6 H. P. engine and wanted to run a cream separator with it, he could reduce the speed and thereby cut down his fuel consumption to suit the work.

All these are points to consider when looking for a gasoline engine of quality—one that stands without a peer.

"**Ideal**" **Gas and Gasoline Engines** are built on honor and built to give their operators satisfaction, and they do it. We do not build a cheap or low grade engine, but do cater to that class of buyers who wish a first class article at a reasonable price.

Health Versus Money.

Attention is called to this advertisement so that you may know where the famous Oxygenator may be secured.

The marvellous machines (which by the way are creating a furore from the Atlantic to the Pacific) can be purchased or rented by applying to **Suite 20, Robinson Building, St. John.**

The Oxygenator is a machine that proves, by its successful record of the past 14 years, that by the use of Oxygen, and only Oxygen (transmitted through the pores to the blood) that it can and does cure disease.

No Drugs, Massage or Electricity used.

The machines last for life and may be used by each member of the family.

Hundreds in use now in the Maritime Provinces. A post card will bring you full information.

Telephone Main 2367. Lady attendants.

Extraordinary Opportunity ! To Buy a High Grade Gasoline Engine Cheap.

400 Standard Fairbanks-Morse Gasoline Engines.

To be sold at Wholesale Prices. Act quickly as the offer only holds good while they last.

THE REASON.

During the year 1909 over four hundred country Grain Elevators were erected in the North-West and in practically all of these houses were placed

Fairbanks-Morse Gasoline Engines.

We have manufactured and have ready for delivery in anticipation of this year's requirements.

100 5-Horse Power Engines. 150 8-Horse Power Engines.
100 10 " " " 50 12 " " "

Owing to unfavorable conditions there will be little elevator building and rather than carry them over another year we will sell them at great reduction as long as they last, as we haven't the room to carry them

Fairbanks-Morse Gasoline Engines are in use the world over. EIGHTY THOUSAND ENGINES having been sold to date. The Engines are the result of years of experience on all problems connected with Gas Engine Practice No Company in the world has spent as much money as Fairbanks-Morse & Co. on experimental and development work in connection with every type of Gas Engine.

The many thousands in use to-day stand as a guarantee of the absolute correctness of the principles involved, the high class of workmanship, careful selection of materials and the reliable and efficient service rendered by the finished machine

A record like this is based solely upon recognized merit.

YOUR OPPORTUNITY.
